Successful Mobilization

of the Nation's natural resources for war, like their conservation in time of peace, depends upon the cooperation of a citizenry fully informed as to the tasks confronting it and the progress made toward their solution.

¶ To meet this requirement, the Department of the Interior presents a streamlined emergency War Edition of the Secretary's Annual Report for the Fiscal Year 1942, sharply restricted in volume and stripped of illustrations and detailed statistical material to meet the exigencies of war economy demands.

Letter of Transmittal

The Secretary of the Interior

HAROLD L. ICKES, Secretary

MY DEAR MR. PRESIDENT: During the last 12 months, the Department of the Interior has been dedicated to a vigorous war program. In some phases of the task of harnessing our natural resources for war, we have been highly successful. In others, we have failed to attain the goals we should have achieved. But in the final analysis, we have made real progress.

It is worthwhile, it seems to me, at a time of crisis, to review our effort of the last year and to appraise our performance under fire, so that we may evaluate our progress and reset our sights. We entered the fiscal year under the stress of a defense program and ended it under the greater pressure of war. The task of this Department was to convert its custodianship of the Nation's natural resources from a peacetime administration to that of war use.

This was an eye-opening proceeding. For years, this Nation had been deluded with the idea that it was practically self-sufficient, that its industrial processes were the world's best, and that its supplies were practically inexhaustible. A painful hangover resulted from that spree. We woke up to find out that we did not have enough steel to do the job; we did not have enough aluminum; we were short of power; we lacked magnesium; our sources of manganese were too far away to do us much good; our supply of timber and lumber did not hold out; our fisheries and other food resources could not be operated on the old basis nor supply enough to meet demand; our coal supply became endangered and the chaos of war tied our petroleum service up into knots.

In short, we discovered, that so far as our natural resources were concerned, we had been doing everything in the easy way. We had, up to the last year or two, been skimming the cream—and the cream ran out. While the enemies we despised had been making the most of their meager resources—and making them do the job—we had constructed our whole economy on our fat. The former “had-not” nations turned to their secondary ores and low-grade minerals, and by sweat and effort learned how to use them. We neglected our secondary sources of supply—the low-grade deposits of minerals,

IV · *Report of the Secretary of the Interior*

for example—and went merrily on our way, using only the best, and therefore the most profitable. Then we discovered that we did not have enough of the best to meet our needs and that we must perforce proceed to the utilization of what we did have.

It was with this process of conversion that the Department of the Interior was chiefly concerned during the last year. The accumulated knowledge of our technical bureaus was put to work in as many directions as possible. New processes for ore treatment and metal extraction were devised and put into effect; new programs for the utilization of secondary deposits of minerals were effectuated, and some industries which had been accustomed to doing things the easy way were persuaded to try the hard way. It is in this connection that I cannot, with candor, assert that we have been successful. Our proposals for the complete utilization of certain domestic minerals, for example, did not meet with whole-hearted welcome. In some instances, temporary expedients seemed to be preferred by some groups to imaginative, full-scale adoption of novel, though proven, methods. We endeavored to work closely with the War Production Board in order that war industry might have the benefit of the work of our scientists and technical bureaus. The inertia of the old way, the weight of industrial tradition, the following of the established pattern, frequently induced heavy industries to postpone technical innovations. In my opinion, this was a postponement of the inevitable. Whether this postponement has been costly to the Nation in the long run remains to be seen.

For all of that, our efforts as a whole have been fruitful. With natural resources as our field, we early realized the need for drastic action in utilizing that which was within our reach, and the Department organized a definite war program with stated objectives for each bureau and agency. This drive was aimed at procuring the sinews for conflict—the metals, oil, power, fuel, helium, food, land, water, and timber available for war production and the equipment of the United Nations. Our activities increased and hastened production in the mines and in the mills; in the factories and yards where metals are processed and fabricated into planes, tanks, and ships; in the forests, on irrigation projects producing food and in the metallurgical laboratories. The program for discovery and exploration of new deposits of strategic and critical minerals was pushed vigorously with some encouraging results.

To stimulate the prosecution of war activities within the Department, we established a War Resources Council. This Council, composed of responsible officers of the Department, has coordinated our war work and has encouraged our bureaus to undertake programs which would contribute the most to the successful prosecution of the war and the production problems which are involved.

A few facts show the extent to which we have provided additional resources or led the way in wielding those at hand against the enemy with greater effect. Generating capacity on reclamation projects increased by 43 percent. From Columbia River projects alone, nearly 2,000,000,000 kilowatt-hours of power poured into war plants. By a process developed in our laboratories, it appears that enough manganese can be extracted from low-grade domestic ores to make 87,000,000 tons of steel annually. More than a million tons of bauxite, the common source of aluminum, and other valuable ores have been found in our search for strategic metals. In the course of increasing these essentials of war, we have laid the groundwork for further production during ensuing years of more power, more metals, more food; of more and better-mobilized natural resources of all kinds.

The soundness of the conservation policies put into effect by your Administration when it came into office is now clearly apparent. Our activities during the last year in mobilizing for war could never have been as effective if previous policies had been less sound. Pearl Harbor and the events that followed have taught us that speed in war means ready access for the Nation as a whole to its resources. For some time this Department has worked to clear the Nation's title to many resources where conflicting claims have arisen. These actions, and our general progress in encouraging the wise use of our natural heritage, constituted a long advance toward mobilization of our resources in this time of great peril.

Throughout our activities we have streamlined for war. Many of our normal activities, desirable and essential in times of peace, have been laid aside or deemphasized. War work has been given the right-of-way and the curtailment of many normal functions has been severe. Economies have been put into effect, even to the degree that they have become painful. This belt-tightening has been extended into such details of administration as the reduction of printing and the discontinuance or curtailment of publications. This report has been reduced in size and content in accordance with that policy, and represents a genuine war edition. The length of the report has been halved, and other economies have been effected in format and printing. Because of this, I will not report to you in as great detail as customary in this letter, but I do wish to call your attention to a few pertinent facts that emphasize such progress in the war program as we have made.

The Bureau of Mines

The Bureau of Mines in December 1941 greatly expanded its war program. Skilled engineers, chemists, metallurgists, statisticians, economists, and others intensified their activities and directed them

VI · Report of the Secretary of the Interior

toward putting idle mineral resources to work and speeding up the mine to metal cycle.

From the Bureau's laboratories and pilot plants emerged several new and better processes for treating strategic, critical, and essential ores; exploratory crews brought reports of new ore deposits which now are being developed; and the economists and statisticians assembled data to aid the Army, the Navy, the WPB, and other war agencies in their planning.

Meanwhile, the Bureau extended its program of promoting safety and efficiency in the mineral industries. This will conserve manpower and machinery and will help make secure from interruption the output of materials going into tanks, planes, ships, guns, and other equipment for the United Nations.

The Bureau's war plans utilized more than 30 years of experience and progress in the conservation and development of the Nation's mineral resources. To help offset the threatened curtailment of mineral imports from foreign countries, in cooperation with the Geological Survey, the Bureau in 1939 launched an investigation of domestic deposits of strategic minerals including antimony, chromium, manganese, mercury, nickel, tin, and tungsten. As the war spread throughout the world and the shipping situation became more acute, the Bureau's quest for domestic mineral deposits grew in importance and extent until it embraced virtually all of the important engineering metals. During the 1942 fiscal year alone, important reserves of chromite, manganese, mercury, tungsten, iron ore, bauxite, and alumina clay were charted.

Some of the indicated deposits were substantial. The estimated reserves of chromite were increased by 2,300,000 tons and production began in several areas. There were several discoveries of usable mercury and five findings of tungsten. Exploration for manganese ore of milling grade brought increases in reserves of more than 1,100,000 tons. In addition, more than 1,000,000 tons of workable bauxite were marked out and the exploration of five clay deposits pointed to 4,600,000 tons of ore containing 35 percent or more alumina.

In Alaska and in many of the ore-bearing districts of the Nation, the Bureau engineers faced adverse conditions and rough terrain to carry on their exploratory work of drilling, drifting, sinking, and trenching. By the end of the fiscal year, 740 deposits had been examined and rated.

Paralleling this work, metallurgists and chemists worked in laboratories and pilot plants devising methods of recovering metals from low-grade and complex ores. From these experiments it became known that substantial quantities of manganese, chromium, magnesium, and aluminum could be obtained from such domestic ores. Processes were developed for beneficiating ores containing antimony,

copper, iron, mercury, nickel, tungsten, zinc, and fluorspar, while methods were worked out for treating ores containing aluminum, cobalt, and magnesium.

Toward the end of the fiscal year, the Bureau reorganized its operating structure to place still greater emphasis on exploratory work, the development of additional metallurgical processes, and the utilization of these methods on a wider scale to bring idle ores into the production line. Examples of this program are the pilot plants for producing sponge iron and for reducing zinc ores with natural gas, together with an expansion of investigations in beneficiating low-grade bauxite ores, alumina-bearing clays, alunite and chromite, and in the production of electrolytic chromium and manganese.

Important gains also were registered in the field of nonmetallics during the year. On the basis of Bureau findings, the War Production Board made arrangements for the commercial production of flake graphite from domestic sources to overcome a shortage of the imported variety. The Bureau determined that some west coast sands could be treated and used in place of Belgian glass sand; it participated in the discovery of new sources of ceramic talc suitable for radio insulators; and conducted studies which revealed that certain volcanic rocks can provide workable substitutes for magnesite brick, a refractory material once imported from Austria and Greece.

Helium, the lightweight, noninflammable gas of which this Nation has a world monopoly, flowed in a greater volume from the Bureau's plant at Amarillo, Tex., in response to ever-increasing demands from the Army, Navy, and various Government and civilian agencies. To provide ample supplies of this gas for barrage balloons, blimps, and other uses, the production of the Amarillo plant established a new record and the Bureau began enlarging the facilities and constructing new plants.

Petroleum and natural gas engineers shouldered additional responsibilities as a direct result of the war. Laboratory research and field studies by petroleum engineers and surveys by Bureau statisticians gave war agencies detailed information regarding this Nation's ability to increase its output of aviation gasoline. The Bureau opened a new field office to stimulate crude oil production from the Appalachian fields. Other field offices marshaled their chemistry and refining experts to evolve solutions of technical problems in the field of petroleum and natural gas.

Looking to the time when our petroleum reserves may be depleted, the Bureau continued its research on the production of gasoline, fuel oil, and other byproducts from coal. New coals were tested and their suitability to liquefaction was determined. The Bureau made plans to study another process—the Fischer-Tropsch method—for pro-

VI · *Report of the Secretary of the Interior*

toward putting idle mineral resources to work and speeding up the mine to metal cycle.

From the Bureau's laboratories and pilot plants emerged several new and better processes for treating strategic, critical, and essential ores; exploratory crews brought reports of new ore deposits which now are being developed; and the economists and statisticians assembled data to aid the Army, the Navy, the WPB, and other war agencies in their planning.

Meanwhile, the Bureau extended its program of promoting safety and efficiency in the mineral industries. This will conserve manpower and machinery and will help make secure from interruption the output of materials going into tanks, planes, ships, guns, and other equipment for the United Nations.

The Bureau's war plans utilized more than 30 years of experience and progress in the conservation and development of the Nation's mineral resources. To help offset the threatened curtailment of mineral imports from foreign countries, in cooperation with the Geological Survey, the Bureau in 1939 launched an investigation of domestic deposits of strategic minerals including antimony, chromium, manganese, mercury, nickel, tin, and tungsten. As the war spread throughout the world and the shipping situation became more acute, the Bureau's quest for domestic mineral deposits grew in importance and extent until it embraced virtually all of the important engineering metals. During the 1942 fiscal year alone, important reserves of chromite, manganese, mercury, tungsten, iron ore, bauxite, and alumina clay were charted.

Some of the indicated deposits were substantial. The estimated reserves of chromite were increased by 2,300,000 tons and production began in several areas. There were several discoveries of usable mercury and five findings of tungsten. Exploration for manganese ore of milling grade brought increases in reserves of more than 1,100,000 tons. In addition, more than 1,000,000 tons of workable bauxite were marked out and the exploration of five clay deposits pointed to 4,600,000 tons of ore containing 35 percent or more alumina.

In Alaska and in many of the ore-bearing districts of the Nation, the Bureau engineers faced adverse conditions and rough terrain to carry on their exploratory work of drilling, drifting, sinking, and trenching. By the end of the fiscal year, 740 deposits had been examined and rated.

Paralleling this work, metallurgists and chemists worked in laboratories and pilot plants devising methods of recovering metals from low-grade and complex ores. From these experiments it became known that substantial quantities of manganese, chromium, magnesium, and aluminum could be obtained from such domestic ores. Processes were developed for beneficiating ores containing antimony,

copper, iron, mercury, nickel, tungsten, zinc, and fluorspar, while methods were worked out for treating ores containing aluminum, cobalt, and magnesium.

Toward the end of the fiscal year, the Bureau reorganized its operating structure to place still greater emphasis on exploratory work, the development of additional metallurgical processes, and the utilization of these methods on a wider scale to bring idle ores into the production line. Examples of this program are the pilot plants for producing sponge iron and for reducing zinc ores with natural gas, together with an expansion of investigations in beneficiating low-grade bauxite ores, alumina-bearing clays, alunite and chromite, and in the production of electrolytic chromium and manganese.

Important gains also were registered in the field of nonmetallics during the year. On the basis of Bureau findings, the War Production Board made arrangements for the commercial production of flake graphite from domestic sources to overcome a shortage of the imported variety. The Bureau determined that some west coast sands could be treated and used in place of Belgian glass sand; it participated in the discovery of new sources of ceramic talc suitable for radio insulators; and conducted studies which revealed that certain volcanic rocks can provide workable substitutes for magnesite brick, a refractory material once imported from Austria and Greece.

Helium, the lightweight, noninflammable gas of which this Nation has a world monopoly, flowed in a greater volume from the Bureau's plant at Amarillo, Tex., in response to ever-increasing demands from the Army, Navy, and various Government and civilian agencies. To provide ample supplies of this gas for barrage balloons, blimps, and other uses, the production of the Amarillo plant established a new record and the Bureau began enlarging the facilities and constructing new plants.

Petroleum and natural gas engineers shouldered additional responsibilities as a direct result of the war. Laboratory research and field studies by petroleum engineers and surveys by Bureau statisticians gave war agencies detailed information regarding this Nation's ability to increase its output of aviation gasoline. The Bureau opened a new field office to stimulate crude oil production from the Appalachian fields. Other field offices marshaled their chemistry and refining experts to evolve solutions of technical problems in the field of petroleum and natural gas.

Looking to the time when our petroleum reserves may be depleted, the Bureau continued its research on the production of gasoline, fuel oil, and other byproducts from coal. New coals were tested and their suitability to liquefaction was determined. The Bureau made plans to study another process—the Fischer-Tropsch method—for pro-

VIII · *Report of the Secretary of the Interior*

ducing motor fuels from coal. Bureau chemists analyzed more than 15,000 coal samples to aid the Army, the Navy, and other agencies in their purchases of millions of tons of coal.

Expanding its program to assist workers and management in curbing the toll of death and injuries in the coal-mining industry, the Bureau began the systematic inspection of coal mines by Federal inspectors for the first time as authorized under the Coal Mine Inspection Act of 1941. Up to June 30, 400 mines had been inspected. While the act was not a wartime measure, the inspection program became doubly important after December 7, 1941, because of the absolute need for conserving manpower and avoiding interruptions in production schedules resulting from accidents and disasters.

The Bureau also was designated to administer the Federal Explosives Act, and as part of a Nation-wide move to protect production, supply, storage, and transportation facilities, the Bureau was made responsible for helping to protect coal mines, metal mines, quarries, mills, smelters, and allied mineral facilities from sabotage and subversive action. More than 100,000 persons received training in first aid, accident prevention, and mine rescue work, bringing the total instructed in first aid alone to more than 1,500,000.

Time and again the Bureau responded to requests from war agencies for assistance in particular problems. Demolition studies were conducted in cooperation with the Army; confidential research regarding the health factors in military equipment was undertaken for the Army and Navy; high-speed explosion diaphragms were developed for war industries and studies were made of the explosion and inflammability characteristics of chemicals used by the synthetic rubber and plastic industries; plant security examinations were conducted for the Ordnance Department of the Army; a new method of extinguishing magnesium fires in industrial plants was developed; and several experts of the Bureau acted in consultative capacities in various civilian defense activities.

The Bureau of Reclamation

An important role was played by the Bureau of Reclamation during the fiscal year in the war work of the West. The Bureau functioned as chief supplier of electric power, foodstuffs, and water—three basic essentials of national existence in war or in peace. Four decades of sound engineering work in the West made it possible for great multipurpose reclamation projects to supply these three basic needs in larger and more important quantities for hundreds of cities, thousands of war factories, and millions of war workers.

Of 73 reclamation projects in operation, under construction or authorized, 45 were producing power and supplying water for irri-

gation, municipalities, and war industries. Twenty were under construction.

Brought to completion were 5 of the 15 storage dams under construction. Three of them—Grand Coulee, Friant, and Marshall Ford—rank among the five largest concrete dams in the world.

Outstanding was the Bureau's contribution of hydroelectric power—the potent energy that turns the machines that turn out the guns. In both the Pacific Northwest and the Southwest, Reclamation's giant power plants were the bulwark behind industries already working at top speed or mushrooming into existence for the production of war material. Energy poured out of these reclamation plants and others in 11 States for manufacturing and mining; for copper, steel, aluminum, magnesium; for bombs, planes, and ships.

Generative capacity was increased tremendously during the year, due chiefly to the installation of several huge hydro generators—bigger than any others in the world—in the Grand Coulee Dam power plant, Washington. In the Boulder Dam power plant, Arizona-Nevada, also, another big generator was installed and placed in operation—to make by far the most powerful array of dynamos ever assembled and synchronized into action. Being hurried to completion as the year closed were more generators at Boulder, Grand Coulee, and Parker (Arizona-California) Dams, due to start operating within 6 months.

Water, a primary essential in war, was provided during the year for municipal areas of 2,500,000 population. Extensive industrial and military concentrations were located in the areas. The Rio Grande project in New Mexico, Tex., the Contra Costa Canal on the Central Valley project in California, and the Provo River project in Utah were among these projects.

Aside from the generation of power, and the release of water itself for domestic and industrial uses, the regional production of food, forage, and fiber on the reclamation projects in the West supplied urgent needs. This production reduced the burden on transcontinental railroads and highways for the movement of men and equipment. It meant speedy delivery of supplies, and the saving of freight cars, of steel for rails and equipment, of fuel for engines, and of gas, oil, and rubber for trucks.

Stored water irrigated more than 3,000,000 acres of productive land. Irrigation district officials collaborated with the Bureau in an intense effort to get the most from high-production reclamation farms. The gross value of the 1941 crops on land served with reclamation water was \$159,885,998, a 35 percent increase over the \$117,788,677 of 1940. These values do not include the livestock fattened on reclamation projects, nor dairy products such as milk, butter and cheese, and poultry

and eggs—which would increase the totals perhaps more than 25 per cent additional.

The storage capacity of the 81 reclamation reservoirs in the West at the end of the fiscal year was 61,610,283 acre-feet, a gain of 13,845,680 acre-feet—29 percent over the July 1, 1941, capacity. Active storage, available for power, irrigation and domestic and industrial uses, was 47½ million acre-feet compared with 41½ million last year, a huge increase graphically illustrating the foresightedness of the Bureau in undertaking construction long in advance of emergency need.

Set in motion also during the year was a program for lessening the shock of post-war dislocation. Under investigation were 209 river basins and potential irrigation or multiple-purpose projects in 17 Western States, which would produce an inventory of water resources and point the way to their economical and effective use in a region where water is the most precious natural resource and the surest basis for economic expansion.

From studies that have been completed or are well advanced, the Bureau is selecting for a reservoir of public works a minimum of 50 feasible post-war projects. Demobilized soldiers, sailors, and marines will require employment in useful occupations. Industrial workers released from war factories will want work close to their original homes. This shelf of projects and the remaining construction on more than 20 projects where work has been retarded by war conditions, including the Columbia Basin Reclamation project in the State of Washington, will provide some of that work. On completion the projects will offer settlement opportunities on irrigated farms where families can become self-sustaining.

The Bonneville Power Administration

In the Pacific Northwest, the Bonneville Power Administration delivered almost 2,000,000,000 kilowatt-hours of Columbia River energy to war industries in the area. Shipyards, naval stations, aluminum, magnesium, ferro-alloys, ferro-silicon, and war chemical plants and allied industries were energized by public power produced by the Bonneville-Grand Coulee system. Indeed, these vital war establishments came into being only because the Bonneville Power Administration made Columbia River energy available.

Thus one of your administration's great peacetime projects became one of the most productive facilities possessed by this country for war. It is no idle assertion to say that the great war output from the Northwest—planes, metals, chemicals, ships—would have been virtually impossible had it not been for this progressive power system. Bonneville and Grand Coulee dams, with their integrated network of transmission facilities controlled by the Bonneville Power Admin-

istration constitute one of the greatest power sources in this Nation. That source has been fully harnessed for war.

Not only is this Federal hydroelectric development on the Columbia River paying for itself as a war facility, it is, I am happy to report, beginning to pay back substantial amounts to the United States Treasury. Power revenues of the system during the 1942 fiscal year were three times the 1941 figures. On the basis of executed and assured contracts, the Administration's revenues in the 1943 fiscal period will more than double the 1942 income. This power system, you will recall, was once described as a "white elephant" by those who opposed its building on the ground that it would have no field for the disposition of the power to be generated.

Another record established by the Bonneville Power Administration is worthy of mention. Although the great war metals and production plants established in the Northwest were completely new, and thus required new construction of transmission facilities, power was waiting at the plant sites in every case by the time that the plants were ready to use it. In no case was there any delay in Northwest war production because of failure to have Columbia River power at the locations on time. The import of this accomplishment becomes clear when one considers the heavy amounts of power involved and the difficulties attendant upon heavy construction during a time of war, as well as the lack of necessary power in many important industrial areas in other parts of the country.

During World War I the resources of the Pacific Northwest were not developed as they are now. At that time, the hydroelectric projects on the Columbia existed only in the dreams of far-sighted men, and the Nation could not count on this area for the enormous war metals and weapon production that is now flowing from the Northwest. Now the call upon the Bonneville Power Administration for electric energy for war and for distribution by public agencies has proved both the wisdom of the construction of the Columbia River dams and of the basic planning of the Bonneville transmission system.

The Division of Power

Established April 18, 1941, to coordinate the Department's power-production activities, the Division of Power worked toward that end with emphasis on power for war throughout its first complete fiscal year.

Our principal objectives were the development of additional power for war; the maximum use of available power in war production; the construction of new power facilities which require a minimum of critical material and which can be completed in time for war use; the location of war plants on sites where low costs to war industries

XII · *Report of the Secretary of the Interior*

and development of a balanced economy in the region of the plant would result, and where operations might continue after the war.

The Division has worked toward pooling the Department's power resources in ways that would result in the greatest efficiency and in the availability of maximum amounts of power in the various areas. It has insisted that power from Departmental projects be sold for war uses at the lowest possible rates in order to hold the cost of war essentials produced by the power at the lowest feasible level.

Arrangements to supply approximately 200,000 kilowatts to the big magnesium plant near Las Vegas, Nev. were worked out with the Bureau of Reclamation, the allottees of Boulder power and Defense Plant Corporation. This transaction constitutes one of the largest single sales of power ever made to a consumer.

Hetch-Hetchy power was turned to war use. In November 1941, a 17-year-old dispute regarding the disposition of this power in accordance with the terms of the Raker Act culminated in the rejection by the city and county of San Francisco of a charter amendment which precluded the civil use of the power which had been under consideration. Largely through the efforts of the Division, the Federal Government built an aluminum reduction plant near Modesto, and Hetch-Hetchy power was sold to the plant.

These are but highlights of the Division's activities. It also worked with the War Production Board for the installation of additional generators on Columbia River projects, assuring their maximum war-usefulness. It has kept war agencies informed about the quantity and location of available departmental power. It has acted generally as a liaison office between various agencies of the Department and the war agencies, and has operated within the Department as a clearing house for the increasing body of problems incident to departmental power activities.

During the fiscal year the installed capacity of power projects under the jurisdiction of the Department was increased by more than 500,000 kilowatts, bringing the total to almost 1,800,000 kilowatts. This represented an increase of 41 percent in power installations.

The Geological Survey

The work of the Geological Survey for the year was determined largely by a redistribution of essential metals among nations which was made necessary by the war. When Germany invaded Norway in April 1940 the Anglo-Saxon peoples controlled approximately 75 percent of the world's metal supply. Germany controlled a small percentage, and Japan a negligible portion.

Within a few months, Germany acquired the iron of Norway, the coal and iron of France and Belgium, the copper and aluminum-bearing

ing bauxite of Southeastern Europe, the metals of the Balkans and, by the force of international circumstances, could draw upon the product of Sweden's rich iron mines. On the other hand, the amount of metal available to us in other countries was reduced by Axis raids on our shipping, the disruption of war, the lack of transportation, and other concomitant factors.

The Geological Survey thus entered the fiscal year with our sources of metals for war greatly reduced, and those of our potential enemies correspondingly increased. Then Japan went into the war and swiftly captured the world supply of tin in the Dutch East Indies.

Inevitably a major activity of the Survey involved a diligent search for more minerals for war in the areas still accessible to us. Such a program, launched the previous year, was greatly enlarged and carried on throughout the United States and in Alaska as well as in Cuba, Mexico, and other American Republics, in cooperation, in many instances, with the Bureau of Mines.

This search, which is still being vigorously pursued, has a twofold purpose: The first, to make available more of the high-grade ores, customarily utilized in this country, by reevaluating old deposits and finding new ones; the second, to amass geological data which have to be available before we can recover low-grade ores, previously unused, but which must be used if we are to turn out enough munitions and implements of war to insure victory.

It is too early to measure the success of so comprehensive a program, but some encouraging results can be reported. Basic data essential to the planning of an iron and steel industry in the West have been provided. Large scale development of manganese deposits in Arkansas has been undertaken. Tungsten was discovered in an Idaho mine which, by the end of the fiscal year, was the Nation's largest single tungsten producer. Largely on the strength of previous findings, production of chromite began this year from the abundant deposits in the Stillwater District of Montana. A new mill there is turning out 150 to 175 tons of chemical grade chromite concentrates daily.

Elsewhere profitable work has been carried on with respect to these and other strategic metals—bauxite, high-grade aluminum clays and alunite (potential sources of aluminum), magnesite, quicksilver, beryllium, tantalum, lithium, and others in the United States and Alaska; manganese, nickel, chromite, tungsten, antimony, quicksilver, chrome, tin, and vanadium in Cuba, Mexico, and other American Republics.

Discovering and revaluating deposits of high-grade minerals has led to an indispensable contribution to victory. These basic metals and alloys are forged into munitions and implements of war, or into machines for war manufacture. But the ultimate worth of complete

XIV · Report of the Secretary of the Interior

data on deposits of low-grade ores is not so definite. Many of them have been evaluated qualitatively and quantitatively, but their effectiveness against the enemy depends upon how quickly and how extensively they can be put to use.

There are some encouraging signs. Plans now well underway for war manufacture from some of the low-grade iron deposits in the West appear certain to materialize. But general use had not been assured at the end of the fiscal year.

The Geological Survey also placed a war emphasis on its numerous fields of work which are unrelated to the search for minerals.

Data on water resources, regularly gathered and published by the Survey, are doubly valuable in time of war. Rapid expansion of the national war plant, requiring large water supplies for processing, and to accommodate concentration of troops and of war plant workers, requires knowledge of the quantity and quality of water available at these points of development. Reports and consulting services have been furnished on surface and ground-water supplies for war purposes at about 1,700 places in the United States and in certain islands of strategic importance, as requested by the War and Navy Departments, the War Production Board, and other war agencies.

These reports have related to the water supplies for Army cantonments, naval stations, munitions plants, largely increased local concentrations of population producing war supplies, and for other war activities. Surveys were made for the Navy Department of emergency supplies from wells in case of attack, and summaries of water conditions, on the surface and underground, throughout the United States were prepared each month for the use of the agencies in charge of water-supply and power activities related to the war.

The war program was furthered also by the Geological Survey's conservation work—its surveys and investigations of water and mineral sources of the public domain, and its supervision of certain phases of mineral- and power-production on these lands. Production of coal, petroleum, natural gas, natural gasoline, butane, potassium salts, and phosphate rock from public lands was substantially greater in 1942 than in 1941. Additional lands were coming into production, and an unusual amount of prospecting was underway. Production of lead, zinc, and coal also increased on Indian lands, and there, too, extensive prospecting was in progress.

Numerous mechanical devices constructed during the year have greatly accelerated the production of maps for the Air Corps. The most important are the Lewis rectoblique plotter, the Sketchmaster, and the Lucidagraph. A double photoalidade and a stereoblique plotter are now being developed. By means of such instruments, aerial photographs taken at an angle of approximately 30° below the

horizon may be converted into the kind of maps required for the navigation of air forces over previously unmapped or inadequately mapped areas.

The Office of Solid Fuels Coordinator for War

In a letter dated November 5, 1941, and addressed to me, you called attention to the need for "efficient and carefully coordinated development, production, distribution, utilization, transportation, and handling of solid fuels" to assure their availability when and where needed for military and civilian use, and requested me, as Secretary of the Interior, to serve as Solid Fuels Coordinator to help achieve these objectives.

The Office of Solid Fuels Coordinator was established and quickly began functioning, using, for the most part, the staffs, facilities, and data of the Bituminous Coal Division and the Bureau of Mines, thus effecting economy in time and funds, instead of building a large new organization.

Immediate steps were taken to organize the industries dealing with the coal supply on a war basis. Representatives of the coal mining industries, coal transporters, distributors, dealers, and mine labor met with me on December 18, 1941, and the groundwork for organizing the industries was laid. Cooperation continues through a council of 18 members, representing the industries concerned, mine labor, and the public.

Estimates made early in 1942 indicated that the Nation would require 550,000,000 to 570,000,000 tons of bituminous coal, approximately 60,000,000 tons of anthracite, and about 70,000,000 tons of coke during the calendar year of 1942—amounts far exceeding normal production. Later experience indicates that these estimates are in line with actual requirements.

The Coordinator, in cooperation with industry and other Government agencies, is taking various steps in an effort to forestall any emergency as to the coal supply because of wartime changes and deficiencies in manpower, equipment, and transportation.

Although there are many difficulties yet to be surmounted before the Nation can be assured of adequate wartime fuel protection, it appeared as of June 30, 1942, that it would be possible to provide adequate coal of some usable type to keep homes warm and industry operating throughout the winter, provided that dealers and consumers would order their coal sufficiently early to enable mines and carriers to make full and continuous use of their manpower and facilities throughout the warm season.

To bring about public cooperation, a "Buy Coal Now" campaign was launched in the spring of 1942 in cooperation with other Govern-

ment agencies and with industry. In general, public cooperation was excellent, although in many cases, consumers failed to make full use of their opportunities to obtain bituminous coal for storage. Restrictions in the production of anthracite, however, threaten to prevent the storage of the full amount of hard coal that consumers are ordering.

However, as of June 30, 1942, coal in general was being produced and transported at a rate much higher than was demanded by normal seasonal requirements, and a great deal of it was going into dealers' and consumers' storage as wartime fuel insurance.

The Bituminous Coal Division

It is anticipated that the war will necessitate the greatest production of bituminous coal in history. The stabilization of coal markets under the Bituminous Coal Act of 1937, as administered by the Bituminous Coal Division, is one of the principal factors which is enabling the coal mining industry to meet its responsibility for supplying the Nation with the principal source of the energy needed to forge the implements of war.

For 14 months prior to Pearl Harbor the industry enjoyed stable markets and fair trade practices by virtue of the minimum prices and marketing rules and regulations promulgated under the act. This gave it the incentive and the opportunity to improve its capital strength and better to prepare itself for the challenging task of meeting wartime fuel requirements.

It is essential that the stabilization of coal markets by minimum price regulations be continued vigorously as a measure of immediate importance to fighting the war. It will also aid the prevention of post-war chaos in this basic industry, such as followed World War I.

At the present time, the stabilizing effect of minimum price regulation makes it possible for the industry to plan the orderly production and distribution of coal in such a way as to obtain the maximum use and efficiency of the limited manpower and equipment available for producing and transporting coal in time of war. It prevents the recurrence of pressure buying, particularly by large industrial consumers; curbs cross-hauling and dumping, and constitutes a bulwark against other practices and conditions peculiar to the coal mining industry which would promote waste of the means of producing, transporting, and distributing this vital war fuel.

The demoralization of the coal mining industry which followed World War I, which involved destructive price cutting and undesirable trade practices on a Nation-wide scale, caused tremendous financial losses. It precipitated violent disturbances between mine owners and their employees, and seriously weakened the industry's capital structure. These conditions had an undesirable effect upon the general

economy of the Nation in addition to perpetuating the more acute situation in the coal mining regions. They persisted even in times of general Nation-wide prosperity, and continued until minimum prices and marketing rules and regulations were made effective on October 1, 1940. The continued stabilization of this industry under the Guffey Act will make a large contribution toward speeding general post-war stabilization.

The Bituminous Coal Division is making other great contributions to fighting the war. It is serving as a central source of coal statistics, and in many instances is providing technical advice, for other Government agencies dealing with wartime fuel problems, including the Coordinator of Solid Fuels, the OPA, the War Department and others.

The establishment by the OPA of anti-inflationary ceilings on coal prices was a task which obviously might have puzzled experts for many months. It was rendered relatively simple because the Division had classified all soft coals and was able immediately to furnish data on production costs and maximum price application and to give other technical assistance. The Division is continuing to give substantial aid to OPA in handling compliance matters and in making adjustments to the schedules.

The National Park Service

As trustee of much that is great in America, the National Park Service has endeavored to harmonize its activities with the war program while holding intact the things entrusted to it.

The stewardship of the Service extends over areas of outstanding beauty, scientific interest, historical significance, and, more important, the uniquely American concept under which the national parks are preserved inviolate for the present and future benefit of all of our people.

Lumbering, mining, grazing, and other exploitation of national park areas have been urged as a necessity of war. The Service has tried to measure the degree in which necessity justifies destruction of irreplaceable values and has acted accordingly. With due regard for its conservation responsibilities the Park Service has nevertheless rendered valuable service within the war program.

One hundred twenty-five permits have been issued to the War and Navy Departments and other war agencies to make use of National Park Service lands, buildings, and facilities. Salt for use in magnesium production has been made available from National Park property. Steps were taken to establish fire-lookout and air-raid warning towers immediately after war was declared, and much besides has been done in furtherance of immediate war aims.

Equally vital, if not so spectacular, the Service has helped to sustain national morale in the exercise of its usual functions. Special reduced rates for men in uniform were continued in effect in federal park areas, and an estimated 650,000 of them visited these inspiring monuments to America's present and past greatness during the year. Several thousand British sailors found rest and a change of scene while occupying group camping facilities in recreational demonstration areas and vacated CCC camps. Service technicians helped to plan and to direct the construction of 33 army rest camps in 23 States and the District of Columbia—places in which service men on leave might find rest and relief from training.

Instead of increasing as usual, travel to the National Parks decreased 30 percent this year because of limited motoring to conserve gasoline and rubber. The decline was greatest at Yellowstone, Glacier, and Crater Lake, and least at Sequoia, Yosemite, and Carlsbad Caverns which are closer to metropolitan centers.

While many activities of the Service were curtailed or deferred, historic areas were kept open and visiting time was lengthened.

The General Land Office

The General Land Office responded to the national war needs during the fiscal year by withdrawals of public lands for military and other war uses, by seeking new outlets for various resources on the public domain, by making public lands and their resources available for use in war industries, by facilitating the search for strategic metals, and by other activities, including many in close cooperation with other agencies.

More than 7,000,000 acres of public lands were withdrawn for military purposes, including areas for aerial bombing ranges, antiaircraft fields, combat training lands, artillery practice grounds, air navigation sites, flying schools, ammunition storage, and ordnance depots. This year's withdrawals bring the total area of public lands withdrawn for military use to 13,000,000 acres.

In the development of strategic minerals the General Land Office cooperated with the Defense Plant Corporation, Metal Reserves Co., the Reconstruction Finance Corporation, and other agencies. Opening reserved mineral deposits to exploitation has made available large quantities of tungsten, manganese, and other minerals. The potash reserves in New Mexico and California, operating under lease, now provide large supplies of potassium at less than one-sixth of the price paid for potassium during the first World War.

Studies are under way to determine possible new uses for resources on the public domain. New values are being found in minerals, natural vegetation, and other resources which heretofore were con-

sidered of little importance or which were not known to exist. Commercial quantities of strategic minerals may be developed from previously unused deposits, and such materials as fiber, rubber, turpentine, and resin, may be produced from desert shrubs.

Authorized by recent legislation to lease or sell lands in the public domain for use in connection with specified war manufacture, I have issued regulations under which the Commissioner of the General Land Office will negotiate transactions providing land to be used for its yield of timber, sand, gravel, and stone; and as factory sites, housing development sites for war workers, and as expansion areas for plants bordering the public domain.

It is possible that yucca, growing on public lands, may be used as a substitute for fibers that can no longer be obtained from the usual sources. Information also was gathered on the possibility of helping to relieve the rubber shortage by furnishing lands for the raising of guayule, and by making rabbit brush on public lands available.

Fire prevention and suppression activities have been greatly increased. Through the work of the Oregon Forest Defense Council, plans and policies were adopted which will greatly increase the effectiveness of fire suppression agencies in coping with forest fire conditions—even the abnormal conditions that exist in wartime. Work also continued in the suppression of outcrop coal fires which were threatening destruction of a very large amount of the Nation's coal resources in the vicinity of Little Thunder Basin, Wyo.

The Office of Land Utilization

The proper management of land, important in peacetime, becomes even more vital in war. This Department has jurisdiction over 625,000,000 acres of public land in the United States and Alaska. In order that this great domain might make its maximum contribution to the war, the Office of Land Utilization has directed close coordination during the year of all land management programs in the Department. An immediate result has been an increase in timber production from Departmental lands and an improvement in western range lands which has fitted them for greater sustained production of beef, leather, wool, and other livestock products. An increased output from the land of minerals, timber, food, and raw materials was made possible without compromising sound conservation practices.

Developmental programs were curtailed in accordance with the needs of war for money. At the time of Pearl Harbor, a \$2,178,000 soil- and moisture-conservation program was under way. This activity promptly was restricted to the projects offering the quickest return in increased production of necessary materials. The balance of the projects were postponed.

xx · Report of the Secretary of the Interior

Burdens of protection also were assumed by the Office of Land Utilization. Working closely with the Office of Civilian Defense, the OLU took over the Facility Security Program which involved the establishment of a nonmilitary front against subversive action, forest and range fire hazards, and other forms of sabotage aimed against war production.

The Grazing Service

In addition to continuing its program of a wise use and development of Federal grazing lands during the fiscal year, the Grazing Service facilitated military use of the range.

Proving grounds were provided for thousands of bombers and tanks, and nearly 3,500,000 acres of Federal grazing districts were converted into training areas, bringing the area withdrawn for military use in 2 years to 8,500,000 acres. Despite these withdrawals, livestock production was kept at a high level.

Range improvement was confined, with few exceptions, to water development, construction of trails and feeder roads, revegetation, maintenance, and other activities requiring little or no critical materials.

Range reseeding experience furnished a valuable guide to future methods. A total of 199,670 acres was reseeded in 1942, compared with 66,000 acres in 1941. Nineteen million acres of range lands were surveyed and a recheck survey was accomplished on 10,000,000 acres during the year.

The Grazing Service became the first bureau of this Department to be decentralized from Washington. Headquarters were transferred in August 1941 from Washington, D. C., to Salt Lake City, Utah, the hub of the Federal range territory.

The Fish and Wildlife Service

The prudent use of our wildlife resources encouraged in the past by the Fish and Wildlife Service paid dividends this year as the Nation sought maximum returns from its investment in conservation. The Fish and Wildlife Service has done much to produce more abundantly for war from the resources that it administers, but it has enforced the principle of increased production to the extent consistent with conservation.

Nearly all of the war agencies have urged the delivery of more products derived from wildlife—more fish for the armed forces at home and abroad, for our outposts and for our allies; more vitamins from fish, more fish liver oils, more fur and fiber and food for war. We have given sympathetic assistance, but we have always looked

first to new sources to tap, to fuller use of resources at hand, and for means of spreading customary production further.

To increase the home supply of fish, we have advocated production in farm ponds that now flourish in the South. To augment the commercial catch, we have urged the industry to land species and sizes which previously were caught and discarded as unpopular, though suitable for table use. We have provided data on seafood production in the various theaters of war so that our expeditionary forces might find a local supply, thus diminishing their demand upon American resources and freeing shipping space for arms and munitions.

These are a few typical means by which we have tried to increase present fish production without impoverishing the future.

A program to use less material needed for war has paralleled our program for producing more food. With some success we have experimented with canning plates requiring reduced amounts of tin, and with noncanning methods of fish preservation. We have assisted in the release of fishing vessels for war use, and have facilitated the use of net-manufacturing machines in making camouflage nets.

We have been active in the field of predator control to conserve food and raw materials. In a single instance organized control reduced sheep losses from 7 percent to less than 2 percent. This is a considerable contribution when it is considered that the Army estimates a need for 100 pounds of scoured wool for each soldier during his first year of service, and taking into account also that 15,000,000 shearling pelts are needed to line aviators' coats.

In this report you will find accounts of the Fish and Wildlife Service rendering many war services other than those which its title indicates that it might perform. Among these are services related to the control of disease, often among concentrations of troops; the prevention of stream pollution, which was increasing because of hurriedly expanded mining and manufacturing operations, and to services related to food-storage in England.

All of these activities have been better correlated and their results have extended further because of the relationship between the Fish and Wildlife Service and the Office of Fishery Coordination. This Office, operating under my jurisdiction, is charged with mobilizing for war all of the industries concerned with harvesting, preserving, and distributing fish and fish products. The key personnel of the Service's Division of Fishery Industries and that of the Coordinator's office is identical.

The Office of Indian Affairs

The Office of Indian Affairs has dealt with numerous and important problems of war. After the attack on Pearl Harbor, all of the Aleutian Islanders west of Dutch Harbor were evacuated according to plan, and the removal of these people from their homes raised many problems for

XX · *Report of the Secretary of the Interior*

Burdens of protection also were assumed by the Office of Land Utilization. Working closely with the Office of Civilian Defense, the OLU took over the Facility Security Program which involved the establishment of a nonmilitary front against subversive action, forest and range fire hazards, and other forms of sabotage aimed against war production.

The Grazing Service

In addition to continuing its program of a wise use and development of Federal grazing lands during the fiscal year, the Grazing Service facilitated military use of the range.

Proving grounds were provided for thousands of bombers and tanks, and nearly 3,500,000 acres of Federal grazing districts were converted into training areas, bringing the area withdrawn for military use in 2 years to 8,500,000 acres. All of these activities have been better correlated and their results have extended further because of the relationship between the Fish and Wildlife Service and the Office of Fishery Coordination. This Office, operating under my jurisdiction, is charged with mobilizing for war all of the industries concerned with harvesting, preserving, and distributing fish and fish products. The key personnel of the Service's Division of Fishery Industries and that of the Coordinator's office is identical.

The Office of Indian Affairs

The Office of Indian Affairs has dealt with numerous and important problems of war. After the attack on Pearl Harbor, all of the Aleutian Islanders west of Dutch Harbor were evacuated according to plan, and the removal of these people from their homes raised many problems for

this Office. It helped to relocate them, to provide relief and medical care, and to plan their future self-support.

It was also active from the beginning in the relocation of the West Coast Japanese, and is administering the largest of all evacuee centers. At the request of the War Relocation Authority, the Office of Indian Affairs assigned personnel and equipment to establish centers for large numbers of Japanese and their American-born families. Blocks of Indian land also have been requisitioned for military use, and the removal of Indian families, which resulted in some instances, constituted a direct war service for the Office.

Charged with grave responsibilities toward the Indians of the United States and the natives of Alaska, we have seen the war come very close to both—to the very doorsteps of some among the latter group in the Aleutian Islands. In both the United States and Alaska the response of these minorities to the challenge of war has been excellent.

The Alaskan natives have already defended their homes and given their lives on their own soil in this war for freedom. In the United States, Indian enlistment in the armed forces increased rapidly after war was declared, and on June 1, 1942, there were 7,500 of them in the service. Their most distinguished soldier, thus far, has been the late General Tinker, an Osage, lost in the battle of Midway on a daring air mission bravely self-undertaken.

At least 6,500 Indians who received vocational training under the CCC program are now in the service, and others are applying the skills that they learned in shipyards, airplane factories, and munitions plants.

The natives of Alaska are serving there in the United States forces. The skill of these men and their intimate knowledge of the country are of extraordinary value.

Evidence of the Indians' will to victory has come from even the remotest reservation. On several occasions groups of Indians have arrived at agency headquarters, each man with his gun, ready to proceed immediately to the scene of the fighting. The Crow Tribe in Montana offered the Government all of its resources and manpower. Indians in the United States and Alaskan natives alike have been generous buyers of war bonds.

During the fiscal year much has happened to strengthen our policy toward the Indians. War conditions are hastening the maturity of tribal self-government; the Indians are continuing the practice, begun several years ago, of investing tribal monies in the land; the courts have tended to sustain the tribes' rights in certain lands against conflicting claims and despite the fact of forcible removal, and to uphold their right to fish in accustomed places without payment of State license fees.

The Inter-American Indian Institute was formally created March 25, 1942, in Mexico City. This organization is the official agency for

the development of collaboration among the American nations on matters affecting the more than 30,000,000 Indians who live in the Western Hemisphere, and it has received support and encouragement from the Service.

The Division of Territories and Island Possessions

Although all of the American people have felt the effect of war, the people of our territories and island possessions have literally been living in the front lines. Two of the territories, Alaska and Hawaii, have been under enemy attack. Puerto Rico and the Virgin Islands have been under the heavy hand of maritime siege.

The response of the citizens in our territories to the trials and perils of war has been magnificent. In some instances they have been driven from their homes; they have had to accept sharp restraints; they have had to make profound readjustments in their lives and affairs. But the nearer the proximity of the enemy, the further in his blows the greater has been their determination to crush him once and for all, regardless of the cost to themselves.

The attack upon Pearl Harbor made Hawaii the center of an active combat zone. A well-organized civilian defense program took its place alongside of the military operations. Funds were provided for civil protection, health, sanitation, hospitalization and other civilian defense necessities, and a representative of my office proceeded to Honolulu to aid, temporarily, in the administration of the program. With the full-fledged cooperation of civil and military authorities a comprehensive program was undertaken to assure adequate protection for the population in the event of further attack.

The report of the Governor supplies the story in full detail. The willingness of all elements—citizens, plantation operators, factory owners, transportation employees, contractors, builders and utility workers—contributed to the prompt execution of a protection program that should serve as a model for Americans under fire.

Subsequent developments, as the life of the islands was abruptly switched from peace to combat, have had a disrupting effect. The change from normal, revenue-producing shipping to the movement of war supplies has adversely affected Territorial finances. Necessary combat zone restrictions on the daily life have caused complications. There is a shortage of housing, and the labor problem is far from being solved. No one has any doubts, however, as to the ultimate fortunate outcome of these matters.

Alaska also found itself in the front line. Close to the top of the world, where airline distances telescope amazingly, the Alaskans were keenly aware of their nearness to the enemy. They were awake, also, to the assiduity with which the Japanese had studied and

XXIV - *Report of the Secretary of the Interior*

charted Alaskan waters, explored the coastline and penetrated the Aleutian Islands. It was no surprise to them, therefore, when bombs fell on Dutch Harbor. They had expected them earlier.

In the evacuation of native populations from the various islands the Office of Indian Affairs played a large role. Several hundred natives and whites were forced to leave their homes and ancestral hunting areas and were moved to the mainland. Evacuation camps were established and the first American refugees were made completely comfortable in new locations. There is reason for great pride in the way in which this job was handled.

Severe problems were created for Alaska by the influx of large numbers of troops and the establishment of long-overdue military bases. In great numbers construction workers were suddenly dumped upon undeveloped areas, causing many difficulties in social adaptation and adjustment. Boom times transcending the days of the gold rush were created. Serious difficulties of supply had to be coped with.

Alaskans were prompt to volunteer for military service. Indians and Eskimos appeared with rifle in hand. The knowledge of the Alaskans of their own territory was put to excellent use. In countless other ways Alaskans lived up to their reputation as alert, enterprising Americans, able to cope with situations which might be dismaying to those of less tough moral fibre.

In Puerto Rico and the Virgin Islands, in the vital Panama Canal defense zone, the people and their governing officials realized the immensity of the war and the problems of our involvement more quickly than those facts were grasped on the continent.

In the Virgin Islands, our Easternmost outpost, the program for both civilian and military preparedness was especially intense. When war came, this was well advanced. James M. Landis, Director of the Office of Civilian Defense, later recognized this when he said, "We must put into practice in the Nation much of what these islands . . . have already done."

Such strength as we have shown in the off-shore areas has gained valuable time for us, especially in the instance of possible eventual enemy occupation. Much of our strength lay in the loyalty of the inhabitants, but much also was the result of your administration's farsightedness. Pre-war controls over shipping, trade in war-essential commodities and other activities strengthened our position.

The problem of supply for Puerto Rico continues to be acute. It is, without question, the most severe single problem that we face in any of the territories. Every effort is being made to obtain greater tonnage for the island, and in this all agencies of the Federal and Territorial Governments are cooperating to the fullest. The complete solution will come only when success in arms will release greater numbers of vessels for assignment to this service.

The Office of the Petroleum Coordinator for War

While the Office of the Petroleum Coordinator for War (now the Petroleum Administration for War) is not a part of the formal organization of the Department of the Interior, I wish nevertheless to mention this activity briefly in this letter. What the Nation would have done to handle its oil problem under actual war conditions had it not been for the earlier work of the Office of Petroleum Coordinator, I cannot guess. The story of the successive problems created by the disruption of normal petroleum transportation and supply pattern is too fresh in memory to bear repetition here. Although the warnings we issued in the summer of 1941 were largely ignored, and the restrictions which were imposed met with derision and a flood of misrepresentation, the correctness of our actions came to be generally recognized. Now, with war demands for specialized petroleum products increasing daily, it is clear that efforts to provide the aid necessary for war were started none too early.

In this connection, I want again to emphasize that the remarkable results that have been brought about would have been impossible without the wholehearted willingness of the oil industry to work in full partnership and understanding with the Federal Government. Too much credit cannot be given to the members of that industry. Traditional competitive practices have been laid aside, and many individual companies have willingly accepted severe financial loss to make an integrated handling of the oil problem possible. There is no such thing as "business as usual" today in the oil industry. Normal patterns have been junked for the duration, and the handling of petroleum from the well to the delivery of the finished product is replete with innovation. As one member of the industry puts it: "The difficult we do at once; the impossible takes a little longer."

Three principal tasks were faced by the OPC. They were to provide an adequate supply of petroleum and specialized products for our armed forces; for the United Nations, and for our own civilian front. It has been only by the use of considerable ingenuity that we have succeeded as well as we have. With the assistance of the industry, we will continue to dispose of the difficult and to perform the impossible.

Conclusion

Although this letter is optimistic in tone, the facts speak for themselves. The series of disasters inflicted upon the United Nations by their enemies depressed men's spirits everywhere, and a recounting of accomplishments such as this may seem somewhat trivial and academic when judged against the somber backdrop of the world today. And yet, as I analyze what this one Department of the Federal Government

XXVI · *Report of the Secretary of the Interior*

has accomplished in the face of handicaps, there is ample cause for grim cheerfulness.

We can appraise our progress honestly and find that we have moved forward. Under the general tendency to magnify our defeats and belittle our accomplishments because they seem small against big events, we might not regard what we have done as significant. We have had failures, many of them. We have had lapses of imagination, and of concept, and failures of execution. But on the asset side, we have accomplished some truly worth-while things. So far as this Department is concerned, we intend to proceed with our work; to persist in what we think is the right course, and, with the greatest energy possible, proceed with the sensible development of conservation and supply programs that, in the end, will win the war.

Sincerely yours,

Harold L. Ickes

Secretary of the Interior.

(Note.—*Specific details relating to individual projects and to power production normally contained in this report have been deleted at the request of the Office of War Information and the War Department*)

Bureau of Reclamation

JOHN C. PAGE, Commissioner

BASED on the sound theory that soldiers and civilians fight best when properly fed, and victory is surer, swifter, Reclamation operations during the 1942 fiscal year were aimed at providing foodstuffs for men behind the guns and machines as well as hydroelectric power for the guns and machines themselves.

For a short conflict or a long pull—a war of attrition—this dual objective symbolizes the straight thinking of a democracy at bay.

The year's results from Reclamation activities in 16 Western States are impressive. Four decades of sound engineering work enabled the Bureau to assume a vital role in the Nation's war machine. Outstanding was its contribution of hydro power—potent energy that turns the machines that turn out the guns.

In the Pacific Northwest and Southwest giant Reclamation plants were the bulwark behind industries working at war tempo or mushrooming into production of war material. Power poured out of these plants and others for mining and manufacturing; for copper, steel, aluminum, magnesium; for bombs, planes, and ships.

Simultaneously, reservoirs on Reclamation projects furnished water to cities and their industry, to military establishments, their training centers, their airfields.

Stored water also irrigated 3,500,000 acres of productive land. Food, forage, and fiber were produced on the strategically located 45 irrigation projects in operation in the West. Farmers were urged to plant and to harvest, to raise cows, beef, and poultry. Irrigation district officials collaborated with the Bureau in an effort to get the most from high-production Reclamation farms.

Expanded production of food, forage, and fiber was recognized as necessary to supply the demands of the United Nations, to meet

2 · Report of the Secretary of the Interior

domestic, civilian, and military requirements. Increasing civilian and military population and the urgency of conserving transportation emphasized the necessity of making the western half of the United States self-sufficient in food. This can be achieved only through an accelerated Reclamation program.

Geared to the over-all demands of the war, the construction of purely irrigation facilities made progress despite retardation by shortages of steel and other critical materials controlled by the War Production Board. Substitutions of noncritical material and concentration on excavation and other work enabled the Bureau to advance this work further than otherwise would have been possible.

Because of curtailed Work Projects Administration and Civilian Conservation Corps contributed labor, the water conservation and utilization program to stabilize the Great Plains and other semiarid areas was being redirected into a reserve against future contingency. Projects under construction are being advanced with all the speed possible; many others are being investigated and are being tagged for construction the moment war or postwar needs give the signal to go ahead.

Set in motion also was a still larger program for lessening the shock of postwar dislocation. Under investigation were 209 river basins and potential irrigation or multiple-purpose projects in 17 Western States. The investigations will produce an inventory of water resources and point the way to their economical and effective use in a region where water is the most precious natural resource and the basis for its economic expansion.

From studies that have been completed or are well advanced, the Bureau was selecting for a reservoir of public works, in accordance with the President's direction, a minimum of 50 feasible projects. This irrigation and multiple-purpose construction can be launched promptly at the conclusion of the war. Demobilized soldiers, sailors, and marines will require employment in useful occupations. Industrial workers released from war factories will want work close to their original homes. This shelf of projects, and the remaining construction on great undertakings like the Columbia Basin Reclamation project in the State of Washington, will provide that work.

In the Economic Front Line

As the fiscal year closed multiple-purpose irrigation projects engineered by the Bureau provided the hydroelectric power for war industry, assured a stable supply of water for essential agriculture and for cities and industry, and also represented a main source of manpower in the West—now in the economic front line. Once unpopulated and unproductive areas, former wasteland, after 40 years of sound Recla-

irrigation development were highly productive regions of farms and factories, towns and cities, all contributing their strength to the war.

The 81 reservoirs in operation on Reclamation projects had an active water storage of more than 47 million acre-feet—15,000 billion gallons—available for power generation, irrigation, and domestic and industrial needs. A 6-million-acre-foot increase in storage over last year illustrates the foresightedness of the Bureau in undertaking construction long in advance of an emergency.

Of 73 projects in operation, under construction, or authorized, 45 were producing power and supplying water for irrigation, municipalities and war industries. Twenty others were under construction. Nine were authorized but work was deferred because of the war. Of the 45 projects in operation several had important features still under construction.

More than 95 percent of the construction costs of these projects is reimbursable under the Reclamation law or other legislation. The remainder is allocated to flood control, aid to navigation, or to non-reimbursable labor costs.

Power Gain

The hydroelectric development on Reclamation projects as of June 30, 1942, was installed in 28 power plants on 17 projects in 11 States.

A tremendous power increase during the year was due chiefly to the installation of great generators in the Grand Coulee Dam power plant, Washington. In the Boulder Dam power plant, Arizona-Nevada, also, a big generator was installed and placed in operation, to make by far the most powerful array of dynamos ever assembled and synchronized into action. An addition at the Minidoka plant in Idaho and another at the Spanish Fork development on the Strawberry Valley project in Utah completed the year's installations.

But being hurried to completion as the year closed were more generators at Boulder, Grand Coulee, and Parker (Arizona-California) Dams due to start operating within 6 months.

Following the recommendation of the Bureau, the Congress appropriated funds for the completion of construction plans for a steam plant on the Central Valley project in California. The plant will firm Shasta and Keswick power and make the output more valuable. It will assure a larger net revenue to assist in repaying irrigation costs. The Congress also provided funds for the construction of a transmission system to carry power from the California project's Shasta and Keswick Dam power plants to market.

In the war program of the Department of the Interior for the development and utilization of western mineral resources, the Bureau recommended the construction of 17 new power projects in strategic-

4 · Report of the Secretary of the Interior

ally located areas of 11 States. Included in the proposal were steam plants. The remainder were hydro installations.

Aside from the generation of power, and the release of water itself for domestic and industrial uses, the regional production of food, forage, and fiber by Reclamation projects in the West supplied urgent needs. This production reduced the burden on transcontinental railroads and highways for the movement of men and equipment. It meant speedy delivery of supplies, and the saving of freight cars of steel for rails and equipment, of fuel for engines, and of gas, oil, and rubber for trucks.

Water, prime essential in war, was provided during the year for municipal areas of 2,500,000 population. Extensive industrial and military concentrations were located in the areas.

The Boulder Dam system on the Colorado River in the Southwest provided water for Los Angeles and 12 other cities of the metropolitan area of southern California. It supplied both water and power to the huge new magnesium plant in Nevada near Boulder Dam.

The Rio Grande project in New Mexico and Texas supplied water to the city of El Paso to make possible more extensive military operations. The Contra Costa canal on the Central Valley project provided water for industries in Pittsburg, Calif.

Work was rushed on the Provo River project in Utah to provide water for a large steel plant and for Salt Lake City and Provo. Important military and industrial concentrations in this Utah area, with increased population, are draining the limited water supplies for domestic and agricultural purposes.

Other Reclamation projects also were under construction to provide municipal water supplies. The Altus project in Oklahoma and the Rapid Valley project in South Dakota will give Altus and Rapid City new reserves. The increase in Army personnel and population made the added water supply essential.

Irrigation Crop Returns 35 Percent Higher

The gross value of food, forage, and fiber produced in the calendar year 1941 on land served with Reclamation water was \$159,885,998, a 35 percent increase over the \$117,788,677 of 1940. These values do not include the livestock fattened on Reclamation projects, nor dairy products such as milk, butter, and cheese, and poultry and eggs—which would increase totals perhaps more than 25 percent. Nor do they include returns from areas irrigated by the All-American canal and 5 other supplemental water projects.

TABLE 1.—Reclamation area and average crop return, calendar year 1941¹

¹ A detailed table of area and returns by individual projects is available on request from the Bureau of Reclamation, Washington, D. C.

² Area for which the Bureau is prepared to supply water.

³ Estimated irrigated area on projects with unreported crop returns is 250,000 acres, bringing the grand total of irrigated land in 1941 to approximately 3,698,000 acres.

⁴ Crop results not reported.

The cultivated area on regular and storage projects rose from 2,138,927 in 1940 to 2,178,288 in 1941, with crop values of \$80,098,196 and \$110,399,807 respectively (table 2). The cultivated Warren Act lands supplied with supplemental water increased from 1,177,103 to 1,202,172 acres with respective values of \$37,690,481 and \$49,486,191.

In acreage, hay and forage for livestock were the most important. Other products included vegetables and truck, fruits and nuts, small grains, seed, long-staple cotton, and sugar beets.

Reclamation projects in 12 States produced 1,450,321 tons of sugar beets, equivalent to a year's supply of sugar for an army of 5,000,000 soldiers.

The 1941 area of 101,219 acres in sugar beets was increased during the planting season of 1942, but labor difficulties and scarcity of factory facilities may restrict the year's production to a 25 percent increase. If labor is available and processing plants are established, production in 1943 could double the 1941 output.

The irrigable acreage for which the Bureau was prepared to supply water in 1942 was 4,915,716 acres. This figure includes more than 500,000 acres under the All-American canal.

The public land opened for homesteading was limited to 2,477 acres of the Payette division of the Boise project in Idaho. Owing to war conditions and the location of Japanese relocation centers on projects in California and Wyoming, other openings were deferred. Additional land was brought under irrigation on the Roza division of the Yakima project in Washington and on the Buffalo Rapids project in Montana.

1941 ²												

¹ Includes projects constructed by the Bureau of Reclamation and those for which supplemental water is furnished from storage works built by the Bureau.

² Estimated.

³ Does not include All-American Canal (Imperial Valley) project acreage and returns.

⁴ Increase over 1939 largely due to the inclusion of data for projects not included in 1939.

Food and Forage for War

The West depends on irrigated land for more than 70 percent of its food supplies. Surveys indicate that more than 50 percent of the areas served by non-Federal irrigation systems requires supplemental water to insure production in normal times. An assured water supply is doubly essential now to safeguard both the growing civilian and military population of the area from disastrous food shortages in the event of drought—for new land to be brought under irrigation as well as for established irrigated areas.

At the request of members of the Congress, the Bureau outlined for congressional appropriations committees a program for accelerated development of projects under construction. It was shown that by 1945, with high priorities and adequate appropriations, the Bureau could serve 1,964,225 additional acres of land. Included in this area are 1,096,260 acres now inadequately irrigated by other systems, on which food production is limited by water shortages. Included also are about 867,965 acres of new land which can be brought in cultivation.

This accelerated program covers about a fourth of the 8,000,000 acres to be added to the present irrigable acreage in the Bureau's current over-all program of projects in operation, under construction or authorized. When all projects in the over-all program are completed, the Bureau will be prepared to serve 5,115,224 acres with a full (or primary) supply and 7,116,074 acres with supplemental water. This total of 12,231,298 is nearly three times the 4,915,716 acres (table 1 and footnote) the Bureau was prepared to serve with irrigation water in 1941.

In northern project areas are vast acreages that could be devoted to the production of sugar beets. In southern project areas nearly 1,000,000 acres of public land could be devoted to the production of guayule to insure a domestic supply of natural rubber.

Guayule as a domestic source of rubber has been recognized by the Congress. The Bureau, cooperating with the Guayule Emergency Rubber Project of the Forest Service, Department of Agriculture, has made test plots available on the Gila and All-American Canal projects. Growths on these plots are encouraging, and additional land will be provided for more extensive tests during the winter of 1942-43.

If guayule proves suited to southwest areas, under irrigation, it is estimated that approximately 1,000,000 acres can be planted ultimately on the Gila project in Arizona and under the All-American and Coachella branch canals in California. Under the Central Valley project studies begun this year the opportunities for growing guayule in the Central Valley of California are being explored. It is estimated that 300,000 acres may be suited for guayule production.

8 · Report of the Secretary of the Interior

An experiment in cryptostegia rubber production is being carried on by the United States Rubber Co. on land leased from the Bureau on the Yuma project in Arizona. This work is still in an investigation stage.

At the close of the fiscal year Reclamation projects provided power and water to 4½ million persons in 15 Western States. On irrigation projects served by Reclamation systems were 1,088,504 persons, on 86,181 farms and in the 291 tributary cities and towns (table 3). The other 3½ million persons received power and domestic water.

In 40 years these projects have created taxable property values of a billion dollars and produced nearly 3 billion dollars (table 2) in crop values—nearly 4 times Reclamation construction expenditures through June 30, 1942 (table 5).

Vital Structures Guarded Against Sabotage

Guards, floodlights, steel fences, and other protective measures against sabotage were placed about vital Reclamation structures such as large dams and power plants during the year.

Begun with foresight early in the fiscal year, the program of protection on 48 projects in operation or under construction was expanded materially upon news of the Japanese attack on Pearl Harbor. On June 30 nearly 650 armed guards were patrolling their assigned beats.

On several projects troops aided in protection. The War Department has ruled that responsibility for protecting vital Reclamation structures rests upon the Bureau, however. Increase of the guard force to 800 was therefore proposed to the Bureau of the Budget for the fiscal year 1943.

Protective steps taken by the Bureau in addition to the guards were floating booms and steel nets in reservoirs to fend off boats and floating objects, prohibition of automobile parking on or near dams, and a close supervision of visitors, who are restricted to certain areas.

Three Japanese Relocation Centers Established

When the Army ordered the evacuation of persons of Japanese ancestry from critical areas on the Pacific coast, three Reclamation projects with undeveloped public land were selected by the War Relocation Authority as sites for relocation centers: The Tule Lake division of the Klamath project in California; the Gooding division of the Minidoka project in Idaho; and the Heart Mountain division of the Shoshone project in Wyoming.

Housing for 16,000 evacuees had been about completed on the Klamath project. Plans were formed to subjugate and bring into production a possible maximum of 21,000 acres. Housing construc-

tion for 10,000 evacuees on each of the other two centers was well under way. The Minidoka project was to provide 17,000 acres of land for irrigation and the Shoshone project 27,800 acres. Products from these lands are expected to provide subsistence for the evacuees.

The Army Engineers construct the housing and community facilities at the centers. The Bureau of Reclamation supervises the construction, by the evacuees, of the additional irrigation facilities on the projects. Funds for the construction will be provided by the War Relocation Authority, which will operate the centers. The evacuees acquire no rights in the land, a portion of which is expected to be opened for homestead settlement under the Reclamation law at the close of the war.

Consideration was being given to the employment of Japanese evacuees on construction work of Reclamation projects in place of Civilian Conservation Corps enrollees and Work Projects Administration workers.

Columbia Basin Investigations Field Work Virtually Completed

Field work in connection with the 28 joint investigation problems of settler location on the Columbia Basin project in Washington is virtually complete. Results of the field studies are being collated and integrated for application to the actual settlement phase of the project development. Funds have been appropriated by Congress for starting construction of the irrigation system. But construction cannot start until pending legislation authorizing the work is enacted, or repayment contracts are executed by the irrigation districts of the project. The Bureau will be prepared to launch the settlement phase of this project, to extend ultimately to 1,200,000 acres, as soon as water becomes available for irrigation.

Predevelopment Studies Started on Gila Project

Steps were taken to initiate a program of predevelopment on lands of the Yuma Mesa division of the Gila project, Arizona, in conformity with a directive from the Senate Committee on Appropriations. A committee was appointed to study the economic and agricultural aspects of the practical problems confronting settlers on the type of arid desert soil which characterizes mesa lands of this section of Arizona. Through the active cooperation of the college of agriculture, University of Arizona, experience gained by that institution on its experimental plot on the Yuma Mesa has been used in guiding the program. An area of 5,500 acres is expected to be leveled, put under ditch, and planted to alfalfa.

Columbia Basin Investigations Field Work Virtually Completed

Field work in connection with the 28 joint investigation problems of settler location on the Columbia Basin project in Washington is virtually complete. Results of the field studies are being collated and integrated for application to the actual settlement phase of the project development. Funds have been appropriated by Congress for starting construction of the irrigation system. But construction cannot start until pending legislation authorizing the work is enacted, or repayment contracts are executed by the irrigation districts of the project. The Bureau will be prepared to launch the settlement phase of this project, to extend ultimately to 1,200,000 acres, as soon as water becomes available for irrigation.

Predevelopment Studies Started on Gila Project

Steps were taken to initiate a program of predevelopment on lands of the Yuma Mesa division of the Gila project, Arizona, in conformity with a directive from the Senate Committee on Appropriations. A committee was appointed to study the economic and agricultural aspects of the practical problems confronting settlers on the type of arid desert soil which characterizes mesa lands of this section of Arizona. Through the active cooperation of the college of agriculture, University of Arizona, experience gained by that institution on its experimental plot on the Yuma Mesa has been used in guiding the program. An area of 5,500 acres is expected to be leveled, put under ditch, and planted to alfalfa.

The program has the double purpose of conditioning the land for settler operation and of preparing an area for commercial plantings of guayule or other rubber-bearing plants, should they be required for war.

The experience gained in predevelopment of Yuma Mesa lands will be unique in its field. No other similar large area has been irrigated in the West. In order to assist future settlers in solving complex problems as to varieties of crops best adapted, the application and amount of irrigation water, settlement, and a host of similar subjects, the Bureau of Reclamation is advancing this work as rapidly as its authority will permit.

Central Valley Studies Undertaken

The rapidly converging problems of the agricultural and industrial economy of the Central Valley project area, associated with the construction of Shasta Dam, Friant Dam and other project works, are under intensive study by the Bureau and more than 50 cooperating agencies, Federal, State, and local.

The prime objective of the Central Valley studies is to direct its vast potentialities as rapidly as possible into war work. As these potentialities develop into realities of power for war industry, stabilized water supplies to lands now irrigated, more water for industrial plants, and new agricultural lands, the Bureau is working out the details of project administration.

As a second objective, the Central Valley studies will establish guideposts for the utilization of power, water, and land in a long-range program.

Construction Results

Five Dams Completed

The Bureau of Reclamation brought to completion 5 of the 15 storage dams under construction on irrigation projects. Three of the completed dams—Grand Coulee, Friant, and Marshall Ford—are the first, fourth, and fifth largest concrete dams in the world.

New electric generating equipment greatly increased the operating capacity of 28 plants on Reclamation projects. Also erected were 274 miles of high-voltage transmission lines.

The storage capacity of Reclamation reservoirs at the end of the fiscal year was 61,610,283 acre-feet, an increase of 13,845,680 acre-feet—29 percent—over the July 1, 1941, capacity. Active storage content, available for power, irrigation, domestic and industrial use, was 47½ million acre-feet compared with 41½ million last year.

Statistically, the year showed the following additional construction: 260 miles of canals, 79 miles of drains, and 2,888 canal structures; 556 culverts, 48 flumes, 183 bridges; 259 miles of roads; 169 miles of telephone lines; 89 miles of pipe line; 13 tunnels of a total length of 38,655 feet; and 2 miles of railroad line. Placed in dams and other structures were 3,668,333 cubic yards of concrete, 2,247,653 cubic yards of earth, and 736,591 cubic yards of rock. Excavated in operations: 22,269,750 cubic yards of earth and rock. Used for concrete in structures: 4,156,572 barrels of cement.

The following dams were completed during the year: Grand Coulee Dam (Columbia Basin project, Washington), 9,926,005 cubic yards in volume, a straight-gravity concrete structure creating a reservoir with an estimated storage capacity of 9,700,000 acre-feet; Friant Dam (crest height was reached but the spillway gates and outlet works were not yet installed), (Central Valley project, California), 2,045,860 cubic yards in volume, a straight-gravity concrete structure creating a reservoir of 520,550 acre-feet capacity; Vallecito Dam (Pine River project, Colorado), an earth and rock-fill structure with a reservoir capacity of 129,675 acre-feet; Marshall Ford (Mansfield) Dam (Colorado River project, Texas), 1,864,000 cubic yards in volume, a straight-gravity concrete structure (with earth and rock-fill embankments of 1,715,000 cubic yards) with a reservoir capacity of 3,120,000 acre-feet; and Deer Creek Dam (Provo River project, Utah), an earth and rock-fill structure with a reservoir capacity of 150,000 acre-feet.

Two More Power Plants

Two of the newly completed dams—Grand Coulee and Marshall Ford—have power plants. When fully installed Grand Coulee's plant will have by far the largest installation in the world. Marshall Ford was in full operation at the end of the year.

Construction work was being pushed on more new plants at Parker, Green Mountain, Shasta, Keswick, and Anderson Ranch Dams.

The capacity of Boulder Dam; bulwark of war power in the Pacific Southwest, was being increased at a tremendous rate. As the fiscal year closed a large generator was being tested for operation and another was being rushed to completion for operation in December 1942. In addition, a third was ordered with high priority to supply a huge magnesium plant near the dam.

Water Conservation Program Progresses

Construction proceeded on 6 projects of the water conservation and utilization program to stabilize agriculture and employment in

14 • *Report of the Secretary of the Interior*

the Great Plains and other semiarid areas to the westward most seriously affected by periodic droughts. The irrigated and producing area of a seventh project, under construction but already in operation, was increased. The 7 projects when completed will irrigate a total of 85,320 acres of land and benefit nearly a million acres of range.

Progress was retarded, however, by the imminent disbandment of the Civilian Conservation Corps, a large reduction in Work Projects Administration forces (both agencies contribute nonreimbursable labor to construction of water conservation and utilization projects) and restrictions on critical materials.

The need for this type of small project as a safeguard against drought and unemployment is unabated despite more rainfall in the Great Plains.

The Bureau carried on investigations of potential development of this type for inclusion in its shelf of projects to provide employment and maintain established communities at the close of the war.

Forty Years of Construction

In the 40 years of its existence as a Federal agency the Bureau of Reclamation has placed in operation 45 irrigation projects. In the construction of these wealth-producing projects the Bureau has built 166 dams; 28 power plants; 5,678 miles of high-voltage transmission lines; 372 pumping plants; 16,277 miles of main canals and laterals; 5,010 miles of ditches and drains; and 208,931 canal structures. It has built 14,255 bridges, 23,060 culverts and 6,475 flumes, and bored 380 tunnels of a combined length of 105 miles. It has laid 2,264 miles of pipe and built 3,994 miles of road.

The Bureau has excavated 603,115,119 cubic yards of earth and rock and has used 35,195,538 barrels of cement in building irrigation structures containing 30,834,046 cubic yards of concrete—enough to pave a standard two-lane highway around the world at the equator.

Denver Laboratory a Crucible of Construction

The crucible of Reclamation engineering work is the expert-manned laboratory of the Bureau at Denver, Colo. Designs and materials for structures are submitted to intensive study and actual test by qualified engineers, some of international reputation. The applied science not only has insured sound, lasting, low-cost structural work but has saved the Government millions of dollars. Nearly \$6,000,000 was saved in the cost of Grand Coulee Dam alone by laboratory analysis of available cements and refinements in structural design as a result of exhaustive laboratory research.

Grand Coulee Dam Finished

The final bucket of the 9,926,005 cubic yards of mass concrete was placed in Grand Coulee Dam on the Columbia River in Washington. The pumping plant foundation and the left powerhouse were completed in December and work commenced on the right powerhouse.

Cooling of the mass concrete, in progress 5 years and requiring 2,000 miles of 1-inch pipe for circulating chilled river water, was completed in January.

The first big Grand Coulee generator went on the line October 1, the second on January 29, and the third on April 7. Two station-service generators started operating on March 22, 1941, because of the urgent need for power for Northwest defense industry. Contracts were also awarded during the fiscal year for additional big machines. In April, preparations began at Coulee for the installation of some generators originally purchased for the Shasta power plant on the Central Valley project. This shift was an incisive war measure recommended by the War Production Board. It makes additional power available to war industry practically a whole year sooner. The generators were to start operating before the end of 1942.

Completed during the year was the work of mapping and classifying 2,000,000 acres below the dam, and the appraisal of 1,200,000 selected fertile acres which ultimately will be irrigated, creating homes and livelihood for a third of a million persons.

The reservoir reached spill height on June 1. A tremendous cataract—larger in volume than Niagara Falls and twice as high—poured over the spillway down the face of the dam. The event was hailed as a wartime baptism of Grand Coulee's important role in supplying power to the Pacific Northwest.

Migratory fish conservation work was continued successfully to save salmon and fighting steelhead trout of the Columbia which were blocked by Grand Coulee's massive wall of concrete. Two hatcheries were in operation—at Leavenworth and at Entiat—under the direction of the Fish and Wildlife Service.

Central Valley Construction Advanced

Completing the relocation of the Southern Pacific Railroad around the Shasta Reservoir, placing the final cubic yard of concrete in Friant Dam, and commencing work on Keswick Dam and power plant were outstanding events on the Central Valley project, California.

Shasta Dam, a concrete gravity structure, 602 feet high (second in height only to Boulder) with a crest length of 3,500 feet, was 66 per cent completed. More than half the estimated 6,230,000 cubic yards

16 • *Report of the Secretary of the Interior*

had been placed. Concrete work on Shasta power plant was nearing completion.

Relocation of 36 miles of the main line of the Southern Pacific Railroad from the Shasta Reservoir site to a shorter new line outside the reservoir was completed in March. The new line is 30 miles long and includes 12 tunnels with a total length of $3\frac{1}{2}$ miles and 8 major bridges, including the highest double-decked bridge in the world, over the Pit River.

Migratory fish conservation, necessary for the protection of the salmon industry, was begun. Fish will be caught in traps at Keswick Dam and Balls Ferry, and transported by tank trucks to the Coleman station on Battle Creek, which is under construction.

Work was started on Keswick Dam and power plant, 9 miles downstream from Shasta. The structure will be operated to reregulate the variable releases from the Shasta power plant and generate power.

Friant Dam on the San Joaquin River reached crest height in June with the placing of 2,045,860 cubic yards of concrete. The spillway gates and outlet valves were not installed, however, owing to lack of priorities. The straight-gravity structure is 320 feet high with a crest length of 3,430 feet.

Work was continued during the year on the first section of the 37-mile Madera Canal, one of two main canals leading from Millerton Lake, the 520,550 acre-foot reservoir formed by Friant Dam.

Through a section of Contra Costa canal in the Sacramento-San Joaquin delta area domestic and industrial water was being supplied to the city of Pittsburg.

Boulder Dam Supplies War Power

Boulder Dam on the Boulder Canyon project of Arizona-Nevada-California supplied increased war power for Pacific Southwest industry. On October 9 another generator went on the line. The October installation made the Boulder plant the largest in the world.

Colorado-Big Thompson Tunnel Driven 5 Miles

At the rate of more than 40 feet a day workmen drilled through the granite backbone of the Rocky Mountains, holing out the 13-mile Continental Divide Tunnel on the Colorado-Big Thompson project, Colorado. The tunnel will shunt Colorado River headwaters from the western to the eastern slope of the mountain. It was more than 8 miles complete on June 30; nearly 5 miles were excavated during the preceding 12 months. En route to sugar beet fields and other crops the irrigation water, after passing through the tunnel, will energize 6 power plants.

On the west slope work on Green Mountain storage dam and power plant proceeded with rapidity. The power plant is due to begin operating in February 1943.

In December 1941 the diversion and outlet tunnel was started for Granby Dam and by June 30 was 62 percent complete.

Deer Creek Dam Finished on Provo River Project

Deer Creek Dam on the Provo River about 14 miles northeast of Provo, Utah, was completed in October 1941. This storage dam is the second largest earth and rock-fill dam to be built by the Bureau. It is 235 feet high, 1,256 feet long, 2,809,800 cubic yards in volume, with a storage reservoir capacity of 150,000 acre-feet.

Also completed was a 9-mile section of the 40-mile Salt Lake Aqueduct on which work is being pushed with all possible speed. The aqueduct will provide domestic and industrial water for Salt Lake City. A contract was awarded to enlarge the Weber-Provo Canal.

All-American Canal Supplies Entire Imperial Valley

Operation of the All-American Canal—the country's largest irrigation canal, 242 feet in maximum width at water surface, 80 miles long extending from the Colorado River to the west end of the Imperial Valley, deep enough to float an ocean-going vessel—was extended throughout the Imperial Valley during the fiscal year.

On the 131-mile Coachella branch which stems from the All-American Canal, 81 miles are excavated; also structures along 47 miles are complete.

Rapid Progress on Anderson Ranch Dam

Excellent progress, with work 23 percent complete on June 30, was made during the fiscal year on Anderson Ranch dam and power plant, contract for which was awarded August 1941.

Located about 20 miles northeast of Mountain Home, Idaho, on the South Fork of Boise River, the structure will be the highest earth and rock-fill dam in the world—444 feet from the lowest point in the foundation cut-off to crest. A multiple-purpose development, the structure is also the largest dam of its type undertaken by the Bureau to date—9,600,000 cubic yards as designed.

The 500,000 acre-foot reservoir to be formed by the dam will provide a needed supplemental water supply for more than 300,000 acres of farm lands in the Boise Valley and control floods. The power plant will offset deficiencies in southern Idaho and northern Utah.

Marshall Ford Dam Finished

Marshall Ford (Mansfield) Dam on the Colorado River, about 18 miles northwest of Austin, Tex., was completed in May. It is a concrete structure of the straight-gravity type, 270 feet high, with an earth and rock-fill wing embankment at the left abutment 105 feet high and 4,910 feet long. With an over-all length of 7,333 feet, the dam contains 3,579,000 cubic yards of concrete, earth, and rock. The reservoir of 3,120,000 acre-foot capacity will provide flood control in addition to water for power generation.

Parker Power Plant Almost Ready for Operation

The powerhouse and installation of electrical machinery at Parker Dam, Arizona-California, neared completion. Construction of the Phoenix terminal substation was also in progress. On November 3 a contract was awarded for building a 123½-mile transmission line from Phoenix to Tucson, and a 50-mile line to connect the Gila substation at Blaisdell, Ariz., with drop No. 4 on the All-American canal in California.

Water Made Available for New Yakima Land

Approximately 50 miles of the 99-mile Yakima Ridge canal on the Roza division of the Yakima project in Washington were completed on June 30. Water for the irrigation of 6,630 acres was made available for the 1942 season.

On the Tucumcari project in New Mexico, earthwork and structures on a 25-mile section of the 75-mile Conchas main canal were completed, also three tunnels with a combined length of 3.8 miles.

On the Gila project in southwestern Arizona pumping plant No. 1 was completed in November. Installation of three pumps was started in December. Earthwork, structures and concrete lining for canals and laterals on unit No. 1 of the Yuma Mesa division were about half complete.

Canal and lateral construction was in progress on the Heart Mountain division of the Shoshone project, and the Riverton and Kendrick projects, all in Wyoming; the Owyhee project in Oregon-Idaho; and the Deschutes project in Oregon. Work was continued on the Wickiup Dam and canal system on the Deschutes project, using Government and CCC forces. The Cody-Thermopolis transmission line on the Shoshone project was completed in November. The Modoc unit of the Tule Lake division of the Klamath project, Oregon-California, was under construction.

Davis Dam Contract Awarded

A contract was awarded in June for construction of Davis Dam and power plant on the Colorado River about 67 miles downstream from Boulder. The dam will be an earth and rock-fill structure 200 feet high with a volume of 4,230,000 cubic yards, forming a reservoir of 1,940,000 acre-foot capacity.

Palisades Dam Authorized

Palisades Dam project on the Snake River in Idaho was authorized for supplemental storage and power generation under the 1939 Reclamation Project Act. Changed plans necessitated reauthorization of the Rapid Valley project on Castle Creek in South Dakota. Both projects include earth dams.

Field Investigations in Full Swing

Engineering investigations have two major objectives in connection with the war program: First, to determine the best method of providing additional electric power to avert a shortage in vital production areas of the West. Second, to prepare a reservoir of feasible irrigation and multiple-purpose projects on which construction can be quickly launched to provide employment and settlement opportunities at the close of the war.

Studies have been made of numerous hydroelectric power sites and steam plant installations. The major purpose of the steam developments would be to firm the power from and balance the output of existing or proposed hydroelectric plants.

The following 27 power projects have been investigated:

Albuquerque (steam) near Albuquerque, N. Mex.	Heart Mountain near Cody, Wyo.
Bismarck (steam) near Bismarck, N. Dak.	Klickitat near White Swan, Wash.
Brazos River near Waco, Tex.	Kortes power near Casper, Wyo.
Bridge Canyon near Kingman, Ariz.	Lower Big Horn near Hardin, Mont.
Cabinet Gorge near Sandpoint, Idaho.	Mystic power near Reno, Nev.
Canyon Ferry near Helena, Mont.	Newark (steam) near Newark, Calif.
Debenger Gap near Medford, Oreg.	Palisades Dam near Alpine, Idaho.
Denison power near Denison, Tex.	Pelton power near Redmond, Oreg.
Detroit power near Detroit, Oreg.	Pilot Knob near Yuma, Ariz.
Dewey Reservoir near Moab, Utah.	Provo (steam) near Provo, Utah.
El Paso (steam) near El Paso, Tex.	Sacramento (steam) near Sacramento, Calif.
Five Mile Rapids near The Dalles, Oreg.	Scraper Creek near Garden Valley, Idaho.
Folsom power near Folsom, Calif.	South Dakota (steam) near Mobridge, S. Dak.
Fort Collins (steam) near Fort Collins, Colo.	

20 · Report of the Secretary of the Interior

For a reserve of irrigation and multiple-purpose projects, more than 200 potential areas were under investigation. The work was divided among the States approximately as follows:

State	Project	Basin surveys	State	Project	Basin surveys
Arizona.....	10	2	Oklahoma.....	5	2
California.....	7	4	Oregon.....	20	4

The Bureau has been reviewing flood control reports of the War Department in numerous stream basins in California. Eight reviews have been completed and 20 others are in progress. This work has been carried out under the terms of the agreement of August 14, 1939, by which the Bureau of Reclamation, the War Department and the Department of Agriculture interchange information on multiple-purpose projects. The National Resources Planning Board is the liaison agency.

Operation of Projects

Multiple Goal Pursued

Production of food, forage and fiber was the multiple goal of the operation and maintenance activities on the Bureau's irrigation projects. Foresight pointed to the time when these agricultural commodities and especially foodstuffs might have as much effect on the outcome of the war as weapons.

The Division of Operation and Maintenance from headquarters in

Denver urged all projects to respond to the growing need for essential foodstuffs and livestock by bringing all irrigable land into production. On some projects idle tracts were leased and brought into cultivation. Larger areas of withdrawn classified land were leased for expanded stock raising. The acreage planted in the spring of 1942 was an increase over 1941.

The educational program to assist farmers in making the most economical use of available water supplies, preventing soil erosion, eradicating noxious weeds and developing pasture acreages, made good progress. Motion pictures, illustrated lectures, and instructive circulars were used.

Cooperative programs with agencies of the Department of Agriculture were continued. The Farm Security Administration has been active in helping settlers on newly developed areas on several Reclamation projects. Funds were transferred during the fiscal year 1942 for the employment of specialists of the Extension Service to assist farmers on certain Reclamation projects.

The Bureau took measures to aid in the Federal program for directing excess purchasing power of the water users into non-inflationary channels. It urged retirement of outstanding debts, advance payment of Government obligations and the creation of a reserve fund to take care of post-war emergencies. Projects were given information on the Government's policy with suggestions as to methods of cooperation.

Soil and Moisture Conservation Work Continued

Soil and moisture conservation operations were continued on lands under the Bureau's jurisdiction. Work included hydrographic measurements and studies for determination of seepage losses in canals and laterals; studies of materials and demonstrations of their application as sealing agents to reduce seepage; prevention of water erosion and depletion of soil fertility; and construction of controlling structures and planting of vegetation on noncultivated land at locations suffering from extreme wind erosion.

Six Contracts With Water User Organizations Executed

Amendatory contracts under the Reclamation Project Act of 1939 to adjust annual repayments to paying ability were executed with 6 water users' organizations. Contract drafts have been completed for 5 irrigation districts, and preliminary drafts for 9. Preparatory studies were begun on contracts for 11 districts.

Under the act of 1939, reclassification of irrigable acreages has been completed on 6 projects, and was in progress on 2 others.

20 · Report of the Secretary of the Interior

For a reserve of irrigation and multiple-purpose projects, more than 200 potential areas were under investigation. The work was divided among the States approximately as follows:

State	Project	Basin surveys	State	Project	Basin surveys
Arizona.....	10	2	Oklahoma.....	5	2

The Bureau has been reviewing flood control reports of the War Department in numerous stream basins in California. Eight reviews have been completed and 20 others are in progress. This work has been carried out under the terms of the agreement of August 14, 1939, by which the Bureau of Reclamation, the War Department and the Department of Agriculture interchange information on multiple-purpose projects. The National Resources Planning Board is the liaison agency.

Operation of Projects

Multiple Goal Pursued

Production of food, forage and fiber was the multiple goal of the operation and maintenance activities on the Bureau's irrigation projects. Foresight pointed to the time when these agricultural commodities and especially foodstuffs might have as much effect on the outcome of the war as weapons.

The Division of Operation and Maintenance from headquarters in

Denver urged all projects to respond to the growing need for essential foodstuffs and livestock by bringing all irrigable land into production. On some projects idle tracts were leased and brought into cultivation. Larger areas of withdrawn classified land were leased for expanded stock raising. The acreage planted in the spring of 1942 was an increase over 1941.

The educational program to assist farmers in making the most economical use of available water supplies, preventing soil erosion, eradicating noxious weeds and developing pasture acreages, made good progress. Motion pictures, illustrated lectures, and instructive circulars were used.

Cooperative programs with agencies of the Department of Agriculture were continued. The Farm Security Administration has been active in helping settlers on newly developed areas on several Reclamation projects. Funds were transferred during the fiscal year 1942 for the employment of specialists of the Extension Service to assist farmers on certain Reclamation projects.

The Bureau took measures to aid in the Federal program for directing excess purchasing power of the water users into non-inflationary channels. It urged retirement of outstanding debts, advance payment of Government obligations and the creation of a reserve fund to take care of post-war emergencies. Projects were given information on the Government's policy with suggestions as to methods of cooperation.

Soil and Moisture Conservation Work Continued

Soil and moisture conservation operations were continued on lands under the Bureau's jurisdiction. Work included hydrographic measurements and studies for determination of seepage losses in canals and laterals; studies of materials and demonstrations of their application as sealing agents to reduce seepage; prevention of water erosion and depletion of soil fertility; and construction of controlling structures and planting of vegetation on noncultivated land at locations suffering from extreme wind erosion.

Six Contracts With Water User Organizations Executed

Amendatory contracts under the Reclamation Project Act of 1939 to adjust annual repayments to paying ability were executed with 6 water users' organizations. Contract drafts have been completed for 5 irrigation districts, and preliminary drafts for 9. Preparatory studies were begun on contracts for 11 districts.

Under the act of 1939, reclassification of irrigable acreages has been completed on 6 projects, and was in progress on 2 others.

Relief to Water Users Reduced

Relief by the extension of time for the payment of construction charges pursuant to Section 17b of the act of 1939, where water users are unable to pay such charges without great hardship, was greatly reduced. Time extensions were granted to 10 districts by the Secretary of the Interior for charges accrued for the calendar year 1941. The extensions amounted to \$322,929 or less than 11 percent of charges due from all projects, a reduction of about 50 percent of the amount granted for 1940. More prosperous conditions and improved water supplies increased the ability of the water users to pay their obligations.

CCC Suspended

Civilian Conservation Corps camp operations on Federal Reclamation projects were suspended late in the year in anticipation of the termination of CCC activities. Originally organized under the Emergency Conservation Work program, the CCC established its first camp on a Reclamation project at Guernsey Reservoir in Wyoming in 1934. On July 1, 1941 there were 43 camps.

During the past 7 years over 15,000 old wooden water control structures in canal systems were ripped out and replaced by permanent concrete structures; canals were straightened, strengthened, and rebuilt to grade and cross-section, and more than 100 miles were concrete-lined; 3,000 miles of operating roads were constructed along canal banks; dams of all types were examined, and rebuilt and repaired wherever necessary; 40,000 acres in reservoir areas were cleared of timber and debris; destructive rodents by tens of thousands were exterminated; and an aggressive campaign of weed control on Government lands was developed.

A major part of the construction on the Deschutes project, Oregon, was assigned to CCC forces. They also undertook reservoir clearing jobs on Utah projects, at Shasta Dam in California, and Vallecito Dam in Colorado. Facilities built by the CCC now provide recreation at Elephant Butte and Alamogordo Reservoirs in New Mexico, Guernsey, and Alcova in Wyoming, Minatare in Nebraska, Lahontan in Nevada, and Lake Walcott in Idaho.

CCC camps were assigned in 1942 to seven water conservation and utilization projects in the Dakotas, Nebraska, Montana, Wyoming, and Colorado, to build dams, canals and related structures.

The work of enrollees at camps on Reclamation projects trained thousands of truck drivers and tractor operators. Elementary training in concrete and masonry construction, erection of frame structures and the use and repair of hand tools were standard on job courses.

Although CCC work on Reclamation projects was far from complete when suspended, the excellent condition of the reservoirs and canal systems brought about by CCC forces is high-quality insurance against interruptions in the growing of crops on irrigated land.

Bureau Organization Being Remolded

The organization of the Bureau of Reclamation in Washington and in the field was being molded to the war pattern. Power plant construction, protection of structures against sabotage and preparation for irrigation expansion to meet war needs required an increase in personnel which more than offset military furloughs and transfers to other war agencies. The number rose from 7,636 to 8,016. The number of field offices remained at 57 but arrangements were being made to close several small ones.

Effective October 1941, the headquarters of the Operation and Maintenance division was transferred from Washington, D. C., to Denver, Colo. The accounting division, except for the chief accountant and a staff of five, also was transferred to Denver—to be designated as the central accounting office.

1. Proceeds for fiscal year, \$38,408.83.

2. Proceeds for fiscal year, \$297,639.17.

24 · *Report of the Secretary of the Interior*

The accounting division transfer was not officially effective until July 1, however, and was not reflected in the personnel employed as of June 30, 1942, in Washington, D. C.—152, including the Commissioner and Assistant Commissioner and employees detailed to other offices and agencies but carried on the Washington office salary roll. Of the 7,864 Bureau employees in the field, 1,086 were in the field headquarters at Denver under supervision of the Chief Engineer and the General Supervisor of Operation and Maintenance and 6,778 were engaged in construction or operation and maintenance activities on the projects.

Fifty supervisory engineers report directly to the Chief Engineer in Denver; 22 project superintendents or other supervising officials report directly to the General Supervisor of Operation and Maintenance. Both the Chief Engineer and General Supervisor report to the Commissioner, who is appointed by the President and serves under direction of the Secretary.

During the year 517 Bureau employees were given military furloughs. The Bureau also released several hundred engineers for civilian transfers to the War Department, Navy Department, and other war agencies.

Reclamation Fund Accretions

Accretions to the Reclamation fund created by the Reclamation Act of 1902 (table 4) brought the total cash available from this source in 40 years to \$213,173,921.75. Collections—construction and operation and maintenance repayments, water rentals, power, etc.—were \$141,266,462.78. Disbursements totaled \$339,913,575.29, leaving a balance in the fund on June 30 of \$14,526,809.25.

Construction repayment collections during the year totaled \$2,327,886.42; operation and maintenance collections amounted to \$1,253,099.50; and water rental, power, and other receipts of \$2,983,596.66 were repaid to the Reclamation fund during the fiscal year 1942.

Federal Investment Increased

Construction expenditures for all projects during the year of \$84,349,841.29 increased to \$816,768,590.05 on June 30, 1942, the Federal investment, through the Bureau of Reclamation, in irrigation, power and multiple-purpose facilities in the West (table 5).

The emphasis in the fiscal year 1942 was on facilities which will bring in power for war industries. Expenditures, however, were directed toward completion of facilities which will benefit irrigation directly through additional storage or which, through power revenues, will assist in the repayment of the cost of irrigation systems.

For the fiscal year 1943, appropriations by the Congress for the Bureau of Reclamation totaled \$89,273,270, summarized as follows:

Reclamation fund:

Operation and maintenance.....	\$1, 171, 220
Construction.....	1, 475, 840

Total.....	\$2, 647, 060
------------	---------------

General fund:

Colorado River front and levee system.....	\$47, 895
Colorado River development fund.....	399, 750
Colorado River dam fund:	
Boulder Canyon project.....	4, 999, 750
All-American canal.....	1, 000, 000
Protection of project works.....	700, 000
Construction (13 projects, investigations, etc.).....	78, 979, 340
Fort Peck power.....	499, 475

Total general fund.....	86, 626, 210
-------------------------	--------------

Grand total.....	89, 273, 270
------------------	--------------

John S. Moore, Field Supervisor in Charge of Soil and Moisture Conservation, was appointed General Supervisor of Operation and Maintenance effective September 16, 1941, succeeding George O. Sanford, retired. From Denver headquarters Mr. Moore supervises the activities of 15 projects which are operated in their entirety by the Bureau and 7 other projects which are Bureau-operated with respect to their dams, reservoirs and other reserve works. His administration also extends to 25 projects and operations conducted by water users' organizations under contracts with the United States. The Operation and Maintenance division deals with approximately 120 separate water users' organizations which are under contract with the United States.

TABLE 5.—Consolidated statement of construction cost of Reclamation projects ¹

(Note.—Specific details relating to individual projects and to power production normally contained in this report have been deleted at the request of the Office of War Information and the War Department)

Bonneville Power Administration

PAUL J. RAVEN, Administrator

DURING the fifth year of its existence, the Bonneville Power Administration greatly increased its delivery of electric energy to war industries, public-owned distribution agencies, Government agencies and private utility enterprises. The energy of the two great dams on the Columbia river—Grand Coulee and Bonneville—was utilized almost continuously on a 24-hour a day basis, and served as one of the aggressive war weapons of the United States.

At the outbreak of the war in December 1941 the Administration was already far along in its war production program and through advanced planning prepared to take on even greater war loads.

With the passage of the defense appropriation bill (H. R. 1055) in June 1940 and the lend-lease bill (H. R. 1776) in March 1941, the Administration early recognized that a tremendous increase in the generating capacity of the Nation was necessary to carry out a war production program.

Early in 1941 the Administration recommended acceleration of installations of generating units at both Bonneville and Grand Coulee Dams and the speeding up of construction of necessary facilities to transmit the additional power to load centers.

As a result additional generating units were authorized at Bonneville Dam and at Grand Coulee Dam. In addition Shasta units were transferred from California for installation at Grand Coulee.

There was also appropriated to the Administration the sum of \$48,858,500 for the fiscal year 1942 for the construction of transmission and substation facilities.

The declaration of war and decisions to locate many war loads east of the Cascades made necessary certain major changes in the Administration's 1942-43 program. It nevertheless found the Administration in a position to meet the war strategy with changes only as to

location of additional lines and substation facilities, thus justifying the basic planning of the system.

The impact of the war program in the area served by the Administration was reflected by war contracts totaling \$1,259,449,000, covering the manufacture of aircraft, ships, ordnance, military and naval supplies and the construction of barracks, docks and munition depots, which had been awarded in Oregon and Washington, between June 15, 1940, and December 31, 1941. This figure does not include the purchase of raw materials such as aluminum, copper, zinc, lead and timber produced in the area.

The Columbia River projects, which had been assailed as "white elephants in the wilderness" during their building, had become an integral part of the war might of the United States.

As the year ended the Administration operated a transmission system containing 1,748 miles of transmission lines and 37 substations.

The Administration acted to integrate all of the Northwest's power resources to provide greater security of service for the growing war load. In addition to its interconnections with the public systems of Seattle, Tacoma, Centralia and Grays Harbor, Wash., and Eugene and McMinnville, Oreg., the Administration interconnected its system with those of the Washington Water Power and Pacific Power & Light Companies. An interconnection with the Portland General Electric Co. was continued through the year.

Public-owned agencies, established for the purpose of distributing Columbia River power without profit and entitled to preference in purchasing Columbia River power under the Bonneville Act, voluntarily postponed their plans for construction of new power facilities until after the war.

Those public-owned agencies which were already in business and receiving Columbia River power continued to make steady reductions in rates in the face of rising costs attendant on the war.

During the year public ownership progress was steady. Eleven public agencies in Washington and Oregon were successful in purchasing either all or part of privately owned utility systems. Two other Oregon Peoples' Utility Districts approved revenue bond issues for the purchase of existing utility properties for \$885,000. During the year, 17 public agencies executed new contracts and 9 public agencies revised existing contracts with the Bonneville Administration for the purchase of power. The Administration's power deliveries to public agencies increased in the 1942 fiscal year.

The Year's Power Sales

Both from the standpoint of actual power deliveries and from the standpoint of "demand value" of contracts executed, the Administration's power sales showed heavy gains during the fiscal year 1942.

Of power actually delivered, war industries, comprising principally aluminum and shipbuilding, purchased 81.4 percent; private utility companies, 14.7 percent; public agencies, 3.8 percent; and Federal agencies, 0.1 percent.

Twenty-six new power contracts were executed during the year, bringing the cumulative total of signed contracts to 70.

TABLE 1.—New prime power contracts executed fiscal year 1942

Class	No.	Class	No.
Districts.....	6	Industries.....	4
Cooperatives.....	11		
Federal agencies.....	5	Total ¹	26

¹ In addition to these, four public utility district contracts, four REA cooperative contracts, two contracts with municipalities, one industrial contract and one contract with a private utility were revised as to contract demand.

The War Market

By June 30, 1942, industrial power contracts and commitments dominated the Administration's marketing program and construction plans. Industrial loads, all of them for war production, accounted directly for 92 percent of current contracts and commitments for 899,920 kilowatts.

The economics of the Pacific Northwest and of the electro-process industries of the country had long indicated that industrial power sales would play a major role in the development of the Northwest region.¹

At the close of the 1941 fiscal year, the Bonneville Power Administration had reported to the Department of the Interior some 20 types of industry which, by reason of their raw material, power and market needs, were especially feasible of establishment in the Pacific Northwest.² During 1942, the Bonneville Power Administration agreed to serve 5 of these 20 types of industry.

Shipyards Added to Load

In addition to industries of the "electro" type, the war brought a new market for power in the development of a huge shipyard industry. The Administration agreed to serve three shipyards in the Portland, Oreg.-Vancouver, Wash., district. The three new yards required a total supply of power which would not have been available in the lower Columbia district had it not been for the Bonneville project. New electric welding processes which require large blocks of electricity have reduced shipbuilding time from 250 days to as low as 10 days.

¹ In addition, Defense Plant Corporation was being supplied with power in eastern Washington as to fiscal year ended, prior to formal signing of contract. Other commitments also had been made (see table 3).

Market Development Emphasized

In order to provide a solid foundation for the new electro industries of the region and to insure their continuous operation, technicians of the Administration assisted materially in the establishment of other industries, the products of which are critically needed in the manufacture of the materials and chemicals produced because of the availability of Columbia River electric power.

A proposal for a coke plant sponsored by a local industrial group was prepared, presented and carried through to approval by war agencies with the assistance of the Administration.

Similarly, ferro-alloys manufacturers and calcium carbide producers were assisted in obtaining suitable grades of raw materials in Oregon and Washington. Bonneville technicians also cooperated in the establishment and expansion of a plant in Utah, for the production of alumina from alunite ores and clays. This was a significant step since inexhaustible deposits of aluminum bearing clays are available on the Bonneville transmission system in the Castle Rock region of Washington. All these activities were undertaken with the firm conviction that suitable low-cost raw materials could be made available from the area's natural resources for the metallurgical and electro-chemical plants in the region to insure their continuity of operation.

These activities were carried on in conformance with the policy expressed by the Secretary of the Interior that the west is not only

building for the war, but for its future and that of the Nation. Every electro industry established during the past 4 years in the Pacific Northwest is part of a pattern of industrial development providing for the complete processing of Northwest resources from raw materials to consumer goods.

The Public Power Market

At the close of the year a total of 53 contracts between the Bonneville Administration and public utility districts, municipalities, cooperatives and Federal agencies had been executed.

Seventeen contracts with public agencies were executed during the 1942 fiscal year.

By the end of the year the cumulative total of Bonneville's public agency contracts included 17 with utility districts, 12 with municipalities, 19 with cooperatives, financed in all but one case by the Rural Electrification Administration, and 5 with Federal agencies.

Twenty-six of these fifty-three public agencies were distributing Columbia River power and nine cooperatives and two public utility districts were assured of Columbia River power almost immediately through interconnection agreements between the Bonneville Administration and privately owned utilities.

As of June 30, 1942, the Administration's contracts to public distribution agencies were as follows:

TABLE 3.—Contracts with public agencies¹

Progress of Public Agencies

The public agency market for Columbia River power is largely dependent upon the ability of public-owned electric utilities to enter active business and become purchasers of power at wholesale.

For this reason the Administrator continued to accede to the wishes of the local utility districts, to serve as their official negotiator for the purchase of privately held utility systems.

One municipality, six cooperatives, and four public utility districts in Washington and Oregon reported success during the fiscal year in purchasing either all or part of privately owned utility systems.

The Skamania, Grant, Lewis, and Klickitat County Public Utility Districts, the city of Grand Coulee municipal system, the Orcas Light & Power Co. (REA), and the Stevens County Electric Cooperative each purchased all or part of privately owned utility systems in Washington. In Oregon the Central Electric, Coos Electric, Lane County Electric, and North Douglas Electric Cooperatives all completed purchases of all or part of utility systems.

The Clatskanie Peoples' Utility District and the West Coast Power Co. reached agreement to purchase the company's Clatskanie division for \$150,000 and the Central Lincoln District agreed to purchase the company's coast division for \$735,000. Revenue bonds were approved by voters in the two districts.

The Tillamook (Oreg.) Peoples' Utility District also reached an agreement to purchase practically all of the Mountain States Power Co. properties in Tillamook County for \$625,000.

The Public Agencies' Operating Record

On June 30, 1942, 26 public agencies had been distributing Columbia River power for periods up to 36 months. The success shown in their operations records was significant in its illustration of the possibilities which the public power market holds for the distribution of Columbia River power. Since the Federal statute under which the Bonneville

Administration operates makes public agencies and cooperatives the Administration's preferred market, the record of these first small public-owned utilities assumed double significance.

In 1939, 1940, and 1941, and the first half of 1942 the public electric systems in Oregon and Washington made rate reductions amounting to more than \$1,417,000. As a result of these reductions power consumption increased, thus permitting gross revenues to remain stable.

Substantial reductions in rates have been made by the public systems of Canby, Cascade Locks, Columbia County REA, Cowlitz County PUD, Drain, Forest Grove, Ellensburg, Eugene, Grays Harbor PUD, Kittitas County PUD, Lewis County PUD, McMinnville, Monmouth, Nehalem Valley REA, Pacific County PUD, Seattle, Skamania PUD, Tacoma, Wahkiakum PUD, Centralia, Douglas Electric Cooperative, Salem Electric Cooperative, Columbia County REA, and the City of Grand Coulee.

The Clark County Public Utility district signed contracts during the fiscal year to supply Columbia River power to a Federal Public Housing Authority project at Vancouver, Wash., and to one war industry. The housing project, which may be enlarged, included 1,000 permanent houses, 4,000 temporary houses, dormitories for 4,400 men, and 2,000 units of family apartments. These contracts gave the district a greater load than that supplied by the two private utility companies serving Vancouver.

One of the private utilities offered to supply the load for the 1,000 permanent houses for about \$84,600 a year. The district is supplying this load for approximately \$36,190. Housing Authority officials say it is the lowest power rate it has received in the United States.

During the year Monmouth, Oreg., made its second rate reduction. McMinnville, Oreg., also effected its second rate reduction since contracting for Bonneville-Grand Coulee power. The reduction brought McMinnville rates into line with the Bonneville standard resale rate and resulted in a further substantial saving to customers.

Typical of rural cooperative performance was the record of the Wasco Electric Cooperative in the mid-Columbia River valley. During the first 12 months of its operation with Columbia River power, the Wasco cooperative brought electricity to 365 Wasco County farmers who had never before had access to electricity. Nearly 340,000 kilowatt-hours were sold by the cooperative. Revenues totaled nearly \$10,000.

Cascade Locks (Oreg.) City Light, by June 1941, had reduced rates 31 percent, yet as a result of increased use of electricity by customers maintained its revenue from power sales.

Customers of this municipal system with their June 1942 bills received another reduction of 15 percent in commercial rates.

Future Industrial Sales

During the early months of the 1943 fiscal year the Administration expected to execute power sales contracts for the delivery of Bonneville and Grand Coulee energy to new war industrial plants, in addition to additional blocks of power to existing industrial customers. The Administrator had made definite commitments during 1942 to supply these plants and additions. It was expected that the full demand would be required by these plants before the middle of the 1943 fiscal year.

Contracts for these new plants were in advanced negotiation at the close of the fiscal year 1942. Several of the plants were actually under construction. The list follows:

¹ Energized May 1, 1942.

Prospective power sales to war and other industries in the Northwest for the fiscal years beyond 1944 were, of course, progressively more difficult to estimate. For this reason, in planning future generating and transmission capacities, the Administration endeavored to plan a power system of sufficient flexibility to supply not only normal load growth, but any fluctuations in load which might grow out of a war need extending over a number of years.³

Other Future Sales

The Bonneville Administration's estimates of power sales from its own system for the years 1943 through 1945 included four other classes of customers. These were non-Federal electric utilities, public power agencies, military establishments, and war housing projects which, among them, were estimated to require a combined peak delivery of 576,200 kilowatts by 1945.

³ For details see Six-Year Construction Program for Bonneville Power Administration, revised as of June 1942.

Service for Future Loads

In conformance with Executive Order No. 8455, the Bonneville Administration during the 1942 fiscal year revised its 6-year construction program in the light of new factors which developed during the year.

These new construction estimates of the Administration were conditioned by two fundamentals: First, the fact of the war need, and second, the fact that almost no other utility within the region has definite plans for expansion of its generating capacity.

These two factors meant that both normal growth in power consumption within the region and growth in power demand incident to a war of uncertain duration would have to be met in their entirety by the region's Federal power projects.

In planning future generation and transmission capacity, therefore, the Bonneville Administration planned to fill not only the needs of its own customers but the expanding needs of the region as well.

In the formulation of these plans three things became at once apparent: (1) that immediate material shortages would compel slight reductions in the over-all power consumption of the region in 1943 and 1944 below the Administration's estimates of June 1941, which were made contingent upon a recommended earlier installation of generators; (2) that beginning with 1945 the region's power needs would increase, in an annually expanding ratio, above the Administration's estimates of June 1941; and (3) even with the slight reduction of use in 1942 and 1943, additional generating capacity would be required in the Pacific Northwest over and above both existing and authorized capacity.

At the end of 1944, including units definitely approved for construction at the end of the 1942 fiscal year, the installed capacity of Bonneville and Grand Coulee Dams will be an insufficient total in view of the region's predictable needs.

New Generating Capacity Needed

Because of the potential power shortage in the region, the Bonneville Administrator jointly with the Bonneville Advisory Board, on February 10, 1942, urged that studies be completed on the 10 hydro-electric power projects in the Northwest which are known to be feasible of early construction. In addition the Administrator recommended immediate construction of another dam on the Columbia River accessible to the existing Bonneville-Grand Coulee transmission system and to the larger load centers of the region.

It was further recommended that new generator installations should be scheduled immediately because of the time required to complete

such installations. Only in this way could an adequate supply of power be assured for what might be the critical years of 1946 to 1949.

To carry this tremendous capacity from the power stations on the Columbia River to the power market centers of the region, extensive additions to transmission and terminal facilities of the Pacific Northwest will be required.⁴

The Year's Construction

The congressional appropriation of almost \$23,000,000 received by the Bonneville Administration at the start of the 1942 fiscal year instituted a construction program almost twice that of the previous fiscal year.

This enlarged program was again increased by an additional appropriation of \$30,000,000 in December 1941. Since the war program required the use of critical materials for the production of war goods, the Administration's program was limited after December 7 to only those extensions of its system which contribute directly to the prosecution of the war. As a result the Administration held in reserve a considerable portion of its construction funds at the end of the fiscal year pending determination of their detailed use.

New Facilities Energized

The Administration placed 586 miles of transmission line and 530,050 kva of substation capacity in service during the fiscal year. This represents an average of 2.3 miles of transmission line and 2,100 kva of substation capacity completed for each working day.

At the close of the fiscal year the Administration operated a transmission system containing 1,748 miles of transmission lines and 37 substations.

Design work was in progress on 13 substations and 19 major substation additions and on 8 transmission lines totaling 437.3 miles in length.

Construction was in progress on substations and additions and on transmission lines having a total length of 629.7 circuit miles.

The Year's Operations

As an operating utility the Bonneville Administration faced new operating problems affecting both the agency's management procedures and its electrical operations.

Until the last quarter of the fiscal year the organization was expanding to meet the immediate needs of building new transmission

⁴ For detailed discussion of estimates of generation and transmission see Bonneville Power Administration construction program revised as of June 1942.

facilities to serve war industries. During that period production increased markedly until it reached a processing peak of obligating over \$7,000,000 per month. New production records were attained and all commitments to war industries fulfilled on schedule.

When the national shortage of copper, steel, aluminum and other metals became critical, however, these production levels began to decline until, during the latter quarter of the year, previously approved construction plans had to be postponed with a resultant tapering off in personnel and production.

Some copper, aluminum, steel and other critical materials originally ordered under proper priorities of the War Production Board could not be used under the curtailed program of construction later initiated by the same agency. A complete inventory of these materials was made and submitted to the War Production Board, and arrangements made to make it available to other war agencies as needed.

Financial Statements

Studies were continued during the year for the purpose of further simplifying the Administration's accounting methods.

Financial or general ledger accounts were kept in accordance with requirements of the General Accounting Office and cost accounts were kept in conformance with the Federal Power Commission's system.

The Power Supply and the Future

Both the law and the power economics of the Pacific Northwest make it mandatory upon the Federal Government to provide sufficient generating and transmission facilities to supply the region's ever-increasing power demands, whether for war or for peace.

In terms of immediate need, competent studies ⁵ forecast a serious shortage of power for war production by 1944 unless new power sources are immediately developed throughout the Nation.

In terms of post-war requirements, the Bonneville Administration's own studies ⁶ indicate a need of nearly 5 million kilowatts for normal use in the Northwest in 1949.

The Administration does not anticipate any power surplus when the war ends. Generators now installed or being installed are worked to capacity. Even the end of the war and the possible slow-down of a number of industrial plants would permit only a normal and necessary reserve of power and withdrawal of generating units for necessary reconditioning and replacement of worn parts.

⁵ Will Electric Power Be a Bottleneck? by Louis Marlio, Brookings Institution, Washington, D. C., 1942.

⁶ See Bonneville Power Administration's 6-year construction program, revised as of June 1942.

In its consideration of the future, the Bonneville Administration has concluded:

More generating capacity must be developed.—Generator schedules for Bonneville and Grand Coulee in 1943 should be maintained and given the highest possible priority assistance. Grand Coulee units, which have been redesigned for installation in the second powerhouse at Grand Coulee because of the transfer of Shasta Dam generators to the present powerhouse, should be completed in 1944. This will require higher priorities for both the generators and the powerhouse than the A-2 priority now assigned them. In the last 6 months of the fiscal year 1942, short-term policies of the War Production Board had threatened the speed of all these generator installations. Finally, in order that the Pacific Northwest may contribute its share of new kilowatt capacity to be required for 1945, an immediate program should be adopted for development of an additional supply through the authorization of additional generators at Grand Coulee Dam and by construction of new hydro projects, such as those feasible of construction on the Columbia River.

In the allocation of new war industry to the Northwest, the Administration's seven-point industrial program might well serve as guide:

1. Columbia River power should be sold to such industries and on such terms as help the long run and best development of regional resources.

2. The establishment of basic electro-process industries should be followed by fabricating and supply industries so as to support the operations of the basic industries and to provide products for regional consumption at lower costs than obtained at present.

3. New feasible industries should be financed and managed as far as possible by business men of the region.

4. Research on new processes to use electric power and raw materials in the region must be stimulated by governmental agencies and the results of such research should be freely available for use by independent enterprise.

5. The opposition of established industry to new competition from Northwest industry and the attempts of any industrial groups to control large amounts of Columbia River power must be prevented.

6. Within the region, new industries should be encouraged to decentralize in accordance with the advantages of locational factors and of the "postage stamp" rate of the regional network.

7. Columbia River power should be sold on such terms as contribute to the conservation of other resources of the region and as prevent the destruction of scenic and recreational assets.

Division of Power

ARTHUR GOLDSCHMIDT, Acting Director

SUPERVISION exercised by the Division of Power over problems involved in the development of electrical energy by agencies under the jurisdiction of the Department of the Interior acquired even greater significance when the attack on Pearl Harbor transformed a condition of national emergency into a state of total war. Already established by the Secretary of the Interior in April 1941 to promote efficient coordination of the Department's power production activities, the Division was able to gear its organization to aid in the prosecution of the war program without loss of time.

Power for War

During the fiscal year the activities of the Division of Power were dedicated to the fulfillment of the purposes for which it was created, intensified by the war and the urgency that it has brought for the development of additional power for war uses and the achievement of the maximum utilization of existing plants for that purpose. During the year the installed capacity of power projects under the jurisdiction of the Department was increased by more than 500,000 kilowatts. Perhaps the most significant step in the power program during the year was the beginning of operations at Grand Coulee Dam on the Columbia River in Washington.

The Division has been constantly engaged in working for the construction of power projects which will require a minimum quantity of critical materials and can be completed with sufficient speed to warrant construction for the war program. In the fall of 1941 a comprehensive program was worked out in conjunction with the Bureau of Reclamation and the Bureau of Mines to develop 1,480,000 kilowatts of additional electric generating capacity throughout the Western States and to use it for the extraction and beneficiation of strategic minerals. This program included the more rapid completion and expansion of projects now under way and proposed immediate authorization and

38 · Report of the Secretary of the Interior

In its consideration of the future, the Bonneville Administration has concluded:

More generating capacity must be developed.—Generator schedules for Bonneville and Grand Coulee in 1943 should be maintained and given the highest possible priority assistance. Grand Coulee units, which have been redesigned for installation in the second powerhouse at Grand Coulee because of the transfer of Shasta Dam generators to the present powerhouse, should be completed in 1944. This will require higher priorities for both the generators and the powerhouse than the A-2 priority now assigned them. In the last 6 months of the fiscal year 1942, short-term policies of the War Production Board had threatened the speed of all these generator installations. Finally, in order that the Pacific Northwest may contribute its share of new kilowatt capacity to be required for 1945, an immediate program should be adopted for development of an additional supply through the authorization of additional generators at Grand Coulee Dam and by construction of new hydro projects, such as those feasible of construction on the Columbia River.

In the allocation of new war industry to the Northwest, the Administration's seven-point industrial program might well serve as guide.

1. Columbia River power should be sold to such industries and on such terms as help the long run and best development of regional resources.
2. The establishment of basic electro-process industries should be followed by fabricating and supply industries so as to support the operations of the basic industries and to provide products for regional consumption at lower costs than obtained at present.
3. New feasible industries should be financed and managed as far as possible by business men of the region.
4. Research on new processes to use electric power and raw materials in the region must be stimulated by governmental agencies and the results of such research should be freely available for use by independent enterprise.
5. The opposition of established industry to new competition from Northwest industry and the attempts of any industrial groups to control large amounts of Columbia River power must be prevented.
6. Within the region, new industries should be encouraged to decentralize in accordance with the advantages of locational factors and of the "postage stamp" rate of the regional network.
7. Columbia River power should be sold on such terms as contribute to the conservation of other resources of the region and as prevent the destruction of scenic and recreational assets.

Division of Power

ARTHUR GOLDSCHMIDT, Acting Director

SUPERVISION exercised by the Division of Power over problems involved in the development of electrical energy by agencies under the jurisdiction of the Department of the Interior acquired even greater significance when the attack on Pearl Harbor transformed a condition of national emergency into a state of total war. Already established by the Secretary of the Interior in April 1941 to promote efficient coordination of the Department's power production activities, the Division was able to gear its organization to aid in the prosecution of the war program without loss of time.

Power for War

During the fiscal year the activities of the Division of Power were dedicated to the fulfillment of the purposes for which it was created, intensified by the war and the urgency that it has brought for the development of additional power for war uses and the achievement of the maximum utilization of existing plants for that purpose. During the year the installed capacity of power projects under the jurisdiction of the Department was increased by more than 500,000 kilowatts. Perhaps the most significant step in the power program during the year was the beginning of operations at Grand Coulee Dam on the Columbia River in Washington.

The Division has been constantly engaged in working for the construction of power projects which will require a minimum quantity of critical materials and can be completed with sufficient speed to warrant construction for the war program. In the fall of 1941 a comprehensive program was worked out in conjunction with the Bureau of Reclamation and the Bureau of Mines to develop 1,480,000 kilowatts of additional electric generating capacity throughout the Western States and to use it for the extraction and beneficiation of strategic minerals. This program included the more rapid completion and expansion of projects now under way and proposed immediate authorization and

38 · Report of the Secretary of the Interior

In its consideration of the future, the Bonneville Administration has concluded:

More generating capacity must be developed.—Generator schedules for Bonneville and Grand Coulee in 1943 should be maintained and given the highest possible priority assistance. Grand Coulee units, which have been redesigned for installation in the second powerhouse at Grand Coulee because of the transfer of Shasta Dam generators to the present powerhouse, should be completed in 1944. This will require higher priorities for both the generators and the powerhouse than the A-2 priority now assigned them. In the last 6 months of the fiscal year 1942, short-term policies of the War Production Board had threatened the speed of all these generator installations. Finally, in order that the Pacific Northwest may contribute its share of new kilowatt capacity to be required for 1945, an immediate program should be adopted for development of an additional supply through the authorization of additional generators at Grand Coulee Dam and by construction of new hydro projects, such as those feasible of construction on the Columbia River.

In the allocation of new war industry to the Northwest, the Administration's seven-point industrial program might well serve as guide:

1. Columbia River power should be sold to such industries and on such terms as help the long run and best development of regional resources.
2. The establishment of basic electro-process industries should be followed by fabricating and supply industries so as to support the operations of the basic industries and to provide products for regional consumption at lower costs than obtained at present.
3. New feasible industries should be financed and managed as far as possible by business men of the region.
4. Research on new processes to use electric power and raw materials in the region must be stimulated by governmental agencies and the results of such research should be freely available for use by independent enterprise.
5. The opposition of established industry to new competition from Northwest industry and the attempts of any industrial groups to control large amounts of Columbia River power must be prevented.
6. Within the region, new industries should be encouraged to decentralize in accordance with the advantages of locational factors and of the "postage stamp" rate of the regional network.
7. Columbia River power should be sold on such terms as contribute to the conservation of other resources of the region and as prevent the destruction of scenic and recreational assets.

Division of Power

ARTHUR GOLDSCHMIDT, Acting Director

SUPERVISION exercised by the Division of Power over problems involved in the development of electrical energy by agencies under the jurisdiction of the Department of the Interior acquired even greater significance when the attack on Pearl Harbor transformed a condition of national emergency into a state of total war. Already established by the Secretary of the Interior in April 1941 to promote efficient coordination of the Department's power production activities, the Division was able to gear its organization to aid in the prosecution of the war program without loss of time.

Power for War

During the fiscal year the activities of the Division of Power were dedicated to the fulfillment of the purposes for which it was created, intensified by the war and the urgency that it has brought for the development of additional power for war uses and the achievement of the maximum utilization of existing plants for that purpose. During the year the installed capacity of power projects under the jurisdiction of the Department was increased by more than 500,000 kilowatts. Perhaps the most significant step in the power program during the year was the beginning of operations at Grand Coulee Dam on the Columbia River in Washington.

The Division has been constantly engaged in working for the construction of power projects which will require a minimum quantity of critical materials and can be completed with sufficient speed to warrant construction for the war program. In the fall of 1941 a comprehensive program was worked out in conjunction with the Bureau of Reclamation and the Bureau of Mines to develop 1,480,000 kilowatts of additional electric generating capacity throughout the Western States and to use it for the extraction and beneficiation of strategic minerals. This program included the more rapid completion and expansion of projects now under way and proposed immediate authorization and

construction of projects still in the planning stage. It also called for the integration of the Federal power resources by transmission networks. The Division has aided in the preparation of specific proposals for the development and greater industrialization of the Western States insofar as the use of power facilities is involved.

The Department's work on programs relating to the furnishing of power for war involves continuing contact and cooperation with other Government agencies, particularly the War Production Board, the Reconstruction Finance Corporation and its subsidiaries, and the Federal Power Commission. The Division serves as liaison between various agencies of the Department and the war agencies which are centralized in Washington. This work of the Division has made it possible to continue the Department's policy of decentralizing the administration of its power activities.

Arrangements for the supply of power to the magnesium plant near Las Vegas, Nev., were worked out in conjunction with the Bureau of Reclamation, the allottees of Boulder power, and Defense Plant Corporation. This transaction constitutes one of the largest single sales of power to a consumer ever consummated. Negotiations extended over a period of 6 months and at the end of the year the principal agreement and three subordinate agreements were ready for execution.

Extensive negotiations with the War Production Board were, and still are, carried on to assure the maximum war use of the Columbia River power developments through the installation of additional generators at Bonneville and Grand Coulee Dams. Authorization was secured for the installation of generators at Bonneville which will raise the capacity of the plant. Authorization of more generators for Grand Coulee was also obtained, but when it became apparent that other war demands would delay the completion of these, the Division participated in an arrangement whereby generating units designed for the Central Valley project in California, and ready ahead of time through the foresight of the Bureau of Reclamation, were transferred to the Grand Coulee powerhouse to bring power to the new metallurgical and shipbuilding industries in the Northwest sooner than could otherwise have been done.

In seeking the full utilization of the Department's power resources the Division has sought to have war plants located on a sound basis, looking to lowering costs to war industries and the development of a balanced economy in the regions involved. It has also endeavored, to the fullest extent commensurate with war production needs, to secure the location of plants which might continue to operate after the war and thereby contribute to the post-war readjustment and to safeguarding the Government's investment in the facilities.

Every effort has been made to effectuate the consolidation or pooling of the power resources of the Department in such a manner as to

secure the greatest efficiency and to make available maximum quantities of power in various areas. The appropriate war agencies have been kept fully and promptly advised of the quantity and location of power available from the Department's projects and have otherwise had the benefit of complete information as to the capabilities of these projects. Initial steps in the creation of a power pool in the State of Arizona had been taken at the end of the year. Similarly, a plan for consolidation of the power resources of the Department in Wyoming was under study. At the same time, the Division has insisted that power from the projects in the Department be sold to the war agencies and contractors at the lowest possible rates in order that the cost of war materials and supplies produced with the power might be held to the lowest feasible level.

Members of the Division's staff advised the Secretary of the Interior upon the power problems of the Island of Puerto Rico which became acute largely due to the stringency of the oil supply on the island. In order to conserve oil and to make the utmost use of the power facilities, it became necessary that all of the facilities be completely integrated. At the request of the Territorial Government and the Federal Works Agency, the Division assisted in formulating a program for the integration of the properties of the two utility companies which served a portion of the island with those owned by the Territorial Government for the wartime welfare of the island.

Hetch Hetchy

The city and county of San Francisco submitted to the voters in November 1941 the plan for acquisition of a distribution system which the Secretary of the Interior had found would comply with the terms of the Raker Act. After the rejection of the charter amendment to put the plan into effect, a bill was introduced in Congress to relieve San Francisco of the statutory requirement to distribute solely for the public benefit the power developed through the storage of water in Yosemite National Park. Hearings were held by the Public Lands Committee of the House of Representatives at which the Department opposed any change in the conditions under which the use of national park lands had been granted by Congress. At the conclusion of the hearings, the bill was not reported out of committee.

Thereafter, largely through the efforts of the Division and in accordance with the suggestion made by the Secretary of the Interior at the hearing upon the bill to amend the Raker Act, arrangements were worked out for an aluminum reduction plant to be constructed by the Defense Plant Corporation to utilize Hetch Hetchy power in accord with the Raker Act. The Department, through the staff of the Division, and the Department of Justice then joined with the

city in petitioning the Federal District Court for a further stay of the injunction against the city, to prevent loss of revenue to it pending completion of the plant. The court granted an additional stay of 1 year, within which time all Hetch Hetchy power will be disposed of through a direct sale to the Government-owned aluminum plant.

Central Valley Project

Even with two of its generating units temporarily transferred to Grand Coulee, the Central Valley Dams will supply one of the largest single blocks of power that will become available for war production. Every effort has been made to expedite the completion of the Shasta and Keswick Dams and to secure the priorities for materials necessary to the generation of electric energy which the War Production Board has agreed is vitally needed in California. An appropriation was obtained to begin the construction of transmission lines to bring the power to load centers and for engineering work on a steam standby station which is a necessary adjunct to the project if the full benefits of the power development are to be secured for the people of the area and if power is to contribute an appropriate share to the repayment of the cost of the entire project. Comprehensive studies were under way, including studies relating to the marketing of the power and the rates at which it will be sold. Emphasis is being placed particularly on the most effective use of the power for war purposes.

General

As the clearing house for the increasing body of complicated problems incident to the power activities of the Department, the Division of Power had handled matters relating to the Park Service, the Office of Indian Affairs, the Bureau of Reclamation and the Bonneville Power Administration. All problems relating to the power projects of agencies of the Department, which are of sufficient importance to require the attention of the Secretary, have been cleared through the Division. Further steps were taken to obtain a smooth-running procedural relationship between the Office of the Secretary and the agencies of the Department dealing with power, and to establish machinery which will permit coordination of the many matters which are of concern to more than one of the agencies of the Department.

The review of applications for the use of public lands by utility companies and other power agencies was continued. A large number of contracts for the sale of power from reclamation projects was also studied and reviewed. Suggestions were made from time to time looking toward the establishment of uniform policies and practices in power sales. Further steps were taken for the effectuation of the

policy of including in contracts with distributors of power at retail, provisions relating to the rates at which the power is to be resold, the aim being to prevent excessive profits from resale of Government power in the development of which public funds and public resources have been utilized. A study of the wholesale rates for power generated on a number of projects in the Department was begun, in collaboration with the Bureau of Reclamation, to determine whether adjustments could be made in accordance with the Reclamation Project Act of 1939.

Preparations were made for the Division to appear for the several interested agencies of the Department of the Interior at a hearing before the Federal Power Commission on the application of the State of Arizona for a license to dam the Colorado River at Bridge Canyon.

At the request of the members of Congress who are sponsoring the legislation, representatives of the Division attended and participated in the hearings on the bill to establish a Columbia Power Administration to market power from the Bonneville and Grand Coulee projects. The measure would permit the administration in charge of marketing Bonneville and Grand Coulee power to acquire private utility systems in the Northwest and resell to public agencies and cooperatives the distribution properties. The generating and transmission facilities would be retained by the Federal agency and would be coordinated with the Federally constructed system. This integration of facilities would enable the area to produce an increased quantity of power now so vitally needed for war uses. The Division also participated in the work of the Department pertaining to a number of other legislative matters affecting power interests, including the proposed amendment of the Raker Act.

The Division of Power has participated in a large measure in the work of the War Resources Council of the Department which has effectively made available for use in connection with power and other natural resource development problems the advice and data of the entire Department.

Geological Survey

W. C. MENDENHALL, Director

A SUMMARY of the work of the Geological Survey during the fiscal year 1942 indicates how completely the energies of this scientific and technical unit of Government have been directed toward the paths of war. An organization that for more than 60 years has been conspicuous among comparable organizations in the world in its contributions to scientific advancement in the fields of geology, paleontology, physiography, petrography, hydrology, hydrography and the techniques of mapping, the Survey now is applying its accumulated knowledge, its trained personnel, and its developed skills to war problems.

The processes of research are the same whether they are applied to the ends of war or to those of peace. The scientist's desire is to serve mankind. He strives to extend the fields of knowledge in order that life may be richer and better ordered. But the new natural laws and products that he reveals may be seized and used by destructive as well as by constructive forces. The gangster as well as the policeman can use a gun.

Now the scientist and the technician in field and laboratory everywhere in the world are carrying on a highly important although nonspectacular part in the struggle. The Geological Survey is enlisted in this effort. Through close cooperation with other agencies of Government engaged in other phases of the same endeavor, it is reevaluating and reporting upon all of the significant deposits of deficient and critical minerals, vigorously mapping strategic areas within and without the United States and its possessions, and supplying specific information, here and abroad, on terrain, water supplies, building materials and other elements affecting use of lands for war industries or military occupancy.

Geologic Branch

The major activity of the Geologic Branch this year was in the field of minerals vitally needed for war. Owing to the great increase in

requirements and the cutting off of many foreign supplies, this field now includes all the minerals previously recognized as strategic, ores of common metals, and many minor elements that until recently had been adequately supplied. As the problems involving these natural resources have increased, the experienced and specially trained staff of the Geologic Branch increasingly concentrated on them both in the United States and other American Republics, and peacetime activities were reduced to a minimum. A new development was work in military geology, involving the preparation of special reports and maps for the armed services. The geologic programs conducted in cooperation with different States were also focused, so far as practicable, on war minerals and war problems.

War Minerals

The investigations of strategic mineral deposits were financed by an appropriation of \$245,000, of which \$35,150 was allotted to the Alaskan Branch. In addition, about \$150,000 of the appropriation for "geologic surveys" was used for strategic mineral studies in field and laboratory.

Close contact was constantly maintained between the Geological Survey and the Bureau of Mines, the War Production Board, the Reconstruction Finance Corporation, and other agencies, and many field examinations of ore deposits were made at their request. Where field conditions seemed to warrant it, recommendations were made to the Bureau of Mines for drilling or otherwise exploring certain ore deposits, and geologists were assigned to these operations to study cores and excavations and make appropriate recommendations as the work progressed.

Although iron, copper, lead, and zinc had not heretofore been included in the list of strategic minerals, the rapidly growing need for increased supplies of those metals led to the field study of a number of iron deposits and to the formulation of plans for intensive studies of all these metals during the fiscal year 1943. For this purpose increases in the staff were made toward the close of the fiscal year 1942.

Most of the iron-ore districts examined this year were in the Western States. These districts include the deposits at Canyon Creek, Ariz., Eagle Mountains, Calif., Dayton, Nev., Jones Camp, N. Mex., Scappoose district, Oreg., and Bull Valley, Utah. The geologic examinations were made in advance of and during exploration work of the Bureau of Mines. They provided basic data essential to the planning of an iron and steel industry in the West. Iron-ore deposits in northeastern Alabama and in the Cartersville district, Ga., were also examined.

A program for exploring domestic sources of aluminum developed rapidly during the year. Late in 1941 the Survey collaborated with the Bureau of Mines in a field inventory of the known reserves of bauxite, the only ore from which aluminum is now obtained. The inventory revealed a potential shortage of domestic reserves, and consequently a joint program of exploration was started in November 1941, with funds especially appropriated by Congress. The program includes, in addition to explorations for bauxite, investigations of high-alumina clays and alunite, which are potential sources of aluminum. The geologic explorations for bauxite were conducted by nine field parties in Arkansas, Alabama, Georgia, Mississippi, Tennessee, and Virginia. Four deposits recommended by the Survey were drilled by the Bureau of Mines. Field examinations of high-alumina clays were made in California, Idaho, Mississippi, South Carolina, and Washington, and of alunite deposits in several Western States. The program is to continue through 1943.

The rising demand for magnesium is expressed in the Survey work during the year in widely different ways: In the State of Washington, for example, magnesite deposits were studied and reserves estimated; in Utah, members of the Survey staff worked in shifts at a test well of the Defense Plant Corporation, seeking to appraise the magnesium and potash in cores and brines; in the Las Vegas area, Nev., a search was begun for salt, a raw material needed in large quantities at the new plant of Basic Magnesium, Inc.

The outstanding results from work on deposits of manganese in 1942 were obtained in the Batesville district, Ark. Cooperative work with the Bureau of Mines on prospecting for wad-type ores continued from 1941 until February 1942, and geologic work is still in progress. The tonnage and grade of reserves indicated by prospecting and geologic work were such as to warrant recommendations to the Metals Reserve Co. and Defense Plant Corporation for systematic large-scale development. The recommendations were accepted, a metals reserve stock pile has been established, and systematic development has begun.

Domestic chromite production made a major advance this year when a chromite concentrating plant was completed at the Benbow mine, in the Stillwater district, Mont. This mill is now producing 150 to 175 tons of chemical-grade chromite concentrates daily. It is the largest chromite mill in the country and the first of three now planned for the Stillwater deposits. The Stillwater deposits are the largest single domestic reserve of chromite and are known to contain millions of tons of ore. The explorations initiated in 1939 by the Geological Survey and later carried on jointly by it and the Bureau of Mines were largely instrumental in bringing the district into production so quickly.

A similar advance was made in the domestic tungsten industry by the initiation of large-scale production from a mine near Yellow Pine, Idaho, in which tungsten had been discovered as a result of the cooperative work of the Geological Survey and the Bureau of Mines. At the close of the fiscal year, this property was the largest single producer of tungsten concentrates in the country. Work was also carried on in other tungsten districts in Washington, Idaho, Utah, Nevada, California, Colorado, and Arizona. One of the geologists engaged in tungsten investigations perfected, during the year, a simple apparatus that permits field estimation of the molybdenum content of scheelite (calcium tungstate) concentrates, a matter of some economic importance, in that an excessive molybdenum content subjects scheelite concentrates to a price penalty.

In the larger quicksilver districts of California, Nevada, and Oregon, the detailed mapping of the districts was followed by intensive geologic studies of individual mines. Detailed district and mine examinations were also started at Terlingua, Tex., and will be continued during the coming year. Many small and widely scattered properties in the Western States were inspected by joint parties composed of a Survey geologist and a Bureau of Mines engineer. These inspections, made mainly to select the more promising localities for detailed work, also added much specific information to the records of quicksilver deposits.

Among the minor metals particularly valuable because of peculiar properties, cobalt and vanadium deserve special mention. During scientific research on manganese minerals, in which X-ray and other refined methods of study were used, it was found that some manganese ores contain cobalt in such quantities as to be possible ores of cobalt. Tests of certain cobalt-bearing manganese deposits are to continue in the coming year. For vanadium, likewise, modern technique speeded scientific search. This was especially true in the examination of several hundred titaniferous magnetite specimens from many iron deposits, which were tested by spectrographic methods at the Department of Mineralogy and Petrography of Harvard University. The vanadium-bearing phosphate rock of southeastern Idaho and western Wyoming, about which much is known through years of field study, is also being tested in a cooperative project with the Bureau of Mines. Investigations of domestic beryllium, lithium, and tantalum sources were begun in the spring of 1942 and will be combined in part with the work on strategic sheet mica.

A wide variety of nonmetallic minerals, of immediate or potential value in the war, were examined in the field and laboratory. These minerals include fluorspar in western Kentucky; graphite in Alabama, New York, and Pennsylvania; phosphates in Idaho and Wyoming;

sheet mica in New England and North Carolina; talc in California and Nevada; and topaz in South Carolina.

The diversity of the wartime geologic work is illustrated also by some of the assignments of the fuel specialists, which included studies of occurrences of oil in certain areas in and adjoining Naval Petroleum Reserve No. 1 in California; geologic conditions near Mount Pleasant, Utah, in conjunction with the drilling of a test well by the Bureau of Mines in search of coking coal; and a survey in cooperation with the Bureau of Mines of sources of helium-bearing gas. In cooperation with the Geological Survey of Pennsylvania, geophysical investigations led to the drilling of a productive oil well.

American Republics

The projects of the Geological Survey in the American Republics, which are sponsored by the Department of State, are part of a broad, long-range program designed to further the cordial relationships between the countries and to provide basic mineral data of mutual value. During this year the work was entirely on the ores of war metals: manganese and nickel in Brazil; chromite, manganese, and tungsten in Cuba; manganese in Costa Rica; antimony, manganese, and quicksilver in Honduras; and antimony, chrome, quicksilver, tin, and vanadium in Mexico. The work was directed in part toward aiding increased production.

Examinations in Brazil were typical of the broader studies that anticipate future needs. In one study the reserves of manganese ore at an extremely large, undeveloped deposit were evaluated. At another the nickel silicate ores of a deposit that is possibly the largest of its type in the Western Hemisphere were studied in detail.

The chromite project in Cuba, continued from last year, was noteworthy for the close application of scientific geology to the production problems of operating companies. One feature of the cooperative work with the companies was the application of geophysical methods to chromite prospecting. These methods offer promise of considerable success within a certain limited field.

Military Geology

Since early February, 6 to 20 geologists have been engaged in the preparation of reports and maps on the military geology of many areas, in response to requests from the Intelligence Branch of the Army Engineer Corps, Air Forces, Naval Intelligence, Board of Economic Warfare, Engineer Board at Fort Belvoir, and the Army and Navy Munitions Board. The demands on this group for strictly military geology have increased steadily.

A similar advance was made in the domestic tungsten industry by the initiation of large-scale production from a mine near Yellow Pine, Idaho, in which tungsten had been discovered as a result of the cooperative work of the Geological Survey and the Bureau of Mines. At the close of the fiscal year, this property was the largest single producer of tungsten concentrates in the country. Work was also carried on in other tungsten districts in Washington, Idaho, Utah, Nevada, California, Colorado, and Arizona. One of the geologists engaged in tungsten investigations perfected, during the year, a simple apparatus that permits field estimation of the molybdenum content of scheelite (calcium tungstate) concentrates, a matter of some economic importance, in that an excessive molybdenum content subjects scheelite concentrates to a price penalty.

In the larger quicksilver districts of California, Nevada, and Oregon, the detailed mapping of the districts was followed by intensive geologic studies of individual mines. Detailed district and mine examinations were also started at Terlingua, Tex., and will be continued during the coming year. The demands on this group for strictly military geology have increased steadily.

Alaskan Branch

What is the work of the Alaskan Branch and wherein and how during the past fiscal year has it served the national interests in these times of national need? Viewed broadly, the work is and long has been focused on determining the kinds, distribution, quantity, and characteristics of the various mineral commodities that Alaska contains which have contributed to or may contribute to the welfare of our citizens. It is no idle boast that our entire present-day civilization rests upon the availability of mineral materials from which our machines may be made, our structures built, and our system of life supported. Indeed, even the other basic industries, such as agriculture, depend in large measure on the mineral composition of the soils, the physical configuration of the terrain, and the supplies of that most indispensable of all minerals—water. Without the mineral products the cultivation, garnering, and marketing of the crops would come to an almost complete standstill. Realizing how requisite minerals are at all times in our normal activities, it is readily evident that now with the safety and even the perpetuation of our country at stake the needed supplies of minerals have become indispensable for protecting the Nation and waging war successfully.

Obviously, specific answers to questions as to the kind and quantity of mineral commodities that Alaska contains require intensive examinations in the field of the various areas by geologists. These scientists through long and detailed training and experience in developed areas where like minerals occur have become skilled so that they can recognize and interpret those elusive features that furnish the bases from which dependable judgments can be drawn as to the worth of deposits that have not yet been developed. Before reaching their conclusions, however, the geologists must avail themselves of such office and laboratory tests as will check and make definite their field observations. This may call for extensive microscopic examinations of the specimens collected, assays, and chemical analyses of the carefully taken samples, library research and consultations with specialists, and recalculation and review of the mass of field notes and measurements that have been made. Finally, the explanation of the findings must be set down in carefully prepared written reports, which will hand on to others the significant results of the investigations and thus stimulate development of the deposits that appear to merit it or discourage wasting time and money on those that seem to have little present merit.

Necessarily, these mineral investigations are not limited and should not be restricted to the determination of the mere mineral content of the deposits examined, because many other geologic and topographic factors play important roles in determining whether or not a certain

deposit may be of value. To supply part of the information needed in the consideration of these broader aspects, the examinations include the making of topographic maps to show the situation of the area discussed with respect to all its natural surroundings. From these maps may be read the distances to all points within the area, the height of all land and water features both with respect to sea level and to each other, and relations to routes and means of communication and transportation. Indeed the uses of these maps are so diverse that they are relied on in all lines of governmental and private enterprise, whether or not even remotely concerned with mining. In other words, they are the authoritative maps of the land areas of the Territory and are in demand by road makers, aviation companies, settlers, travelers, industrialists, and specialists of all kinds concerned with Alaskan problems.

During recent years, with the menace of war looming ever more threateningly ahead and finally with the actual outbreak of war, the activities of the Alaskan Branch have become increasingly directed toward supplying information of most current significance. Thus its studies of minerals have been centered more and more closely on search for those that are urgently needed in the war industries. Tin, nickel, chrome, tungsten, antimony, and mercury are among those of which domestic supplies are not available in sufficient quantities to make all the needed tanks, airplanes, bombs, guns, and the myriad of other tools of war, and consequently are the materials for which most diligent search is being made by the Survey's Alaskan geologists. In part that work has been financed through appropriations made by Congress direct to the Geological Survey. In addition, recognition of the need of expediting that search has led the War Production Board to transfer certain of its funds to the Geological Survey, so that additional projects could be undertaken.

The need for more adequate and special maps of Alaska for military purposes, especially those used in aerial navigation, has become increasingly urgent. As a result, the Army Air Forces during the past year arranged to utilize extensively the services of the personnel of the Alaskan Branch in compiling maps of Alaska and other areas. The long and specialized experience gained by Alaskan topographers in quickly and economically mapping large tracts of country by either ground surveys or aerial photographic methods made the Air Forces' selection of this group an especially fitting choice. By this selection a nucleus of skilled engineers was readily at hand to start immediate production, to devise methods and instruments to facilitate the work, and to acquire and train the personnel needed to prepare whatever maps the Air Forces may call on the Geological Survey to compile. At the end of the fiscal year 1942 more than 150 persons were employed on this special work for the Air Forces, and requests on file from

the War Department indicated that the Survey should recruit two or three times that number as rapidly as practicable.

Owing to the strong seasonal control exercised by the weather and other conditions on the field projects undertaken by the Geological Survey in Alaska, description of the various undertakings cannot well be limited to a single fiscal or calendar year. A start on most of the projects is made in March or April, when plans are set in motion. The field work generally begins in May and continues through September, or as late as the weather permits, and is then followed by office and laboratory work during the following winter and spring. This condition is so fully recognized that the regular appropriations for investigations of Alaska mineral resources usually are not limited to a single fiscal year but become immediately available on the passage of the annual appropriation act and continue to be available throughout the next fiscal year. It is therefore convenient to refer the various projects undertaken by the Alaskan Branch to the "season" in which the field work was done. Thus the season of 1941 may have started in May 1941 and continued well into 1942, though part of the work up to June 30, 1941, may have been paid for from funds for the fiscal year 1941 and part prior to that date, and all subsequent to that date may have been paid for from funds for the fiscal year 1942.

Season of 1941.—During the season of 1941 the Alaskan Branch engaged in 17 projects which involved field work and 2 projects which, though based on field records, involved only office and laboratory work by members of its staff. Of the field projects 12 were primarily for the study of mineral resources, 4 were for topographic mapping, and 1 was for general administrative purposes and the planning of future work. Of the geologic or mineral resources projects 3 examinations related to chrome deposits, 2 to nickel, 2 to tin, 1 to mercury, and 1 to antimony. Two of the projects, 1 in southeastern Alaska and 1 in the Alaska Range, though directed toward general regional examination, included incidental preliminary studies of certain other deposits of antimony, tungsten, nickel, molybdenum, and iron. A general geological reconnaissance was made of the Porcupine River Valley in east-central Alaska.

The four topographic mapping projects involving field work were reconnaissance surveys in the Yentna district, aerial photography in the Yukon-Kuskokwim region, and detailed surveys in the Hot Springs district and at two localities in the vicinity of Tanana.

Although not involving field work by members of the Alaskan Branch, the compilation of aeronautical piloting maps from photographs furnished by the Army Air Forces and largely paid for from funds it transferred to the Survey became the principal office activity of the branch during the season of 1941 and is being continued at an accelerated rate and with a largely increased force. Another office

ask that is carried on uninterruptedly by the branch is the collection of statistics regarding the output of all mineral products from Alaskan deposits.

Season of 1942.—With the funds appropriated directly to the Geological Survey 14 field projects were gotten under way in the early part of the season of 1942. This number, however, was too small to permit undertaking all the examinations that were needed, and consequently in June the War Production Board made funds available to undertake 15 additional field projects. Although progress was made in recruiting personnel, getting equipment, and organizing these additional parties, none of them were actually in the field during the fiscal year 1942, and therefore these additional projects are not being described here further than to note that all of them related to the search for deposits of strategic and critical minerals. Of the original field projects 12 related directly to mineral resources and 2 primarily to topographic mapping. The 2 topographic projects that involved field work by the staff were reconnaissance surveys of parts of the Yukon and Kuskokwim Valleys that heretofore had not been adequately mapped. Both of these projects, besides contributing general information as to the parts of Alaska covered and being of special value in the compilation of military maps now in progress in the branch, were so planned as to fit into the Survey's regular program of mineral resources investigations that will be undertaken in the near future.

In addition to these projects involving field work in Alaska by members of its staff, the Alaskan Branch has continued in the office the compilation of maps needed by the Army Air Force for its series of aeronautical charts. This work is being carried on at a constantly accelerated rate, so that ultimately it will probably utilize the services of between 400 and 500 persons. It is therefore one of the largest activities of the branch at this time.

Reports and maps.—During the year 5 reports with maps and 1 report without maps, 3 new maps, reprints of 9 maps, and 8 press statements have been published; 10 reports containing maps and a reprint of 1 map are in course of publication; 9 reports and 1 new map are in course of preparation; and 2 reports prepared by the personnel of the Alaskan Branch were approved for outside publication.

Topographic Branch

The headquarters offices of the Topographic Branch and of its Atlantic Division are located at Washington; the headquarters office of the Pacific Division is at Sacramento, Calif.; and that of the Central Division at Rolla, Mo. Section offices were maintained at Denver, Colo., Chattanooga, Tenn., and Clarendon, Va.

General Office Work

Necessary office work incidental to the field work of the Topographic Branch consisted of the computation and adjustment of the results of control surveys, photoplanimetric compilation, and the inking, inspection, and editing of topographic maps prior to their submission for reproduction.

Section of Computing.—The volume of work connected with routine processes of computing, tabulating, and distributing the results of new control surveys was greatly increased during the year, because such surveys were accelerated in the field to meet the requirements of the large military mapping program. Activity was also intensified in reducing to current standard datum many older surveys, which could in this way be made useful to that program.

Manuscripts for three of the four parts of a bulletin that will contain the results of spirit leveling in Illinois were prepared and transmitted for publication. Bulletins 883-D and 883-E, Spirit leveling in Texas, the fourth and fifth of seven parts, were published during the year.

Section of Photomapping.—In addition to the Washington office this section maintains offices in Chattanooga, Tenn., and Clarendon, Va. Photomapping was also carried on in Rolla, Mo., and in Sacramento, Calif., under the immediate direction of the engineers in charge of the Central and Pacific Divisions.

Work in the Washington office consisted principally of the preparation of planimetric maps for use in the Central Division, the preparation of contracts for aerial photography, and the purchase of photographs from other agencies or companies. Thirty-two Geological Survey employees in the Chattanooga, Tenn., office were engaged in the preparation of planimetric and topographic maps of the Tennessee River Basin and of the State of New York, the latter being a project in which the War Department and the Tennessee Valley Authority are cooperating with the Geological Survey. Under this cooperation 834 square miles of topography were mapped in the State of New York.

The Clarendon, Va., office, which was established during this fiscal year, was engaged in the preparation of planimetric bases for topography and topographic maps of considerable areas in the Atlantic Division. Several special maps of areas in Western States were made for the Geologic Branch for use in studies of strategic and critical minerals. All work in the Clarendon and Chattanooga offices was done with either multiplex or aerocartograph photogrammetric instruments, but radial line methods only were employed in the Washington office.

Section of Cartography.—Work on the United States part of the map of the world on the scale of 1:1,000,000 was continued. Sheet N K-16,

Chicago, was lettered, edited, and transmitted for publication. The compilation and inking of sheets N K-17, Lake Erie, and N I-18, Hatteras, were in progress.

For the Public Roads Administration the preparation of the Transportation Map of the United States was continued. Compilation, inking, and lettering were in progress on 56 sheets. Proofreading and checking were completed on 24 sheets. Maps of 2 States, comprising 24 sheets, were published, and maps of 1 State, comprising 12 sheets, were in course of publication. Miscellaneous jobs were done for the War Department during the year.

Section of Inspection and Editing.—During the year 15 new topographic maps were prepared for photolithography as two-color advance sheets and 55 as planimetric maps; 186 new topographic maps were edited for publication, 104 of which were for multicolor lithography and 82 for engraving; 195 quadrangle maps, 4 State maps, and 3 State index maps were prepared and edited for reprint editions and corrections; and 29 maps were edited before furnishing prints for reproduction by outside contractors. Editing was also completed on 205 maps published as illustrations, making a total of 622 maps edited. Four hundred and ninety-three proofs of all types were read. On June 30, maps in the process of reproduction included 122 for engraving, 77 for multicolor lithography, and 26 planimetric maps. Maps being edited or awaiting editing included 80 maps for engraving and 129 for multicolor lithography. In Clarendon, Va., a drafting force was maintained for the drafting of Atlantic Division maps.

Map Information Office

The Map Information Office continued its work as an intradepartmental clearing agency for map and aerial photographic data pertaining to both Federal and commercial agencies. This office maintains extensive card index and map files and is equipped to furnish data to Federal and State institutions and to an interested public.

Field Surveys

Work was carried on in 38 States, in the District of Columbia, and in Puerto Rico. Cooperative projects were conducted in 17 of these States, in Puerto Rico, and with the Tennessee Valley Authority. Ninety-nine 15-minute and 133 7½-minute quadrangles were completed, and work was in progress on 72 15-minute and 84 7½-minute quadrangles. Of the completed quadrangles, 86 were mapped for the United States Army, and of those in progress 64 were for the same organization. Surveys of two special depots were completed for the Navy Department. Work on 7 special maps for the geologic

¹ Planimetric maps, not included in total surveys, were compiled from aerial photographs with field examination—Georgia, 140; Idaho, 62; Kansas, 341; Louisiana, 563; and Wisconsin, 2,106.

² Contour interval in meters.

investigation of strategic minerals was completed and work on 2 continued. The survey of the Dinosaur National Monument, Colorado-Utah, was completed. Twenty-seven 7½-minute and twenty-two 15-minute planimetric maps were also completed. Revision of the map of Washington and vicinity was 99 percent completed.

Of the total area of the United States, 46.7 percent has been covered by topographic maps prepared by the Geological Survey.

Water Resources Branch

The Geological Survey collects and publishes data on the quantity, chemical quality, and availability of the water resources of the United States. These data are prerequisite to the location and operation of military establishments and war industries and to the orderly and efficient development of domestic, municipal, and industrial water supplies. They are also essential for assuring the success of irrigation, power, navigation, flood-protection, and pollution-control works.

Funds aggregating nearly \$3,000,000 were available for water-resources investigations during the fiscal year 1942. Of that amount, about 40 percent was appropriated by Congress, about 35 percent was contributed by States and municipalities, and about 25 percent was transferred or reimbursed by other Federal agencies.

Cooperation With States and Municipalities

The appropriation by Congress for water work during the fiscal year 1942 was \$1,285,500. Of that appropriation, \$1,000,000 was restricted for use in cooperation with States and municipalities, and these cooperative agencies contributed essentially the same amount, as summarized below.

State	Contri- bution	State	Contri- bution	State	Contri- bution
Alabama.....	\$10,000	Maryland.....	\$7,925	Oklahoma.....	\$18,812

Activities Carried on for Other Federal Agencies

Other Federal agencies have provided about \$670,000 for water-resources investigations that could not be financed by appropriated funds of the Survey or included in cooperative projects. These agencies are: Office of the Chief of Engineers, Office of the Quartermaster General, and the Mississippi River Commission, War Department; Bureau of Yards and Docks and Coast Guard, Navy Department; Bureau of Prisons, Department of Justice; Tennessee Valley Authority; Flood Control Coordinating Committee, Department of Agriculture; Weather Bureau, Department of Commerce; Bureau of Reclamation, Fish and Wildlife Service, Grazing Service, National Park Service, Office of Indian Affairs, and Office of Land Utilization, Department of the Interior; Department of State; Federal Power Commission; and National Resources Planning Board.

Review of the Year's Accomplishments

The Geological Survey's operations related to water are grouped under five administrative divisions of the Water Resources Branch: Surface water, ground water, quality of water, utilization of water, and power resources.

Records of the stages, quantity, or availability of surface waters are collected at about 5,000 gaging stations, of which nearly 3,800 are equipped with water-stage recorders, distributed through every State and the Territory of Hawaii—sparsely in some States and increasing in number as the cooperative funds increase. The field records are analyzed, studied, and published. They become the basis for development projects and for the control and distribution of water for municipal, industrial, and irrigation uses and for the protection of health, the operation of inland waterways, and similar activities.

Surface-water investigations were conducted in cooperation with 140 State and municipal agencies. The field personnel for this work operates from 45 principal field offices. The program of construction, operation, and maintenance of gaging stations in connection with the flood-control investigations and maintenance and improvement of river and harbor works of the Corps of Engineers, War Department, was continued. Cooperative stream-flow investigations in connection with irrigation systems, land-use studies, water-power developments, and other activities were continued with other Federal agencies.

The studies of ground water relate to the waters that lie within the zone of saturation, from which wells and springs are supplied; the source, occurrence, quantity, and head of these waters; their conservation and natural and artificial replenishment; their availability and adequacy for domestic, industrial, irrigation, and public supplies

and as sources of water for livestock and desert travelers; and methods of constructing wells and recovering water from them and of improving springs. The increasing use of water from wells is causing a great demand for intensive studies of the quantities of ground water that are perennially available.

Ground-water work, conducted through 25 field offices, was done in nearly every State. In 32 States and in Hawaii it was accomplished in cooperation with the State Geological Surveys or other State and municipal agencies. Periodic measurements of water levels or artesian pressures were made in about 7,100 observation wells, 312 of which were equipped with recording gages.

Chemical analyses of 2,201 samples of water were made in Washington, and analyses of 7,114 samples were made in field laboratories. Studies were continued on the chemical character of surface waters in cooperation with four States, and analyses of water were made in connection with cooperative studies of ground water in other States.

In addition to work for war agencies, interpretations of analyses or advice about water problems were furnished for 17 bureaus in 6 Federal departments and for 7 independent Government agencies.

A variety of hydrologic and hydraulic studies and compilations are made on the utilization and control of streams, and a monthly summary is issued of stream-flow conditions throughout the country as indicated by reports received from the field engineers. These summaries are used by major war agencies in administering production in which water excesses, as in floods, or shortages, as in droughts, are vital. The administration of certain responsibilities relating to permits and licenses of the Federal Power Commission has been continued. Because of the importance of power in the war program this function is increasingly essential. Investigations of water problems along the international boundary between the United States and Canada have been continued for the State Department and the International Joint Commission. Among the important problems studied have been the international aspects of storage above the Grand Coulee Dam and in Kootenai Lake, both of which have great importance in the production of power for war.

With the aid of various Federal agencies a report, by countries, of the amount of developed and potential water power of the world has been compiled and published. This report showed that the total potential water power, based on ordinary minimum flow, was 672,000,000 horsepower and that the total capacity of water-power plants of the world was 71,600,000 horsepower on January 1, 1942. Of the developed power, about 27 percent is in the United States, 12 percent in Canada, 9 percent each in Italy and Japan, and lesser amounts in other countries.

War Service

Reports and consulting services have been furnished on the quantity and quality of both surface- and ground-water supplies for war purposes at about 1,700 places in the United States and in certain islands of strategic importance, as requested by the War and Navy Departments, the War Production Board, and other war agencies. These reports and services were made available in part on the basis of information collected in previous years and in part on the results of special investigations made in regions where such information was meager or the possible deficiencies in quantity or the doubtful quality of water appeared to be most threatening. Trained personnel stationed at 75 field offices throughout the country were utilized for such special field investigations, which related to the water supplies for Army cantonments, naval stations, munitions plants, largely increased local concentrations of population producing war supplies, and for other war activities. Because of the danger of local depletions of ground water by heavy pumping for war purposes, regional surveys were undertaken to determine total pumpage, water-level fluctuations, and possible salt-water encroachment in critical areas. Surveys were also made for the Navy Department of emergency supplies from wells in case of attack.

Day-by-day records of water are essential not only to the social and economic development of the Nation but also to the development and operation of the war program. Private and public power developments, such as the Bonneville, Boulder, and Tennessee Valley Authority systems, are furnished with basic data on available water supplies required currently for operation of the plants and for planning the expansions that may be made necessary by the rapidly increasing demand for electric power.

Summaries of water conditions, both on the surface and underground, throughout the United States were prepared each month for the use of the agencies in charge of water-supply and power activities related to the war. Collaboration with the Dominion Water and Power Bureau of Canada enables both the United States and Canada to benefit from a knowledge of conditions brought up to date each month. The Water Resources Branch has furnished information on water supplies in many foreign countries to the War and Navy Departments. It also has furnished information on present and potential power resources requested by those Federal and allied agencies directly concerned with power production.

The Water Resources Branch through the facilities of its Nation-wide distribution of personnel served the War Production Board by making a survey of the use of pig iron at about 2,400 foundries.

Thus, the reservoir of information contained in the published and

unpublished records related to the water resources of the Nation, the facilities and information made available by cooperation with many States and municipalities, and the asset represented by hundreds of engineers, geologists, and chemists experienced in work on water have been made of maximum value in the war.

Conservation Branch

The normal work of the Conservation Branch consists of the making of surveys and investigations of the water and mineral resources of the public domain; the supervision of operations incident to the development of power and the production of minerals from public lands, Indian lands, and naval petroleum reserves; and the furnishing of technical decisions and information to Government agencies engaged in administering the public-land laws. In time of war these continuing functions of government undergo little change in basic character but are materially intensified and accelerated by the necessity of meeting the imperative need of the Nation for increased supplies of power and raw materials. At such time the whereabouts, worth, and accessibility of the mineral and water-power resources under Federal control—questions answered by adequate land classification—become overnight matters of grave national concern; and the competent prospecting and efficient development of Government-controlled sources of mineral fuels, metals, fertilizers, and industrial chemicals—the result of adequate mineral-lease supervision—become vital elements of national survival.

Since December 7, 1941, both of these primary phases of Conservation Branch work—land classification and mineral-lease supervision—have been intensified and, wherever possible, so redirected as to lend increased support to the national objectives of winning the war and of perpetuating the best in the American way of life.

Classification of Lands

Mineral classification.—As consultant in geology to Federal agencies, primarily bureaus and offices of the Interior Department charged with the administration of laws governing Federal and Indian lands, the Mineral Classification Division continued in 1942 its indispensable work of supplying the geologic findings and decisions that are prerequisite to the grant or transfer of prospecting and development rights in such lands under the mineral-leasing laws, to the approval of unitization agreements for oil and gas holdings and of participating areas thereunder, to the occupancy of such lands for right-of-way purposes, and to the outright disposal of such lands under the nonmineral land laws. In all, 7,355 cases involving from 1 to 50 geologic decisions

each were acted on during the year. Additional office work included the preparation and promulgation of definitions or redefinitions of the known geologic structure of 17 producing oil and gas fields, the net area so defined in nine public-land States being increased to 1,686,950 acres at the end of the fiscal year.

In aid of mineral classification geologic surveys were made of coal, petroleum, and potash occurrences in Wyoming, Kansas, and New Mexico and of geologic conditions at one dam site in Washington.

Water and power classification.—The work of obtaining basic information concerning the water-power resources and storage possibilities of Federal lands and of making such information available for use in the administration of the public-land laws was continued throughout 1942. Office activity resulted in the addition of 19,618 acres to power-site reserves and the elimination of 22,720 acres therefrom, with net reduction of the outstanding reserves in 22 States and Alaska to 6,615,746 acres; in the publication in mimeographed form of 6 preliminary reports on stream utilization; and in final action involving hydraulic determinations on 228 cases received for report from departmental sources and the Federal Power Commission. Reservoir-site reserves in 9 States remained unchanged, at 137,172 acres.

In the field, topographic surveys were made of 68 linear miles of stream valley, of 9 dam sites, and of 1 mineral leasehold, and, in cooperation with the Water Resources Branch, supervision of construction and operation was given to 160 power projects under license from the Federal Power Commission and to 136 such projects under permit or grant from the Department of the Interior. For want of funds the division office at Sacramento, Calif., was discontinued during the year.

Mineral Lease Supervision

Mine supervision.—Through the Mining Division, inspectional, regulatory, and accountancy supervision is exercised over operations for the discovery and production of coal, potassium, sodium, phosphate, oil shale, and sulfur in public lands; of gold, silver, and mercury in certain land grants; and of all metalliferous and nonmetalliferous minerals except oil and gas in tribal and restricted-allotted Indian lands. The work is done from seven field offices in the West and Southwest, and on June 30, 1942, it involved 696 public-land properties under lease, license, and prospecting permit in 15 States and Alaska and 313 Indian properties under lease and permit in 14 States.

In the field of mine supervision the effects of war on industrial activity throughout the country, on transportation, and on the fuel-consuming habits of the American people were beginning to be ap-

arent before the end of the fiscal year 1942. The production of coal, potassium salts, and phosphate rock from public lands in 1942 was substantially greater than in 1941, and the accrued revenues were correspondingly increased. Additional properties were coming to production at the end of the fiscal year, and an unusual amount of prospecting was under way on public lands, particularly for coking coal suitable for metallurgical uses, for magnesium-rich brines, and for vanadium-rich phosphate rock.

On Indian lands, mining activity was responsive to the same economic forces and resulted during the year in a large increase in the production of lead and zinc, in a substantial increase in the production of coal, and in extensive prospecting of such lands with a view to the early development of deposits of vanadium, tungsten, magnesium, copper, and chromium known to occur therein.

Information and assistance on war-engendered problems involving the occurrence of coal and of numerous other minerals, both metalliferous and nonmetalliferous, in various parts of the United States and its possessions were provided by the engineers of the division both in Washington and in the field to numerous individuals contemplating development and to representatives of many State and Federal agencies.

Oil and gas supervision.—Through the Oil- and Gas-leasing Division supervision analogous to that of the Mining Division is exercised over operations for the discovery and production of petroleum, natural gas, natural gasoline, and butane occurring in public lands of the United States, in naval petroleum reserves, and in all Indian lands subject to departmental jurisdiction, both tribal and allotted, except those of the Osage Nation, Oklahoma. During the fiscal year 1942 the inspectional, regulatory, and accountancy duties of supervision were discharged through 16 field offices and suboffices in California, New Mexico, Oklahoma, Colorado, Wyoming, Montana, and Utah.

Because of the vital importance of petroleum, its fluid associates, and its derivatives to industry, transportation, and all phases of warfare, the transition of the Nation from a defense basis to an all-out war basis during the year increased vastly the duties and responsibilities of oil and gas leasehold supervision. Necessary and far-reaching controls imposed by the Government on oil and gas production and particularly on the multifarious uses of steel throughout the petroleum industry entailed extensive revisions and modifications of drilling programs affecting leaseholds under the jurisdiction of the division, increased vigilance in safeguarding the conservational and pecuniary interests of the lessors involved, and caused unprecedented use of the informational and consultive facilities of the division by lessees, operators, State agencies, and Federal officials.

On public lands the number of properties under supervision at the

end of the fiscal year aggregated 4,465 and involved 3,513,125 acres in 20 States and Alaska. Drilling on such lands during the year included the spudding of 414 wells and the completion of 460 wells, 346 of which were productive of oil or gas and 114 of which were barren. In all, 10,154 public land wells, including 5,327 capable of oil and gas production, were under supervision on June 30, 1942. The production of petroleum, natural gas, natural gasoline, and butane from public lands in 1942 was substantially greater than in 1941.

During the year 5 new plans of unit operation involving public lands were approved and 5 were canceled, leaving 117 approved plans, involving 1,862,860 acres, outstanding on June 30, 1942. Production under approved unit agreements constituted about 45 percent of the petroleum, 55 percent of the natural gas, and 65 percent of the gasoline and butane obtained from public lands in the fiscal year.

On Indian lands the work of oil and gas lease supervision involved 4,281 leaseholds in 8 States containing, at the end of the year, a total of 7,875 wells, 4,176 of which were productive of oil or gas, and 213 of which had been completed during the year. Production from such leaseholds was substantially greater than in the preceding year, notably from Kiowa lands in Oklahoma, Blackfeet lands in Montana, and Shoshone lands in Wyoming, and revenues accrued therefrom as royalty, rental, and bonus are estimated to be in excess of \$2,600,000.

On behalf of the Navy Department supervision was continued in 1942 over operations for the production of oil, gas, gasoline, and butane from 22 properties under lease in Naval Petroleum Reserves Nos. 1 and 2 in California and for the conservation of shut-in production in Reserve No. 3 in Wyoming. Production from 294 active wells on Reserves Nos. 1 and 2 aggregated 2,753,877 barrels of petroleum, 1,931,786,000 cubic feet of natural gas, and 8,918,047 gallons of natural gasoline and butane, having an aggregate royalty value of \$633,603.64.

Public Works projects.—During the fiscal year 1942 expenditures of \$5,014.39 were made from funds allotted by the Public Works Administration in the plugging or conditioning, under the supervision of personnel of the Oil- and Gas-leasing Division, of wells for which no bonded liability for proper abandonment exists.

Work on Publications

Texts.—The book publications of the year numbered 69 in the regular series and 20 pamphlets and circulars for administrative use. The total number of pages was 7,295. Besides these printed publications 53 brief papers were issued in mimeographed form as memoranda for the press.

Illustrations.—The illustrations prepared consisted of 684 drawings and photographs. One thousand and fourteen illustrations to accompany 64 reports were transmitted to the printer, and 687 proofs and 57 edition prints were examined.

Geologic map editing and drafting.—Most of the 107 maps and illustrations prepared by the section were related directly to investigations of mineral deposits essential to the war effort. Some of these were intended for publication in reports of the Geological Survey; others were sent direct to the War Production Board or other war agencies. Work was continued on the reconnaissance map of southern New Mexico. Maps and illustrations for 64 reports were edited, and proofs of 60 geologic maps and sections for 29 reports were read.

Distribution.—A total of 742 publications, comprising 68 new books and pamphlets, 102 new or revised topographic and other maps, 1 geologic folio, 39 Tennessee Valley Authority maps with contours, 16 reprinted topographic and other maps, 184 new advance sheets, and 22 reprinted advance sheets were received during the year. The total units of all publications received numbered 125,670 books and pamphlets, 1,410,317 topographic and other maps, and 4,570 geologic folios, a grand total of 1,540,557. The division distributed 102,124 books and pamphlets, 1,972 geologic folios, and 1,490,140 maps, a grand total of 1,594,236, of which 1,570 folios and 1,352,823 maps were sold. The net proceeds (gross collections less copying fees and amounts refunded) from the sales of publications were \$37,200.64, including \$36,842.92 for topographic and geologic maps and \$357.72 for geologic folios. In addition to this, \$52,686.52 was repaid by other agencies of the Federal Government at whose request maps or folios were furnished. The total net receipts, therefore, were \$89,887.16.

Engraving and printing.—During the year 13 special maps and 89 newly engraved topographic maps, 6 of which were revised maps, were printed, making a total of 102 new maps printed and delivered. Reprint editions of 309 engraved topographic maps and 17 photolithographed State and other maps were printed and delivered. Of new and reprinted maps, 428 different editions, amounting to 1,149,557 copies, were delivered. One geologic folio amounting to 4,570 copies was delivered. Printed small sale editions of 57 planimetric, 17 advance photolithographed, and 126 multicolor photolithographed topographic maps, totaling 247,155 copies, were printed from plates previously made for official purposes. A large amount of work was done for 80 other units of the Government, including branches of the Geological Survey, and the charges for it amounted to about \$220,000, for which the appropriation for engraving and printing geologic and topographic maps was reimbursed. Transfer impressions and velox

Engraving and printing.—During the year 13 special maps and 89 newly engraved topographic maps, 6 of which were revised maps, were printed, making a total of 102 new maps printed and delivered. Reprint editions of 309 engraved topographic maps and 17 photolithographed State and other maps were printed and delivered. Of new and reprinted maps, 428 different editions, amounting to 1,149,957 copies, were delivered. One geologic folio amounting to 4,570 copies was delivered. Printed small sale editions of 57 planimetric, 17 advance photolithographed, and 126 multicolor photolithographed topographic maps, totaling 247,155 copies, were printed from plates previously made for official purposes. A large amount of work was done for 80 other units of the Government, including branches of the Geological Survey, and the charges for it amounted to about \$220,000, for which the appropriation for engraving and printing geologic and topographic maps was reimbursed. Transfer impressions and velox

prints, numbering 276, were made during the year, and the amount turned over to miscellaneous receipts was \$547.86. Topographic maps and contract and miscellaneous work of all kinds, totaling 2,623,379 copies, were printed and delivered. The photographic laboratory made 10,517 negatives, 27,435 prints, and 3,075 photolith press plates, 285 intaglio etchings, and 8 celluloid transfers, and mounted 218 prints.

Library

In the work being done for the armed forces the library is rendering essential service, not only to its own bureau but also to the War and Navy Departments and to the various planning and production agencies, both by loans of material and by service to research workers. Because of war conditions the new material received has decreased, the number of books and pamphlets received during the year being only 12,735. The number of readers jumped to 11,291, an increase of nearly 4,000 over the previous year. Nearly 56,000 pieces of material were circulated, an increase of more than 50 percent within the Survey and 80 percent in interlibrary loans.

Field Equipment

The Division of Field Equipment designs, constructs, and repairs instruments used by the several branches of the Geological Survey in their war activities, in addition to its work as custodian of the various surveying, geologic, meteorologic, and hydrologic instruments used in the field by those branches. The Division's greatest contribution toward winning the war lay in the assistance given to the Alaskan Branch in the design and construction of numerous mechanical devices that have greatly accelerated the production of maps in connection with the mapping program for the Air Corps. The most important of those devices are the Lewis rectoblique plotter, the Sketchmaster, and the Lucidagraph. Development work is in progress on several new devices, such as a double photoalidade and a stereoblique plotter. By means of instruments of this type, aerial photographs taken at an angle of approximately 30° below the horizon may be converted to maps such as are required for the navigation of air forces over previously unmapped or inadequately mapped areas. The reconditioning of between 50 and 100 outmoded plane-table alidades for field use by the Topographic Branch in mapping strategic areas is another outstanding contribution of the division. These alidades, although practically discarded during previous years because of newer improvements, proved to be a valuable resource when the manufacturers of such instruments became so busy on War and Navy contracts that deliveries on new equipment became long-delayed or impossible to obtain.

Funds

During the fiscal year 1942 there was available for expenditure under the direction of the Geological Survey a total of \$9,362,809. Of this amount, \$4,997,880 was appropriated directly to the Geological Survey, and \$4,364,929 was made available by other Federal agencies and by States and their political subdivisions. In addition, \$9,800 was allotted from the appropriation for contingent expenses of the Department of the Interior for miscellaneous supplies.

Bureau of Mines

R. R. SAYERS, Director

Foreword

GUIDED by more than three decades of experience in the conservation and development of mineral resources, the Bureau of Mines quickly and efficiently completed the conversion of its activities to the national-defense program by the beginning of the 1942 fiscal year, and when hostilities began in December 1941, the Bureau adjusted all its widespread operations to a full war basis.

Many valuable contributions to the war program were recorded by the Bureau of Mines during the fiscal year. Engineers and technologists explored domestic mineral deposits throughout the United States and in Alaska, and revealed several hitherto unknown reserves of strategic, critical, and essential ores; metallurgists presented the country with new and improved methods for beneficiating low-grade domestic ores and thus developed additional means for obtaining some of the metals vitally needed for guns, ships, planes, and tanks; petroleum and gas engineers increased by many times the output of helium at the Government-owned plant; solid-fuels chemists developed further the knowledge of domestic coking coals; health and safety experts concentrated on conserving skilled manpower for war industries; and mineral economists and statisticians collected and interpreted data on the production, consumption, and uses of minerals and helped guide the Federal war agencies and private war industries in essential planning for prosecution of the war.

Former dependence upon imports for many critical and strategic minerals and the necessity for a quicker change to utilization of the domestic low-grade ores, which was created partly by American shipping losses, brought the exploratory and metallurgical work of the Bureau into sharp focus during the 1942 fiscal year. The Bureau's mining engineers made known important additional reserves of chromite, manganese, mercury, tungsten, iron ore, bauxite, and alumina clay. As a result of this work, the estimated reserves of chromite alone were increased about 2,300,000 tons, and production was begun in three areas; there were two important discoveries of high-

grade mercury and five significant findings of tungsten; the reserves of manganese ore of milling grade were increased at least 1,100 tons; more than 1,000,000 tons of usable bauxite were found; drilling at five clay projects indicated 4,600,000 tons that contain 35 percent alumina. Altogether, 740 deposits of strategic ores were examined and rated as to relative importance.

To utilize to the fullest extent both the newly found ores and other known low-grade domestic deposits, the Bureau's metallurgists and chemists labored in the 1942 fiscal year to develop and perfect new treatment processes and to improve old ones. Laboratory investigations and pilot-plant tests showed that substantial amounts of manganese, chromium, magnesium, and aluminum could be made available. Methods also were developed for treating ores containing aluminum, cobalt, and magnesium, and laboratory work was continued on the beneficiation of ores containing antimony, copper, mercury, nickel, tungsten, zinc, and fluor spar. A number of suggestions for increasing domestic production were submitted to war-production agencies. Because of the importance of manganese in steel-making, considerable attention was given to developing vast low-grade reserves of this metal. Through its network of laboratories and pilot plants, the Bureau expanded and intensified its work in ore dressing, ore concentration, hydrometallurgy, electrometallurgy, and pyrometallurgy.

Proportionate attention was directed toward the development and use of many of the important nonmetals, such as graphite, kyanite, talc, glass sand, and forsterite. A shortage of flake graphite for crucible and steel-ladle stoppers was foreseen during the fall of 1941 and in consequence of the Bureau's experiments on graphite from domestic deposits, the War Production Board made arrangements to operate five mills. Substitutes were found for Indian kyanite. Sample talcs were tested to find ceramic talc suitable for radio insulators; some West coast sands were found to be usable, with treatment, as substitutes for imported glass sands; and deposits of volcanic rocks of a certain type were found to be good substitutes for magnesite bricks.

The Bureau's technologic work on solid fuels included the analysis and testing of coal samples from all parts of the United States; advising the Government in the purchase of coal; exploring for western coal deposits and testing these coals to find those suitable for use to be used in the steel industry of that region; making gasoline from coal; devising a new method of extinguishing magnesium incendiary fires in industrial plants; and treating and conditioning boiler water. More than 15,000 coal analyses were made. New blast furnaces in the West and a lack of coking coal led the Bureau to analyze numerous western coals; as a result, it was found that certain coals could meet needs for coking coal in the West.

In response to the increasing demand for high-octane gasoline to run the engines of the United Nations' fighting planes throughout the world, the Bureau examined the aviation-gasoline stock of 200 crude oils and the products of 25 condensate plants. It also made a series of tests on the blending of high-octane gasoline and studies of the available reserves. The Bureau opened a new petroleum field office at Franklin, Pa.

An outstanding accomplishment last year was the promptness with which the Bureau increased helium production at its plant in Texas to supply greatly increased demands for this lightweight, noninflammable gas to fill submarine-patrol dirigibles, Army blimps and balloons, meteorological balloons, and barrage balloons, and for other military and essential civilian uses. Helium production in 1942 was higher than at any time in the 13-year history of the Government plant, as output actually exceeded the rated plant capacity.

Explosives research and testing by the Bureau in the 1942 fiscal year resulted in an increased volume of work to meet the growing demands of the mining industry, which normally uses more than two-thirds of all the industrial explosives manufactured in the United States. The Bureau made numerous chemical analyses, gallery tests, and control tests of a physical nature in the program of retaining safe characteristics of permissible mining explosives and also cooperated with the Ordnance Department of the Army and the Army Board of Engineers in explosives and demolition studies.

Effective December 26, 1941, the Bureau of Mines was designated by Congress to administer the Explosives Act of 1917, which was amended and invoked shortly after the United States went to war. Thereupon the Bureau set up a system of control by licensing manufacturers, dealers, and users and by establishing a field force of investigators. Licensing agents were appointed for nearly every county in the United States, regulations were promulgated under the law, and other effective steps were taken to prevent explosives or the ingredients of explosives from reaching and being used by persons hostile to the United States or persons careless or inexperienced in the use of explosives.

The far-flung health and safety activities of the Bureau assumed added importance because of the necessity for conserving skilled manpower and maintaining uninterrupted production in the mineral industries. A new responsibility in this field during the fiscal year was the setting up of the coal-mine inspection program as authorized by Congress in May 1941. Despite a delayed start, approximately 400 coal mines, producing almost 25 percent of the total coal tonnage annually produced in the Nation, were inspected up to June 30, 1942. Nearly 100 coal-mine inspectors were hired and trained and sent into the field, beginning December 1, 1941.

The Bureau continued instructing workers in the mining, petroleum, and allied industries in accident prevention, mine rescue methods, and first aid to the injured, bringing the total persons trained since 1910 to more than 1,500,000; investigating and reporting on mine explosions, fires, and miscellaneous accidents; and making field studies of various mining problems. A new unit composed of doctors, engineers, and chemists was established to investigate occupational disease in the mineral industries and to perform other important duties in the Bureau's program of improving health in this field of employment.

Other war agencies throughout the year called repeatedly upon the Bureau for economic and statistical information, and the requests were answered with full and complete data at all times. The Bureau's services in this respect included the collection, analysis, and publication of current and periodical data on all mineral commodities; studies of special economic phases of the mineral industries brought on by the war; and compilation of the Minerals Yearbook, the internationally recognized economic and statistical authority in this field. Many special statistical studies and investigations on strategic and critical metals and nonmetals, as well as fuels, were undertaken by the Bureau in cooperation with the several Government war agencies.

The Bureau published over 400 reports, including numerous bulletins, technical papers, handbooks, and Minerals Yearbook chapters. It replied to more than 100,000 letters of request for information and distributed about 550,000 copies of Bureau publications. Educational motion pictures acquired during the year totaled 546 sets; the outstanding borrowers of films from the Bureau of Mines were the Army and Navy air services, the Coast Guard, the CCC, and schools offering defense training classes.

The Bureau of Mines coordinated its work with that of other agencies of the Department of the Interior through the War Resources Council for the Department, which was established by Secretary Ickes for the purpose of mobilizing the strategic natural resources of the Nation on the scale made necessary by global warfare.

Future Work

To devote to the Nation most effectively the full benefit of its knowledge and experience for the winning of the war, the Bureau of Mines during the fiscal year 1942 made definite plans not only to utilize immediately the vast store of technical information acquired over a long period, but also to undertake new phases of work and new endeavors that would help to maintain the security of domestic mineral production and help to speed victory through the expanded output of usable strategic and critical minerals.

In anticipation of authorization and appropriation of funds by the Congress, the Bureau of Mines planned still greater enlargement of its

helium-producing facilities; an increase in its program for the exploration and development of domestic deposits of strategic, critical, and essential mineral ores; an intensification of its search and development of domestic substitutes for minerals formerly imported or for which the United States is still largely dependent upon foreign sources; and an expansion of its field investigations and laboratory and pilot-plant studies that would tend to increase production from known sources and develop usable substitutes for domestic materials in which critical shortages apparently were developing.

To expedite its future work as planned, the Bureau reorganized its operating structure during the last days of the fiscal year. Among the changes was the expansion of the Office of the Director to include an Assistant Director. As a result of new work undertaken during the year, the Health and Safety Service was expanded to include three additional divisions—a Coal Mine Inspection Division, the Explosives Control Division, and the Mineral Production Security Division.

The phases of work the Bureau scheduled for the fiscal year 1943 include the following:

The erection of pilot plants for investigating the best methods of producing sponge iron on a commercial scale will be undertaken. Direct reduction of iron ore by solid fuels and by natural gas are two of the processes to be employed to obtain a material that can be utilized during the war as a suitable substitute for scrap iron to mix with pig iron in the manufacture of steel.

To satisfy the anticipated needs of the military forces for helium, the Bureau will increase substantially its output of the noninflammable, light-weight gas by many additional millions of cubic feet. To achieve this unprecedented production goal, the Bureau planned to complete within the shortest possible time the new addition to its Amarillo (Tex.) plant, to undertake immediately the construction of a new plant, and to intensify the studies of other gas fields and to investigate possible additional plant sites.

Because of the limited known reserves of high-grade bauxite in the United States for the production of aluminum metal and for chemicals and abrasives essential to war industries, the Bureau will expand its investigations of methods of beneficiating low-grade bauxite ores, alumina-containing clays, alunite, and other potential raw materials.

Other strategic, critical, and essential minerals also will be investigated. The mineral exploration program will be expanded to include new areas and additional minerals. Hand in hand with this field work, laboratory studies of selected ores will be carried out and economic studies will be undertaken. From the data obtained, recommendations, where warranted by the facts, will be made to private industry and to Federal war agencies with a view to bringing all vital metals and nonmetals into production.

Further research will be done on magnesium in the laboratory and in pilot plants, additional studies will be undertaken on the beneficiation of chromite and on the production of electrolytic chromium, a pilot plant will be constructed and operated to obtain engineering data on the reduction of zinc concentrates with methane gas, and the resources of the West will be investigated and examined with a view to the feasibility of establishing a larger steel industry in that area.

Plans also were made for more effective enforcement of the Federal Explosives Act by the placement of explosives investigators throughout the Nation. Under the sponsorship of the Office of Civilian Defense, and in cooperation with other Federal, State, and local agencies, the Bureau will help protect the Nation's mines, quarries, smelters, and allied mineral facilities from sabotage and subversive action.

Review of the Year's Work

As the changes in the organization of the Bureau of Mines were not effected until 2 weeks before the close of the fiscal year, the activities of the Bureau described in the following paragraphs reflect the activities of the organization when it comprised four branches—Technologic, Health and Safety, Economics and Statistics, and Administrative. These branches administered and planned in Washington the activities that were carried on largely in the principal mining districts of the country through experiment stations, field offices, and district representatives.

Technological Work

Exploration of Ore Deposits

The Bureau of Mines centered its program of examination and exploration of ore deposits mainly on ores designated as "strategic" by the Army and Navy Munitions Board, namely, ores of antimony, chromium, manganese, mercury, nickel, tin and tungsten. Investigations also were started of raw material resources for western steel production (iron ore and coking coal) and of deposits of bauxite, alunite, and aluminum-bearing clay for the production of alumina. Near the end of the year, the Bureau began drilling for deep-lying magnesium chloride salts in Utah.

Highlighting the accomplishments of the year's work were the following:

About 2,345,000 tons of chromium ore—in Montana, California, Oregon, and Alaska—was added to the known reserves of the Nation. Three of the properties explored during the year already are in production.

An important new find of mercury ore of good, commercial grade was made in central Idaho, where 436,000 tons of low-grade (2.7 pounds mercury per ton) had been indicated earlier in the year in a partially developed section of the same property. The high-grade ore is in a body about 30 feet thick and at the end of the year had been reached by four diamond-drill holes over a strike length of 200 feet. It probably will be found to contain much more than 50,000 tons, averaging 8 pounds of mercury per ton. A second discovery of commercial-grade mercury ore was made by diamond drilling in an old mine in Oregon, recently closed because of depleted ore reserves.

The exploration of one deposit in Idaho indicated probable tungsten ore reserves of 150,000 tons, with reasonable expectation of developing 100,000 to 500,000 tons more. (In the 1941 fiscal year the largest and most important discovery of tungsten ore was made by the Bureau of Mines and Geological Survey. This deposit of ore is now making a substantial contribution to the war effort.) At three other tungsten mines in Nevada where ore reserves had been depleted, productive operations were resumed on new ore made known by the Bureau of Mines. Exploration at these mines was continuing at the end of the year.

Sampling in southeastern California and western Arizona revealed enough manganese ore to warrant construction and operation of one, and possibly two, 100-ton beneficiation plants, and completion of exploration in Arkansas established sufficient reserves of iron ore to warrant a 300- to 500-ton mill. More than 20,000,000 tons of iron ore were indicated by exploration of about 1 mile of an iron-bearing formation 6½ miles long in California, and over 8,000,000 tons in two other areas in Arizona and Oregon, respectively. Drilling in Georgia and Oklahoma revealed deposits of bauxite estimated to contain 165,000 tons of usable ore.

Seven hundred and forty deposits containing strategic minerals were given preliminary examination and were indexed and rated as to their relative importance. Sixty-five exploration projects were active during all or part of the year as follows: 1, antimony; 10, chromite; 3, manganese; 4, mercury; 2, nickel; 8, tungsten; 1, coking coal; 6, iron; 5, bauxite; 2, alunite; and 5, alumina clay. Some of these projects comprised work on 2 to 10 separate deposits.

Persons throughout the United States interested in the search for strategic minerals sent in samples of ore to the Bureau. More than 100 of these were examined during the year.

Metallurgical Investigations

Because many of the domestic ore deposits already known or explored by the Bureau are low-grade or complex, or both, the program

of developing and testing methods of beneficiation was given considerable attention. The laboratory investigations and pilot-plant demonstrated that substantial amounts of vital minerals for the can be made available from domestic ores.

Methods have been developed for the concentration of many : ganese ores to ferrograde manganese; for the recovery of chrom and ferrograde chromite from low-grade chromium ores; for the aration of alumina from clays and alunite; for the production of magnesia and magnesium; for the recovery of cobalt metal or e for increased production of lead; and for the beneficiation of : containing antimony, copper, iron, mercury, nickel, tungsten, : and fluorspar.

Ore Dressing.—Ore dressing provides a quick and inexpensive n to beneficiate the mined product. Studies were made of the co tration of ores containing the following strategic and critical m and minerals: Antimony, chromium, cobalt, copper, iron, manga mercury, nickel, tungsten, zinc, magnesium, fluorite, and andal. The results of laboratory investigation of about 140 ores conta one or more of these metals have been encouraging in almost a instance.

The concentration of more than 125 manganese ores from Western States was investigated. Although only half of the tested may be classified as amenable to concentration to ferro manganese, the production from these ores could make up much e indicated deficiency. Most of the ores that could not be benefie to ferrograde were readily concentrated to an intermediate g which would be desirable feed to either leaching or pyrometallur processes to produce high-grade manganese products.

Ore-dressing methods also were used in the laboratory and : plants for beneficiating manganese ores from the Eastern St. A pilot magnetic roasting and magnetic separation plant tro various manganese ore samples from the Cuyuna range of Minn and the Batesville district of Arkansas. Construction of float sink and leaching plants was undertaken to provide additional facilities for ore testing. Manganese concentration mills were des for the Batesville and the Cuyuna range districts, and for the Do district of New Mexico. Flow sheets for these mills were based laboratory and pilot-plant tests.

The ore-dressing pilot mill at Boulder City, Nev., was comp in September 1941 and immediately put in operation for treating manganese ore from the nearby Las Vegas Wash area. The operat proved the feasibility of beneficiating higher-grade ores to ferro and the lower-grade ores to an intermediate grade. Early in A 1942, the pilot mill was converted to testing the low-grade and re tory Artillery Peak (Ariz.) ore.

The Chamberlain (S. Dak.) pilot manganese-concentration plant is treating the nodule-bearing shale of the area to recover nodules. The process includes hand sorting, kiln drying, and screening the nodules from the shale. For experimental purposes, an explosive shattering unit was added to the plant.

Hydrometallurgy.—Numerous laboratory leaching tests on manganese ores that were not amenable to concentration by ore-dressing methods were completed. New procedures for dissolving manganese from the ore were devised and older processes improved. The nitro-sulfur dioxide process reached the pilot-plant stage. The sulfur dioxide-sulfuric acid leach was modified to produce a high-grade product from ores containing up to several percent phosphorus. Large-scale laboratory leaching tests using smelter flue gas containing sulfur dioxide were conducted. A new process was developed that may be used on manganese ores containing appreciable quantities of objectionable impurities, such as zinc.

The hydrometallurgical pilot plant treated ores too low grade for direct use in standard industrial ferro-alloy production. The manganese from low-grade ores was leached with sulfur dioxide, nitrogen dioxide gas, or dilute sulfuric acid. Manganese sulfate or manganese carbonate was obtained by evaporation of excess water. Further treatment by this leaching method yielded material highly suitable for electrolytic deposition of high-purity manganese metal in the pilot plant.

Domestic chromium ores usually may be concentrated to a product of low chromium:iron ratio. Reduction roasting of subgrade concentrates followed by acid leaching of the iron produces a residue which is smelted to standard ferrochrome. Construction of a 25-ton-per-day reduction roasting and leaching pilot plant was undertaken. A process was developed for recovering cobalt from domestic low-grade oxidized cobalt ore. This process yielded a high-grade cobalt oxide or cobalt compound suitable for the production of electrolytic cobalt metal.

Studies of various proposed methods for preparing alumina from bauxite, clays, and other aluminum-bearing materials resulted in the selection of a procedure for investigation in a small pilot plant. Samples from most Western States were run through the plant. The operation included dehydration of the clay followed by an acid leach. The electrolytic precipitation of hydrous alumina and the dehydration of alum produced in various ways were studied. Production of metallic aluminum from these products will be investigated.

Electrometallurgy.—The operations of the electrolytic manganese pilot plant determined optimum electrolyte concentrations, economic current densities, and the most satisfactory cell-room equipment for

commercial installations. Current efficiency was increased to 60 percent.

A process for producing magnesium metal by direct electrolysis of magnesia in a fused salt bath was developed. It showed excellent possibilities for utilizing domestic magnesites and dolomitic ores. An 8,000-ampere pilot electrolysis cell was placed in operation. Electrothermic reduction of magnesia by carbon is potentially a superior process for producing magnesium metal. Improved methods of overcoming technical difficulties were developed in a small pilot plant at Pullman, Wash. Methods also were developed for the production of high-purity electrolytic chromium.

Conditions were established for the electrodeposition of metallic cobalt from solutions obtained by the treatment of low-grade oxidized cobalt ore.

Pyrometallurgy.—Refractory low-grade manganese ores were successfully smelted with pyrite in an electric arc furnace to produce a manganese sulfide matte. This matte can be used as such in the steel industry or can be sintered to a 60-percent manganese product that will meet ferrograde manganese specifications. Fine, high-grade manganese oxide and carbonate ores, manganese carbonate flotation concentrates, calcines from deleading manganese oxide flotation concentrates, and calcines from the treatment of manganese sulfate were successfully sintered to meet ferrograde specifications.

The recovery of vanadium from titanomagnetites by smelting a sintered concentrate in the 6-ton University of Minnesota experimental blast furnace was investigated. Results showed trends that may be investigated in more detail in industrial furnaces and should lead to the recovery of a substantial quantity of vanadium from domestic deposits heretofore not utilized.

Methods were developed for taking advantage of the more rapid smelting rates for lead on the Scotch hearth furnace, using pelletized, richer and more finely divided flotation concentrates. A mechanical charging device was designed and installed. It was found that a good portion of the zinc wasted to lead blast-furnace slags may be separated and saved.

Testing Methods.—Many ores containing war minerals were subjected to microscopic examination, chemical analyses, and physical testing. In all, 3,500 prospectors' samples were tested for the occurrence of strategic minerals. The properties of various alloy systems were studied. New equipment was designed and built to extend the facilities of the laboratory. Considerable X-ray work was done on determining the structure of various alloys and in distinguishing between closely related minerals.

The investigation of the thermoelectric method of checking the composition of metals was continued to materials of higher alloy

content. Its usefulness in making acceptance tests on purchased materials and in sorting scrap metal was demonstrated. A simple, quick method, based upon the emergence of substances of fixed melting points, was developed for determining the temperature of molten metals, and work was begun to produce a complete series of test substances.

Metallurgical Fundamentals.—Because the control and improvement of energetics of processes for critical metals require precise data on the various forms of energy content involved in transformations of these substances, the Bureau determined the quantities of the various energy forms for the most important critical substances, with special emphasis on manganese, chromium, and magnesium. The magnetic properties of certain manganese alloys also were studied.

Nonmetals Research

The Bureau of Mines met heavy demands for cooperative assistance in the field of nonmetals, as well as metals, by the Federal war agencies.

The removal of impurities from low-grade bauxite by gravity-washing and froth-flotation methods was undertaken just before the beginning of the fiscal year, and by October 1941 improved methods of washing were determined.

A special appropriation for the investigation of calcium aluminate processes for extracting alumina from siliceous bauxite was used to test the Seailles process. The conclusion was that while the process can be operated technically, it is not attractive from the economic and practical standpoints. The lime-soda sintering process was one of the methods thought to be more practical. A sequence of operations was worked out that gives high extractions and recoveries of alumina of satisfactory grade. The process was scheduled for testing in a subcommercial test plant in the fall of 1942.

Foreseeing that the metallurgical demands for bauxite would make it necessary to substitute clay for bauxite in making aluminum sulfate (used in water treatment, paper manufacture, etc.), the Bureau undertook studies on preparing clays to make them suitable for this purpose. As a result substitution of properly calcined kaolins for bauxite can be recommended; and the War Production Board was reported to be working out the means for the production and use of such clay.

Substitutes were found for Indian kyanite, a mineral used for special refractories, formerly imported from near Calcutta. The most attractive one is topaz, which can be mined commercially in South Carolina. The War Production Board reported it is making arrangements for commercial production.

The shortage of flake graphite, normally imported from Madagascar,

for crucible and steel-ladle stoppers was foreseen during the fall of 1940, and work was initiated on the Alabama graphites that had been exploited during the First World War. A far larger size of flake now is needed than in 1917. Suitable means of milling the graphite rock were developed. The War Production Board, guided by these results, made arrangements for building five mills in three States.

Radio ceramic talc suitable for radio insulators was found to be insufficient for expanded needs during the winter of 1941. The Geological Survey sought suitable grades of talc available in quantity and the Bureau of Mines did the technical work of testing the talcs. Many were found to need flotation to remove impurities. Increased production along the lines recommended by the Bureau of Mines is expected.

The war in Europe cut off Belgian glass sand, which had supplied Pacific coast glass plants. A study was made of methods for scrubbing off iron stains and removing feldspar and heavy minerals from West coast sands. One of the larger glass companies undertook construction of a plant at Monterey, Calif., which will incorporate the Bureau's findings and produce high-grade sand in large quantities.

Deposits of the volcanic rock, dunite, made up mostly of olivine, exist in the Eastern States, as well as in the Far Western States, and electric-furnace fusion of the rock with sufficient reducing agent produces ferrosilicon and fused magnesium silicate, or forsterite. Tests of brick made with the forsterite showed it to be a desirable supplement to magnesite brick and usable as a substitute for refractory material formerly imported from Austria and Greece.

Coal and Coal Products

The Bureau of Mines expanded the consulting service that it maintains for all the Government agencies for: (1) The purchase and operation of steam generating and heating equipment, (2) the purchase and analysis of coal, and (3) the conditioning of water used in boilers. Consultation, acceptance tests, and inspections were provided on numerous equipment installations, particularly for the War Department. Attention was directed to the conversion of Federal plants on the East coast from oil- to coal-burning equipment.

More than 15,000 coal analyses were made and about half of these were in connection with the purchase of 3,130,000 tons of coal for the War and Navy Departments and 518,000 tons for other Government agencies. To obtain analyses for awarding Government coal contracts, Bureau of Mines coal-sampling trucks visited 468 mines in 12 States and collected 1,740 samples, primarily in areas adjacent to new war activities.

Coking Coal.—The construction of seven new blast furnaces in the West has created a demand for western coals that have satisfactory

coking properties. The Bureau's field exploratory crews and the coal-carbonization laboratory in Pittsburgh showed that certain coals of Oklahoma, Arkansas, Utah, New Mexico, Colorado, and Wyoming will meet the needs. The survey of the coking properties of coals of the United States, which the Bureau of Mines began in 1927, has been especially valuable in the selection and blending of coals for blast-furnace coke. Bureau of Mines laboratory research also provided information for coke-plant operators on the storing properties of coals of various compositions.

Gasoline From Coal.—The Germans, who have been working on processes for the conversion of coal to gasoline and oil since 1913, were so successful that it is estimated now that their plants will produce about 5,000,000 tons of gasoline annually. The Bureau has experimented with a hydrogenation process for several years and has determined the amenability of many American coals to liquefaction, which will be most useful in the future; moreover, the Bureau has developed a relatively low pressure hydrogenation treatment for producing a heavy fuel oil suitable for use as Bunker C oil. Valuable byproducts, such as phenols, cresols, and xylenols, also can be obtained from coal-hydrogenation products. The Fischer-Tropsch water-gas method is to be investigated during the coming year. Hydrogenation byproduct lignin from paper-pulp manufacture has been found to yield isopropylcyclohexanol, a material valuable in the plastics industry and of possible importance as an antiknock addition agent to gasolines.

Boiler Water.—Proper conditioning and treatment of boiler waters assumed added importance because of the war demand for uninterrupted steam production. Analyses of boiler water samples by the Bureau increased by 250 percent over 1941. Material improvement in efficiency and economy for boilers operated by the War Department resulted from this water-conditioning service.

Coal Storage.—To protect industrial and domestic consumers against coal shortages, storage of ample quantities of coal became essential. Because bituminous and subbituminous coals are subject to spontaneous heating and ignition, the Bureau instituted a survey of the action of coal under storage conditions in industry to determine the best practical methods of storing individual coals.

Coal Mining.—The Bureau initiated studies relating to consumption of power in the mines and indicated ways and means of effecting economies with no losses in efficiency.

Petroleum and Natural Gas

Although the war did not change the character of the research and investigative work of the Bureau of Mines on petroleum and natural

gas, it changed the emphasis on particular problems, created demands for volumes of factual data, and allowed less time in which to assemble and collate essential information. The Bureau was able to respond to the immediate needs of the War and Navy Departments, the Office of the Petroleum Coordinator for War, and other Government agencies for technical advice and information on several phases of the national program of supplying petroleum products for war uses.

Petroleum engineers of the Bureau made a survey of more than 200 crude oils and of the products from 25 condensate plants to determine their content of high-octane aviation-gasoline stock. They also undertook a series of tests to determine the most effective blending of various components of 100-octane aviation gasoline, and initiated a study to determine the components of the reservoir fluids and the available reserves in fields of the condensate type which yield hydrocarbons needed in aviation gasoline. Other typical assignments included a study of all possible petroleum sources of toluene for use in the manufacture of explosives, and a study of the possibility of augmenting supplies of paraffin wax.

In April 1942 the Bureau opened a petroleum field office at Franklin, Pa., to help 15,000 oil producers in the Appalachian region who lack technical staffs of their own to determine the best practical means of repairing wells and repressuring the sands with air and gas to stimulate the production of oil needed for special lubricants.

The Bureau turned the whole chemistry and refining program of the Petroleum Experiment Stations at Bartlesville, Okla., and Laramie, Wyo., to the search for technical answers to current practical questions regarding the essential nature of crude oils, natural gas, condensates, and their components. High-efficiency fractionating towers were designed and built; work progressed on desulfurization of marginal aviation-gasoline base stocks to improve their response to tetraethyl lead; and reports gave valuable information on volume and types of asphalts needed for military airport runways and roads.

Reports on the Bureau's methods of collecting and examining subsurface samples of petroleum, the results of its field studies, and a new basis for analyzing reservoir behavior, using pressure-production data, have advanced the technology of determining oil and gas reserves and pointed toward advisable methods of withdrawal under war conditions. Special attention was given to the effects of high gas:oil ratios, excessive pressure declines, and abnormally low rates of water encroachment. Subsurface samples were taken in various fields and analyzed for quantity of gas in solution, shrinkage resulting from gas liberation, and composition of the oil-gas mixtures in reservoirs. Core samples were subjected to connate water determinations, and studies were made of the permeability of porous rocks and productivity indexes of wells and fields. Contributions were made to the subject of well

spacing. The Bureau made reports on the proper blending of oil-well drilling mud-fluids and on methods of combatting heaving shales.

Information on the chemical nature and gas-water ratios of gas hydrates was obtained in cooperation with the American Gas Association. As a result, gas transmission lines can operate at higher capacities. Determinations were made of the distribution of residual gases returned to the producing formations by cycling operations in condensate fields to obtain maximum yields of liquefiable components.

The Bureau gathered a fund of information on stimulating production in "stripper" fields containing large oil reserves that may be recovered by well-planned, secondary-recovery methods. They also reported on the treatment of oil-field brines and their use as a repressuring medium in water-flood projects.

The Bureau conducted tests on tanks which gave valuable information on changes that may be expected in aviation gasoline and evaporation losses of blend components stored for the war use.

The far-sighted policy of research, development, and conservation followed since the Bureau's helium program was initiated during the last World War makes it possible to supply this gas in quantity to the United States armed forces in the present conflict. The Amarillo (Tex.), helium plant produced more helium in 1942 than in any previous fiscal year. The Amarillo helium plant is being enlarged, and a new plant is being built. The Cliffside field now has a total of nine wells producing helium-bearing gas.

Explosives

Experimental research on explosives developed new findings, many of which are directly applicable to military explosives and have been used by the war agencies. The research program included studies of sheathed explosives, the production of toxic gases by explosives, the ignition hazards of explosives when used in the presence of combustible gases and dust, the strategic properties of liquid-oxygen explosives, and an underlying inquiry into factors affecting the temperatures and pressures developed by explosives.

For protection of equipment and personnel in special war industries against very rapid gas explosions, certain high-speed explosion diaphragms were developed; and to assist the synthetic rubber and plastics industries, studies were made of explosion and inflammability characteristics of butadiene, styrene, acrylonitrile, chlorobenzene, and trichlorethylene. Other studies included one of methods of preventing explosions due to hydrogen liberation in the charging of storage batteries. Further work was done on the use of helium in preventing explosions of anesthetic mixtures; and a study of the chemical factors controlling anthracite mine fires was completed.

gas, it changed the emphasis on particular problems, created demands for volumes of factual data, and allowed less time in which to assemble and collate essential information.  characteristics of butadiene, styrene, acrylonitrile, chlorobenzene,
 and trichlorethylene. Other studies included one of methods of
 preventing explosions due to hydrogen liberation in the charging of
 storage batteries. Further work was done on the use of helium in
 preventing explosions of anesthetic mixtures; and a study of the
 chemical factors controlling anthracite mine fires was completed.

84 · *Report of the Secretary of the Interior*

For safeguarding war industries using Diesel engines in explosive or combustible atmospheres, a testing gallery was completed and put in operation.

The Bureau explosives-testing program, carried on for many years with a view to maintaining safe characteristics in explosives and blasting devices used by the mineral industries, moved forward rapidly. The Bureau made 111 chemical analyses, 958 gallery tests, and 678 control tests of a physical nature in the 1942 fiscal year.

As part of the scientific research carried out in connection with administration of the Federal Explosives Act the Bureau, at the request of the Ordnance Department of the Army, made plant-security studies of some ordnance facilities and developed valuable information relating to manufacture of explosives. The Bureau also made some demolition studies in cooperation with the Army.

Several disasters were investigated, including those that occurred at a black powder plant, a primer plant, two pyrotechnic plants, a railroad torpedo plant, and a quarry.

Since the increasing use of inflammable metal powders in the war industries has created new and additional dangers from dust explosions, the Bureau extended its studies of metallic dust hazards. One result was the discovery that hard pitch (in granulated form) is an excellent agent for extinguishing magnesium fires in industrial plants where the use of sand and similar agents might harm machinery and equipment.

The Bureau assigned an engineer to cooperate with the Chemical Warfare Service of the War Department, in connection with the latter's civilian protection activities, to conduct training work and to assist in the research work on the extinguishment of incendiary bombs and on kindred war problems.

Upon completion of its studies of the effects of seismic vibrations from quarry blasts, the Bureau began a study of air waves from blasts, and the technique developed was applied to military problems.

Safety, Plant Protection, and Health Activities

Conservation of manpower and mining equipment and the protection of mineral facilities from serious damage or destruction by carelessness, neglect, sabotage, or subversive action were made paramount by the war. Safety education and accident-prevention work, supported by investigative and testing activities, carried on in the same manner and with equal effectiveness as in past years, constituted the keystone of the vastly expanded safety and security program. The power of entry to coal mines, conferred on the Bureau by the Federal Coal Mine Inspection Act enacted in the previous fiscal year (May 1941), and the regulatory powers granted by the Federal Explosives

Act approved December 26, 1941, as well as the broad authority implied in Executive Order 9165, of May 19, 1942, dealing with the national facility security program, proved to be of considerable assistance.

The need for safety education and training and retraining of mineral industry workers in first-aid, accident prevention, and mine rescue operations, became progressively greater as increasing numbers of employees were drafted for military service, migrated to better-paying war industries, or absented themselves, leaving their ranks to be filled by men inexperienced and untrained in the newer mechanized operations.

Safety Work

Engineers and safety instructors of the Bureau trained 90,206 employees of the mining and affiliated industries in first aid and mine rescue during the fiscal year, bringing the total number of persons who have completed such courses since the establishment of the Bureau in 1910 to 1,538,758. Moreover, with the training of 1,459 persons as first-aid instructors, more than 16,000 persons throughout the country became qualified to teach the Bureau of Mines first-aid course in the civilian defense program of the Office of Civilian Defense. During 1942, 117 additional mines and plants were awarded certificates showing that all employees had been trained in first aid. Since the Bureau has been convinced that persons trained in first aid are less likely to injure themselves or be involved in accidents, it has further promoted such training by endorsing and aiding first-aid competitions. During the year, it awarded certificates to 1,072 persons who qualified as judges for first-aid contests and assisted in conducting 61 first-aid contests in 11 States.

The Bureau's personnel instructed 2,008 mine workers in mine rescue work, and gave its advanced mine rescue training course to 138 persons during the year. These men, familiar with the use of gas masks, oxygen breathing apparatus, and procedures connected with fires and explosions in confined places such as mines and tunnels, constitute an efficient reserve for use in civilian defense and rescue work.

At virtually all major mine disasters, Bureau personnel assisted in the rescue and recovery operations, sometimes at the risk of life or limb. The Bureau's engineers investigated 24 mine explosions in 11 States, 25 mine fires in 15 States, and 52 miscellaneous accidents in 24 States during the year. Rigid inspections were made of 43 privately owned mine rescue stations at the request of the owners.

The Bureau's plan of giving accident prevention courses was continued. During the year 112 persons were trained in the course for coal-mine officials. A total of 8,521 mine officials and others have

taken the complete course, and 5,122 have received partial training since 1930 when the course was inaugurated. The accident-prevention course, especially designed for coal miners, has been given in complete form to 1,841 miners and in partial form to 795 others since the course was organized in 1940. An accident-prevention course for metal miners was introduced and given to 160 metal-mining officials. During the fiscal year, 170 persons completed a course of instruction in petroleum safety, and 120 others received part of the training.

In its safety education program for the mineral industries, the Bureau utilized motion pictures, slides, exhibits, testing galleries and similar educational tools extensively. During the year, sound motion pictures on safety subjects were exhibited 170 times at safety meetings. Thirteen safety exhibits were shown in 10 States at fairs and expositions in mining districts and at mining conventions. The Bureau's representatives attended, and at times addressed, 612 safety meetings held in 33 States.

Testing work on electrical machinery and equipment, to determine their safety for use in gassy and dusty atmospheres in mines, was continued. The Bureau approved 50 additional machines and types of apparatus during the year, and made 282 explosion tests for the Navy on certain explosion-proof enclosures intended for use on ships.

The Bureau has three all-steel railroad coaches equipped for safety training and for recovery work following mine disasters; two are in active service, and one is held in reserve for emergency use.

The yearly Nation-wide statistical survey of mines, quarries, mills, smelters and coke ovens, which reveals the number of men employed, man-hours worked, and the number and causes of occupational accidents, was made again, bringing up to date this information that is essential to accident-prevention work. A preliminary survey also was begun to obtain accident data on the petroleum industry.

Coal-Mine Inspection

Although the Federal Coal Mine Inspection Act of May 7, 1941 (Public Law 49, 77th Cong.), was passed before the United States entered the war, its importance in the war effort has increased correspondingly with the growing dependence on coal to keep the Nation's vital industries operating at full speed. Despite a delayed start in inspecting mines, because of the time required for examining, qualifying, certifying, and appointing applicants through the Civil Service Commission and for training the new inspectors in the Bureau's policies and procedure, 400 coal mines in all were examined between December 1, 1941, and June 30, 1942.

Most of the mines inspected were the larger ones; their combined production was 24.7 percent of the total annual output for the United

States in 1941, and their combined employment was 117,346 persons, or 21.9 percent of the total coal-mine employment in that year.

The mine inspections consisted of a thorough examination of the local conditions, including careful observation and study of the practices, conditions, and equipment in and about the mines, the collection and analysis of dust and air samples, and a compilation and interpretation of the mine accident records. A preliminary report, calling attention to the hazards that require immediate attention, was posted at the mine at the completion of each inspection; and a detailed report, available for public inspection, was transmitted later to the management, the miners' labor organizations, and the State mine inspection agency.

The reception of the inspection program by the industry was favorable generally, once the inspection work got under way. Although there were some criticisms, mine management, mine workers, and State inspection services demonstrated their cooperativeness. In many instances, hazardous conditions and practices pointed out by the inspectors were corrected immediately.

In addition to the inspections, inspectors and other engineers of the Bureau made special investigations relating to explosives and electrical equipment in mines and other individual phases of coal mining.

Federal inspection of mines has not been in operation long enough to determine what effect it will have on the disaster and accident records of the country. The inspection procedure is, however, exerting a definite influence toward the reduction of accidents, in spite of handicaps resulting from the war. According to available records, all major industries have shown far greater increases in accident rates than the coal-mining industry since war production entered its peak phases.

Explosives Control

The Bureau of Mines is charged with administering the Federal Explosives Act of 1917, which was amended and invoked on December 26, 1941 (Public Law 381, 77th Cong.). Aimed at the prevention of sabotage and the misuse of explosives, it provides for control of the manufacture, purchase, sale, use, and possession of nonmilitary explosives and explosives ingredients by means of a licensing system, accompanied by investigations of the manufacture and storage, thefts or losses of explosives, and fires and explosions in which explosives are believed or known to be a contributing factor. Regulations promulgated by the Bureau have the force of law, and violations thereof are penal offenses.

The Bureau appointed 4,400 licensing agents throughout the United States and Territories and possessions. These licensing agents, who serve without pay except for a 25-cent fee which they are entitled to

collect from each person to whom a license is given, issued about 145,000 licenses to vendors, purchasers, and foremen by the close of the fiscal year. The Bureau itself examined and acted upon 2,000 additional applications for licenses from manufacturers, schools, colleges, and laboratories.

Forty-eight explosives investigators were appointed and stationed in the various States and in Alaska to supervise and guide the licensing agents and to investigate the manufacture, handling, and use of explosives. Inasmuch as the mineral industries are the principal nonmilitary users of explosives, the investigators' work was directly connected with the safety and mineral security program of the Bureau. The investigators, who made reports on more than 750 stores of explosives of which 450 were in critical areas, were assisted by other engineers and technicians of the Bureau in investigating fires and explosions in mines, quarries, munitions plants, and fireworks factories.

To facilitate its explosives control work and to coordinate it with the entire Federal program, the Bureau established liaison with the Army and Navy Intelligence services, the Office of Civilian Defense, and the office of the Chief of Ordnance and the Provost Marshal General.

Information was collected by the Bureau, as in past years, on the quantity of industrial explosives manufactured and used in the United States, and the estimated quantity of nitroglycerin and other ingredients used in the manufacture of explosives.

Antisabotage

As its part in the Nation-wide emergency program of the Federal Government to protect vital production, supply, storage, and transportation facilities, the Bureau undertook to make secure the continued production of vital war material from the metal mines, coal mines, quarries, mills, smelters, and allied mineral facilities. The Bureau received an allotment of funds from the appropriation made by Congress for this program toward the close of the fiscal year. The administrative organization to handle this work was set up, and the Bureau prepared to employ and train an initial field force of 75 to 100 engineer-investigators who could carry out the work in close coordination with the mine inspectors, explosives investigators, safety engineers, and other field personnel of the Bureau, as well as in co-operation with the field personnel of other Federal agencies concerned in the facility security program.

Health in the Mineral Industries

Activities of the Bureau in the field of health were expanded during the year. A new unit comprised of doctors, chemists, and

engineers was established to make investigations and studies of occupational diseases in the coal-mining industry, in conjunction with the inspection work; and the Bureau's gas and dust laboratory was enlarged to handle the greatly increased volume of analytical work created by the large quantities of mine gas and dust samples received from the mine-inspection field force. The laboratory analyzed 5,300 gas samples as compared with approximately 1,500 during the previous fiscal year.

The Bureau tested scores of respiratory devices for protection against noxious gases, fumes, and dusts, which were submitted by manufacturers, and gave its approval to several such devices. Manufacturers were advised on the development of more efficient respiratory equipment, and information was provided the public on the use and limitations of existing respiratory equipment. The Bureau issued more than a dozen publications on air contamination or contaminants.

At the request of, and in cooperation with, the Army and the Navy, confidential studies were made with respect to health factors in some military equipment.

Through laboratory studies and through investigations in underground tunnels in New York, Tennessee, and Colorado, the Bureau obtained information that may be of value in increasing the use, under well-controlled conditions, of Diesel equipment on underground main haulage without hazard to health.

At the request of the New York City Tunnel Authority, the Bureau also investigated the probable effects of air contamination at a portal of a newly projected vehicular tunnel. Tests also were made in a wind tunnel, the results of which may lead to the safe ventilation of vehicular tunnels without contamination of the atmosphere at the mouths of such tunnels.

Economics and Statistical Services

The accelerated demands resulting from the war for current comprehensive data on production, trade, distribution, supply, and consumption of minerals and mineral commodities on the part of the operating divisions of the Bureau, as well as the increasing needs on the part of the other Federal war agencies and the war industries, resulted in a marked expansion of the Bureau's economics and statistical services. In addition to the collection, analysis, and publication of current and periodical data on all mineral commodities, the Bureau studied and reported on special economic phases of the mineral industries, with particular emphasis on the strategic and critical metals and nonmetals and the fuels required by the war industries.

By means of the available data and through representation on committees and conferences, the Bureau was able to advise the war

agencies on threatened bottlenecks in supply, on advisability of expanding plant facilities, on production and plant capacities, and on possible substitution of some minerals for others.

The Minerals Yearbook (Review of 1940) was published at a much earlier date than in the previous year, and the preprints of all chapters were available by August 1941. Many chapters of Minerals Yearbook (Review of 1941) were prepared and some were available for distribution by the close of the 1942 fiscal year.

Metals

Although domestic metal-production facilities were sustained at maximum capacity throughout the year, the demand for metals in many cases exceeded the supply, and as a result the Government imposed a priority allocation system and placed severe restrictions on the consumption of critical metals by other than the war industries. To keep pace with the rapidly shifting situation, the Bureau's war-time augmented staff of commodity experts was frequently consulted and the Bureau provided the war agencies with detailed statistical studies of 30 commodities on a monthly basis to cover both producer and consumer phases. In the case of many of the metals, similar data were furnished to show the picture of raw materials used. Of a total of 120 separate surveys conducted during the past fiscal year, 75 were designed specifically for the use of war agencies. This not only represents an increase in the number of surveys undertaken but also a marked expansion in the number of persons replying to Bureau questionnaires.

As the problem of obtaining additional supplies of new metal became more acute, the question of available secondary metals was raised to major importance. The Bureau, now operating under policies outlined in the general preference orders of the War Production Board, converted the quarterly iron and steel scrap survey to a monthly statistical review showing stocks, receipts, production, consumption, and other data as reported by about 19,000 respondents, including producers, dealers, brokers, and consumers of scrap. Results of the surveys were made available to various war agencies and served as the basis of much of the scrap allocation program. Surveys of 3,000 consumers and 4,000 dealers of nonferrous scrap were broadened to include the reports of metal produced from scrap as well as scrap consumed. Magnesium was included for the first time in the growing roster of scrap metals.

The monthly canvasses of copper, lead, and zinc production inaugurated the previous year also were expanded. The usual preliminary reviews of nonferrous metal mining, including gold and silver, in 13 Western States in 1941 were released by the middle of January

1942; and final detailed statistics on copper, lead, and zinc for each of the 13 Western States and for Alaska, for incorporation in the individual chapters of *Minerals Yearbook*, 1941, were completed before the end of June 1942.

Nonmetals

In addition to the regular, periodic compilation of data on non-metallic minerals, including two monthly cement reports, a quarterly gypsum report, and a semiannual phosphate rock report, the Bureau made monthly canvasses of mica, graphite, asbestos, barium oxide, and natural sodium compounds; a semimonthly canvass of cement; and special canvasses of quartz crystal, mineral pigments, and industrial diamonds.

Special studies also were conducted by staff members on the sources of high-grade dolomite needed for making magnesium metal; sources of magnesia; processes for recovering magnesia from dolomite; magnesia refractories; resources and uses of monazite; uses and supplies of strontium; sources of high-grade clays for aluminum salts; and nonmetallic mineral industries in the South.

The Bureau compiled a review of all important trends and accomplishments in the nonmetallic mineral field in 1941; and, to assist present or prospective operators in securing markets for their products, developed special facilities and prepared a series of reports covering the marketing problems of various minerals and including lists of prospective buyers.

Petroleum and Natural Gas

The Bureau continued its comprehensive collection of statistics and economic data covering the operations of the petroleum and natural gas industries. Although the Bureau has no jurisdiction with regard to transportation shortages, control of production, rationing, readjustments in refinery operations and similar problems brought on by the war, it was able to assist those Government agencies responsible for solutions with essential current data.

The monthly statistics of aviation gasoline, initiated in October 1939 and supplemented by capacity surveys, proved of special value to the program of expanding output to meet war requirements. The Bureau adapted and altered its work on forecasts to meet Government requests for longer-term estimates of national demands, as well as to forecast requirements on critical areas such as the East coast. The forecast of demand for crude petroleum by States of origin found use as basic data for Federal allocations.

Coal and Coke

Because of the altered conditions in the coal and coke industry brought about by such factors as the increased needs for metallurgical coke, the off-season demand for solid fuels, and the greater storage of coal by consumers in anticipation of transportation difficulties, the Bureau found the Federal war agencies dealing with this industry in need of more comprehensive and more up-to-date statistical information. Accordingly current studies were expanded, new studies were inaugurated, and the dates for the return of questionnaires by the industry were in many cases moved ahead.

The Bureau completed according to schedule its regular annual reviews on developments in the Pennsylvania anthracite industry and the lignite, byproduct and beehive coke, fuel briquet, packaged fuel, and peat industries; and continued its monthly and weekly reports on the various phases of the anthracite, coke, and byproducts industries. At the same time, it furnished the war agencies with special reports.

A field survey on the dredging of anthracite and an historical study of the production of coal, petroleum, natural gas, and electricity in the United States, 1929-40, were completed.

Data on Foreign Minerals

The lack of statistical and economic data formerly obtained from official sources in Axis and enemy-occupied countries, and suspension of the publication of similar data usually obtained from allied and neutral countries prompted the Bureau to establish a service whereby essential statistical information relating to current production, stocks, and exports of strategic and critical minerals is obtained on a confidential basis from official sources in nonenemy countries.

As a result of the Bureau's policy of withholding publication of all data that might give aid to the enemy, publication of foreign statistical and other economic information was stopped but was provided on a confidential basis to all war agencies.

The five foreign mineral specialists assigned the previous year as technical advisors to certain of the American embassies in Latin America continued in the same status during the current fiscal year. A mining engineer was assigned to Mexico for checking Mexican resources of mica, manganese, tungsten, tin, mercury, and other strategic minerals.

Public Information

In response to direct requests from individuals and agencies concerned in mineral production, the Bureau distributed about 196,000

copies of the Bureau's printed publications and approximately 350,000 processed reports and monthly lists of publications. About 100,000 copies of the printed reports of the Bureau were sold by the Superintendent of Documents.

The Bureau decided that some of the material published previously might be of aid and comfort to the enemy, and for that reason, as well as the desire to economize wherever possible, discontinued a few of its publications such as the *Foreign Minerals Quarterly*, and changed its other reports dealing with foreign conditions to a confidential basis. Other current reports dealing with demand, supply, and consumption of strategic and critical minerals also were placed on a confidential basis and their distribution was restricted to a limited list of Federal officials. All other publications were carefully reviewed to avoid the disclosure of vital information; the size of the editions of processed material was cut, and the style altered with the resultant saving of about 400,000 sheets of paper.

Exactly 440 reports (comprised of 22,500 manuscript pages and 1,800 illustrations) were prepared for publication as bulletins, technical papers, handbooks, *Minerals Yearbook* chapters, and contributions to technical journals. The Bureau added 3,314 books to its Washington library; received 295 periodicals; and loaned 23,788 publications for outside use. In addition to the thousands of letters dealing with technical material, the Bureau replied to more than 70,000 letters from the public requesting publications or general information on minerals. Ten exhibits illustrating the Bureau's work were prepared and shown.

Educational motion pictures from the large film library of the Bureau were circulated more extensively than ever. The Army Air Forces, the Naval Air Stations, the Coast Guard, the N. Y. A. and schools, colleges, and other centers for defense training were outstanding borrowers. The total number of showings during the year was reported as 99,699, with an estimated attendance of 10,366,166 persons. The Bureau acquired 546 sets of new films, all made, in accordance with past procedure, in cooperation with industrial concerns that pay all of the costs of production and provide the Bureau with copies for free loans.

Administration

The Bureau's activities during 1942, as in past years, were administered from Washington, D. C., but were carried on mainly in the field. The Bureau opened a new petroleum field office at Franklin, Pa., and a new district office for health and safety work at Mount Hope, W. Va.

Personnel

On June 30, 1942, there were 2,104 full-time employees on duty in the Bureau, as shown in the following table:

Classification and number of appointees

	Profes- sional	Subpro- fessional ¹	C.A.F.	Cus- todial ²	Total
Washington.....	³ 66	4	301	6	377
Pittsburgh.....	⁴ 146	88	141	82	457
Field.....	⁵ 613	157	291	209	1,270
Total.....	825	249	733	297	2,104

¹ Includes instrument makers, etc.

² Includes laborers, mechanics, etc.

³ Engineers, 14; chemists, 4; metallurgists and metallurgical engineers, 3; miscellaneous, 45; total, 66.

⁴ Engineers, 48; chemists, 53; metallurgists and metallurgical engineers, 3; miscellaneous, 42; total, 146.

⁵ Engineers, 221; chemists, 71; metallurgists and metallurgical engineers, 98; miscellaneous, 223; total 613.

In addition to the foregoing full-time employees, there were 798 employees holding appointments on a when-actually-employed basis as follows: 42 consultants; 125 excepted; 13 classified; 3 unclassified; and 615 field agreements.

Property

The records as of June 30, 1942, show that the property of the Bureau had a total valuation of \$7,320,530, of which \$3,209,606 was for land, buildings, and improvements; \$1,127,928 for machinery and power-plant equipment; \$713,415 for laboratory equipment; and the remainder for certain helium properties, office furniture, automobiles, and other goods.

Finances

The total funds available to the Bureau of Mines for the fiscal year ended June 30, 1942, including direct appropriations, departmental allotments, reappropriated balances, and sums transferred from other departments for service work, were \$10,894,518. Of this amount, \$9,133,940 was spent, leaving an unexpended balance of \$1,760,578. On the regular work of the Bureau, \$7,210,643 was expended. These figures are subject to revision because of unpaid obligations.

Table 1 presents classified and complete information regarding the financial history of the Bureau since its establishment in 1910.

Table 2 gives a statement of the distribution of congressional appropriations to the branches and divisions and the expenditure of these funds in 1942 by Bureau divisions.

BLE 1.—Bureau of Mines appropriations and expenditures, fiscal years ended June 30, 1911-42

Fiscal year	Appropriated to Bureau of Mines	Departmental allotments ¹	Funds transferred from other departments ²	Total funds available for expenditure	Unexpended balances	Total expenditures	Expenditures, exclusive of service items ³
1911	\$502,200.00	\$34,200.00	-----	\$536,400.00	\$22,818.27	\$513,581.73	\$513,581.73

Includes printing and binding, stationery, and contingent funds.

Includes proceeds from sales of residue gas.

Service items include Government fuel yards, helium, and other investigations and services for other departments.

Includes gas investigations for War Department.

Includes \$1,586,388 for Government fuel yards.

Includes War Minerals Relief Commission, \$8,500,000.

Includes \$719,476.67 unexpended balance reappropriated.

Includes \$120,216.38 unexpended balance reappropriated.

Includes \$102,354.19 unexpended balance reappropriated.

Includes \$159,580.70 unexpended balance reappropriated.

Includes \$241,713.96 unexpended balance reappropriated.

Includes \$231,056.04 unexpended balance reappropriated.

Includes \$50,000 unexpended balance reappropriated.

Includes \$27,585.51 unexpended balance reappropriated.

Includes \$2,612.45 unexpended balance reappropriated.

Includes \$3,965.45 unexpended balance reappropriated.

Includes \$8,399.29 unexpended balance reappropriated, and balance of \$35,544.39 receipts from sale of

ium and other products.

Includes \$13,541.41 unexpended balance reappropriated, and balance of \$58,822.55 receipts from sale of

ium and other products.

Includes \$6,000 unexpended balance reappropriated, and balance of \$85,452.95 receipts from sale of

ium and other products.

Includes \$934,013.68 balance reappropriated, and balance of \$87,431.51 receipts from sale of helium and

er products.

Includes \$1,229,937 balance reappropriated and balance of \$128,019 receipts from sale of helium and

er products.

Estimated.

Bituminous Coal Division

DAN H. WHEELER, Director

[HE attack on Pearl Harbor found the bituminous coal producing industry, with its markets stabilized under the Bituminous Coal Act of 1937, in the soundest condition in many years to meet its wartime responsibility as the Nation's principal source of fuel.

It found in the Bituminous Coal Division, the administrator of this war, a central source of statistics and other information and technical assistance readily available to the Government in taking steps to protect the soft-coal supply.

In addition to regulating the coal markets to help the producing industry keep itself in a sound condition, the Division since the war has become one of the primary aids of the Office of Solid Fuels Coordinator for War. Also, it is assisting the Office of Price Administration in maintaining an anti-inflationary ceiling over soft-coal prices, and is serving as the principal source of statistics and, in many instances, providing technical advice for the various other governmental agencies concerned with problems relating to the fuel supply.

Industry Strengthened

A little more than a year prior to the attack upon the United States, the bituminous coal producing industry, with the establishment of minimum prices and marketing rules and regulations on October 1, 1940, had emerged from nearly two decades of savage, competitive warfare that had financially drained and seriously weakened it. The year and three months of market stability which the industry had enjoyed under Coal Act regulation had given it an opportunity to repair much of the damage of the years of chaos before it plunged into the job of meeting wartime fuel demands.

Decisive battles are fought on the industrial front, and fuel is vital ammunition in this modern age of highly developed industrial organization and mechanical warfare. Bituminous coal is the Nation's principal fuel. The head start which the soft coal industry had in

rehabilitating itself, and the continuation of the stabilization of its markets under the Coal Act, are major contributions toward assuring an adequate supply of this fuel for war needs.

Prior to the war, soft coal provided approximately 75 percent of the power for manufacturing, 80 percent of that for railway locomotives, and about 70 percent of that for steam-generated electricity. Also, it was the most common fuel for homes, and the source of raw materials for many essential military and civilian materials, such as explosives, artificial silk and rubber, medicines, plastics, paints, and chemicals. Now that the war is reducing the availability of other fuels in certain areas of the United States and Canada, coal must carry a still greater share of the fuel burden.

Aids Planning Coal Supply

Planning and protection of an adequate coal supply in time of war is one of the most important governmental functions correlated with its actual military operations. The industries that mine and transport this fuel require much labor and large quantities of strategical materials. They are constantly exposed to the disruptive forces set loose by world conflict, and careful thought and constant vigilance are necessary to keep coal moving in required quantities from the mines to consumers.

In requesting the Secretary of the Interior to act as solid fuels coordinator to protect the fuel supply, President Roosevelt, in his letter of November 5, 1941, stated:

As the defense effort progresses it will become increasingly urgent to assure that the supply of solid fuels will be adequate and that they will be readily available at consuming points when required for military, industrial, and civilian purposes. Difficult problems are already arising with respect to their supply and availability for such uses. These problems require the efficient and careful coordinated development, production, distribution, utilization, transportation, and handling of solid fuels.

You have in your Department extensive information and facilities with respect to solid fuels. I refer particularly to the Bituminous Coal Division, the Bureau of Mines, and the Geological Survey. In addition, in your capacity as Petroleum Coordinator for National Defense you have important functions with respect to oil and gas. It is essential that the handling of solid fuel and of oil and gas problems should be closely coordinated in the present emergency.

Immediate Action Made Possible

Rather than to organize a large staff to carry on the work of coordinating the soft-coal supply, the facilities of the Bituminous Coal Division were made available for that purpose. Additions were made to the Division where necessary to accommodate the additional duties entailed by the Solid Fuels work. A great deal of information per-

ing to the production, transportation, distribution, storage, and assumption of soft coal, compiled primarily for use in the regulation coal markets, was made immediately available to the Solid Fuels Office. In addition to this, a well-trained staff of technical employees was placed at the disposal of that Office. This saved a great deal of valuable time and a substantial amount of money, and it materially expedited the work of protecting the Nation's coal supply.

With this assistance, the Office of Solid Fuels Coordinator for War was enabled to launch immediately a program to aid the coal and transportation industries and fuel consumers to take wartime precautions. This program included steps to stimulate consumers to increase their stocks of coal while the fuel was readily available as protection against possible emergencies; to keep coal moving in heavy volume during the off-season to avoid loss of the use of limited labor and equipment; to aid producers in obtaining priorities to obtain rationed equipment and materials; to help the coal industry establish emergency arrangements to counteract the loss of regular coal transportation facilities due to wartime disruptions, and other actions in connection with planning and maintaining an adequate coal supply.

Additional Data Necessary

Although the information readily available in the Division made it possible for the Solid Fuels Office to begin effective work at once, and planning required the compilation of much additional data to meet problems peculiar to the wartime coal supply. Much of the information had been compiled in shape designed particularly for market regulatory purposes, and had to be revised and brought up to date to be adequate for use by the Solid Fuels Office.

For instance, information available from mine invoices showed each mine's shipments of particular kinds, qualities, and sizes of coal during recent years, thus giving some indication of the mine's past ability to produce. Other information was available which shed still more light on mine capacity. But the available data left too much to guesswork in estimating the Nation's capacity for producing and shipping the various kinds, qualities, and sizes of coal with the degree of accuracy necessary in wartime.

With the aid of the Bituminous Coal Producers' Boards, the Division, at the request of the Solid Fuels Office, began a more adequate survey of actual and potential mine capacity; the first to be made in recent times. The Producer's Boards are comprised of the elected representatives of the producers in each district, and represent the industry in participation in the administration of the Coal Act. They have intimate contact with the mines in their respective districts. At the close of the fiscal year, this survey was well under way and

already was providing useful information, although it was not complete, due to the large number of mines to be covered.

Early in the war it became manifest that the draft, enlistments, and the loss of men to other industries were having a substantial effect in reducing the labor supply available to the coal industry. Some producers reported that their production was being severely hampered, particularly by the loss of keymen. The Division was requested by the Solid Fuels Advisory War Council, a wartime industry-public advisory body on coal and coke problems, to make a study of the effect of the war on mine labor. This study showed that the mining industry had lost 48,439¹ men as of March 31, 1942, because of war reasons.² Appeals were made by industry and the Solid Fuels Office to Selective Service authorities to help protect the supply of mine labor.

It became apparent that the rubber shortage would have a substantial effect upon the coal supply that would require planning to counteract. The Division studied the over-all effects of the rubber situation, to provide information as required. It was found that approximately 50 million tons of soft coal per year move from the mines to consumers in motor trucks.

Coal Stocking Program Aided

Statistics compiled by the Division showed that all during the spring of 1942, coal was flowing into consumers' storage piles in great amounts, in response to the program operated by the Solid Fuels Office in conjunction with other agencies of the Government and the coal and transportation industries. But, the available figures indicated that a great many individual consumers, including many important war industries, were failing to take adequate precautionary measures. To probe this situation accurately, the War Production Board and the Solid Fuels Office undertook, with the Division's help, a plant-by-plant survey of the precautions being taken by prime war industries and the railroads.

The investigation bore out what previous information had indicated. Many industries were not taking adequate precautions. These were searched out, and the Division was engaged in preparing notices warning the individual plants of their situation, which were to be sent out by the Solid Fuels Office.

At the request of the Solid Fuels Office, the Division investigates and makes recommendations upon applications by coal producers for priority ratings to obtain materials and supplies for expanding or

¹ This figure was computed on 80 percent of the tonnage. Projected to cover 100 percent of the industry, it would indicate a loss of 60,549 men. Due to recruitment, the net shortage of men was computed at 33,765 as of Mar. 31, 1942.

² Entering military service, shifting to other industries, and because of inadequate transportation.

rehabilitating mine production facilities. Such applications are referred to the Solid Fuels Office by the War Production Board for advice before acting upon them.

Also, the Division investigates and makes recommendations to the Solid Fuels Office regarding applications for necessity certificates in connection with income-tax deductions sought under section 124 of the Internal Revenue Code which provides for amortization within 5 years of the cost of expanding plant facilities for the production of goods essential to the war program.

The Division has furnished technical personnel which is engaged currently in assisting preparation of details of an emergency coal distribution program for the Office of Solid Fuels Coordinator for War. All the information in the Division's records, needed in preparing the program, has been made available to the Solid Fuels Office. The program will be put into effect only if the coal supply system breaks down under the stress of war pressure and shortages threaten to impede operations of essential war plants or to cause civilian suffering.

Maximum Coal Price Regulation

Approval of the Emergency Price Control Act of 1942 on January 30 opened a new field for the Division's participation in prosecution of the Nation's coordinated war effort. Through an exchange of letters between Secretary Ickes and Price Administrator Leon Henderson, the groundwork was laid for cooperation between the Division and the Office of Price Administrator in taking steps necessary to prevent war-time inflationary prices for bituminous coal.

Accordingly, a plan was developed whereby the Division recommends to the Price Administrator suitable action under powers vested in his office by the Emergency Price Control Act with reference to control of maximum bituminous coal prices charged by producers, distributors, and sales agents. The plan was devised under section 201 (a) of the Price Control Act, which provides that the Price Administrator may utilize the services of other Federal agencies in administering the act. In order to discharge its recommendatory function, the Division was empowered to conduct hearings, conferences, and handle necessary correspondence.

The first fruits of this cooperative arrangement was establishment of Maximum Price Regulation No. 120, setting up maximum prices for producers, sales agents, and distributors on deliveries from mines and preparation plants. Participation of the Division in its establishment is described in the regulation itself, as follows:

At the request of the Price Administrator the Bituminous Coal Division, United States Department of the Interior, has cooperated with the Price Administrator in the formulation of the maximum prices established by this regulation in accord-

ance with the arrangement effectuated by the letters dated March 9 and 13, exchanged between the Price Administrator and the Secretary of Interior.

As in the case of its cooperation with the Office of Solid Fuels Coordinator, the Coal Division was exceptionally well prepared to aid the Price Administrator in setting up maximum bituminous coal prices.

This was due, in a measure, to the fact that the Coal Division, at the time the Emergency Price Control Act was approved, had before it Docket No. A-983. This was a proceeding instituted on application of the Bituminous Coal Consumers' Counsel seeking establishment of maximum prices under provisions of the Bituminous Coal Act. The Acting Director ruled continuation of these proceedings was unnecessary, but instructed the Division staff to proceed with a careful study of all materials presented and filed.

OPA Aided By Division

These and other voluminous data in the Division files concerning costs of production and invoice prices were made available for use in formulating the maximum prices established under Regulation No. 120. The regulation itself leans heavily upon the size groupings and classifications set up in the minimum price schedules established by the Coal Division, and the minimum price schedules lent a systematic pattern for formulation of a readily comprehensible set of maximum prices for coal delivered from the mine. In addition, Regulation No. 120 contains many provisions designed to assure that the maximum price regulation will be consistent with the minimum prices and marketing rules and regulations.

In addition, the Division was consulted in respect to Maximum Price Regulation No. 122, which governs bituminous coal delivered from docks, yards, and terminal facilities. In connection with this regulation, Division technicians made two studies: One concerned the interrelationship between Regulation 120 and 122. The other dealt with the interrelationship between Regulation 122 and Bituminous Coal Division regulation over minimum prices and marketing rules and regulations applicable to distributors, including dock operators. Various suggestions offered by the Division were utilized in the final form of the regulation.

It was upon advice of the Division that OPA granted a request from the War Department that Alaska be deleted from the maximum price schedule.

Division Investigates Violations

However, the responsibility of the Bituminous Coal Division in prevention of wartime inflationary bituminous coal prices is not dis-

charged merely by furnishing the Price Administrator with economic data and technical advice on the bituminous coal industry. In the agreement between the Secretary of the Interior and the Price Administrator the task of detecting and investigating violations of Maximum Price Regulation No. 120 was assigned to the Division.

This arrangement, including recommendations to OPA as to the application of appropriate measures, was consummated because the Division had a compliance staff with the specialized training needed for the task. The arrangement likewise obviated the possibility of overlapping activities by the two Federal agencies. As the fiscal year concluded, this additional and important work had been assumed by a compliance staff fully aware of the extensiveness of the undertaking. As of June 30, 1942, there were 186 cases involving violations of Maximum Price Regulation No. 120 under investigation by the Division.

Division Recommends Amendments of Maximums to OPA

Still another important task devolves upon the Division in connection with establishment, enforcement, and maintenance of wartime maximum bituminous coal prices for mine shipments. It is called upon to consider and make recommendations concerning the many requests for relief by way of adjustment, exception, or amendment from the maximum prices or accompanying regulations.

These requests for relief from persons affected by the regulation, are made in petitions or protests filed in accordance with Procedural Regulation No. 1 of the Office of Price Administration. When filed with OPA, the protests or petitions are docketed and referred to the Division where they are processed and analyzed in the light of data available to the Division and the coal needs of the Nation.

On the basis of such study the Division recommends to the Office of Price Administration the disposition it believes should be made of the petition or protest.

Cooperation With Other Agencies

With the advent of war, the Division, in addition to duties imposed by statute or arrangement, has developed a highly important function as a service unit for other war agencies and departments of the Government. This is especially true of the relationship between the Division and the Departments of War and Navy, the War Production Board and its various subdivisions.

The Under Secretary of War, the Quartermaster General, and other high officials of the War Department and of the Navy Department as well, have frequently sought from the Division, especially the Mar-

keting Branch, its technical advice and assistance. Many of their problems concerned availability of coal of various types for Army and Navy concentrations, its qualitative value, price at the mines, freight rates, and other questions of supply.

Because of the threatened shortage of other fuels, the War and Navy Departments have urged use of coal for power upon many plants being constructed for war goods production. The Departments have called upon the Marketing Branch to recommend sites for these plants with reference to readily available supplies of suitable coal.

The problems upon which technical advice has been sought and received from the Division went farther afield than coal availability. For example, they include such diversified matters as discussions with War Production Board officials on proper coals for steel making and with the Chemical Warfare Service on properties of fly ash. Explosive plants, arsenals, the Treasury Department, the Post Office Department, Rural Electrification and the Interstate Commerce Commission are among other Government agencies which the Division has supplied with technical information.

The Division has granted a request advocated by the Consumers Counsel that the War Department temporarily be exempted from a marketing rule that requires purchasers to pay interest on past-due transportation charges prepaid on coal shipments by code member producers and registered distributors. At the request of the War Department the Division likewise facilitated establishment of new transportation facilities for war materials from the Huntsville Arsenal. This was done by establishing minimum prices to permit shipment of coal in barges via the Tennessee river from "truck mines" in the Tennessee-Georgia field. This action was sought by the War Department chiefly to render feasible development of interrelated barge shipments of coal and other raw products to, and the processed goods from, the Huntsville Arsenal and a nearby Army fabricating plant.

Administration of Regulatory Functions

The Bituminous Coal Act of 1937 was designed to free one of the Nation's most vital industries from a savage competitive warfare which was rapidly dissipating its \$2,500,000,000 investment, plunging many of its 500,000 miners into dire poverty, impoverishing entire sections of the country, and causing serious dislocations in the whole economy of the country.

These grievous conditions did not arise overnight. They stemmed largely from World War I which saw a vast expansion in the productive capacity of the bituminous mines. This was due partly to increased fuel requirements for war goods manufacture. In part it was due to attempts to make up deficiencies of supplies at various points of consumption caused by transportation shortages.

After the war, however, demand and potential supply were thrown far out of adjustment. Although manufacturing remained at a high peak, demand for bituminous coal lessened year by year. This situation was caused by increased efficiency in the use of coal coupled with growing competition from other fuels.

The excess capacity created by lessened demand led to lowered prices which were often below the cost of production. Producers sold their coal for what they could get in the wholly human hope of "weathering through" until markets improved.

In consequence, the era of prosperity enjoyed by other industries from 1923 to 1929 found a sad contrast in the bituminous coal industry. They were years of mounting losses to coal producers, which were heightened in the depression years which followed. In 1929 the industry produced 525,000,000 tons of coal but suffered a net loss of \$11,822,033. In 1932 the net loss was \$51,167,000.

Need of Regulation Obvious

It became obvious that in the absence of some regulation the Nation soon would lose its chief source of energy or find it controlled by the few financially able to survive the destructive competitive price war.

To obviate what threatened to be a major blow to American industry, the Congress enacted a statute under which are established minimum prices designed to return to producers a realization which approximates the weighted average costs in their respective areas.

The law established the framework of a public policy within which the industry could function efficiently in the interests of the producers, miners, and the consuming public. This was the objective of the coal act, rather than any attempt at coercive interference with coal producers. The Supreme Court, in an opinion holding the act constitutional said, "The history of the bituminous coal industry is written in blood as well as in ink . . . If the strategic character of this industry in our economy and the chaotic conditions which have prevailed in it do not justify legislation, it is difficult to imagine what would."

Providentially these "chaotic conditions" were removed by the operation of the act long enough in advance of America's full swing into the war to permit producers to strengthen themselves sufficiently financially to undertake the all-out production demanded. They likewise were able to throw their resources into production with the comforting assurance that the minimum price structure would provide them realization on sales at least approximately equal to weighted production costs and protect them against price cutting.

In addition to the benefit of stabilization through operation of minimum price schedules, the industry has enjoyed in many markets increased consumer requirements for coal and consequent price in-

creases for certain grades and sizes because of the huge war goods manufacturing program.

Regulatory Structure Still Required

Wartime price improvement is not regarded by Division economists and marketing experts as any valid reason for relaxation of the market regulatory structure which brought about and is maintaining stabilization.

Statistical studies made during the fiscal year showed that some coal still was competing in various markets at prices close to the minima established under the act. The obvious inference was that this competition would have resulted in prices for this coal which were below the cost of production, in the absence of any regulatory structure. In addition, there are certain competitive factors peculiar to, and variables inherent in the coal industry which often act as disturbing forces on parts of the market when there is a rising demand in another. The only effective control over these factors ever devised is minimum price schedules.

For instance, requirements are never uniform through the range of sizes and qualities of coal. The mine owner, in producing the size for which there is need often must, of necessity, produce sizes for which there is little or no requirement. Since it is generally economically unfeasible to maintain storage at mines, the slower moving sizes are loaded into whatever cars are available where they clog up tracks and hamper movement of sizes for which there is a ready sale. Until establishment of minimum price schedules it had been the historic custom of the coal industry to dump this coal at any price obtainable, regardless of production costs. However, what was a "dumped" size for one producer may have been a major size for another so that in the maze of sales the price level was influenced strongly by the quotations on the distressed residuals. With transportation facilities dwindling day by day and requirements centering more and more on industrial sizes, it is obvious that this dumping practice would be resumed upon any relaxation of the act's regulatory features.

Fluctuations in Production

One of the variables with which the coal industry must contend is low production in the summer season. This may be illustrated by observing the 3 years of 1936, 1938, and 1940. During each of these 3 years production was not seriously interrupted by stoppages due to strikes. Considering the average monthly production in these 3 years as 100 percent, the average January production in the United States was 113 percent, while the average April production was 83 percent,

with averages for May and June at about the same level as April. The average December production was 121 percent. Low summer production was most marked in District 14 (Arkansas-Oklahoma) where the average January production was 183 percent, with the averages for April and May being 23 and 24 percent, respectively.

Another variable is week by week production in any season. For example, the production of the week ended July 5, 1941, was only 61.2 percent that of the previous week and only 70.9 percent that of the following. Production for the week ended September 20, 1941, was 90 percent that of the previous week and 90.7 percent that of the following. With both winter and the war effort in full swing, production for the week ended January 3, 1942, was only 88.7 percent that of the following week.

It is obvious that such extreme fluctuations in production result in periodic surpluses. It is a fair assumption that, in the absence of minimum price schedules, these surpluses would be disposed of by the price cutting technique which brought about the chaotic conditions from which the industry suffered for more than two decades.

The history of the bituminous coal industry, "written in blood as well as in ink," records its plunge into chaos when its economy was disrupted by the cataclysm of World War I. The bituminous coal industry, however, has in the Bituminous Coal Act of 1937 a tested bulwark to protect it now and in the approaching period of reconstruction against such a buffeting as it suffered as a result of the last war.

Adjustment of Minimum Prices

The period covered by this report saw the conclusion of the first phase of a proceeding, designated as General Docket 21,³ instituted by the Division to determine whether or not production costs had changed sufficiently to make appropriate a general revision of minimum price schedules. Adjustment of effective minimum prices is required by the statute whenever it is determined that the weighted average costs of the producing industry have changed in excess of 2 cents per ton in any minimum price area.

The first phase of the proceeding dealt solely with determination of cost changes in various price areas throughout the Nation. The Acting Director issued determinations that costs had increased in virtually all minimum price areas and that the weighted average increase for the Nation was 10.63 cents a ton. The findings were reviewed and affirmed by Secretary of the Interior Ickes, whereupon

³ Since the conclusion of the fiscal year, Trial Examiner Floyd McGown, who heard the proceeding, made his report and recommendations to Acting Director Dan H. Wheeler of the Bituminous Coal Division. Acting Director Wheeler received briefs, heard oral arguments, and on Aug. 28, 1942, issued an order, effective Oct. 1, 1942, establishing minimum prices which represented increases in minimums of 5 to 30 cents for various designated areas.

the second phase of the proceeding was initiated. The second phase looked toward revision of minimum price schedules as required by the statute in view of the change in costs, and was still in process at the close of the fiscal year.

Aside from changes in the costs used in formulating minimum prices, there are constant changes in other factors affecting the marketing of coal that require constant adjustments to minimum price schedules and marketing rules and regulations. To make possible the maintenance of the regulatory structure on a sound basis, the Congress expressly provided for ready adjustment in section 4 II (d) of the Bituminous Coal Act. It authorizes the filing with the Division of petitions seeking modification of the effective minimum price schedules and the Marketing Rules and Regulations. Code members, district boards, the Bituminous Coal Consumers' Counsel, and governmental subdivisions have availed themselves freely of this privilege of petition.

Price Adjustment Petitions Lessen

In the 9 months elapsing between establishment of minimum price schedules and Marketing Rules and Regulations on October 1, 1940, and June 30, 1941, 944 petitions were filed under this section. They sought either supplementation or revision of effective minimum price schedules and Marketing Rules and Regulations. During the entire fiscal year ended June 30, 1942, only 572 petitions were filed. The majority of these were requests for the establishment of minimum prices for new mines, additional minimum prices for new sizes produced by old mines, additional minimum prices for rail shipments from mines which had formerly shipped only by truck, and new or additional loading points for mines already shipping by rail. Thus it may be seen that the majority of petitions stemmed from developments in business rather than objection to minimum prices already established.

Of the 1,516 petitions filed from October 1, 1940, to June 30, 1942, all but 10 had been acted upon in an appropriate manner by the latter date and 909 had been disposed of finally by order or memorandum.

When numerous petitions were filed for adjustment of the complex price structure immediately after establishment of minimum prices and Marketing Rules and Regulations in October 1940, the Coal Division deemed it necessary to give full opportunity to all parties to present evidence concerning their complaints. Hearings were held in virtually all 4 II (d) proceedings except when the parties interested waived them. As a result of those hearings, the Coal Division has devised appropriate methods for expediting adjustment of established price structure to reflect the continual changes in the coal industry. It is now possible to curtail greatly the number of hearings.

Requests for the establishment of new prices for new mines, for revisions in established prices, for establishment of new prices for newly prepared sizes at old mines, for establishment of new loading points, have been ruled on when possible without formality of oral hearings. On the basis of affidavits from petitioners and others interested in such cases, the Coal Division has endeavored to dispose of requests for adjustment by orders granting temporary relief. These orders provide conditionally for final relief to become effective 60 days from the date of the order. Wide opportunity is given anyone interested to object and be heard. Thus in 568 out of the 1,516 proceedings conducted under section 4 II (d) such temporary and conditionally final orders were issued.

River Transportation Problem

Several proceedings have arisen which involve controversial problems arising out of the river transportation of coal in relation to coal transported by railroad or other means. Among them is one affecting the Cincinnati, Ohio, market area, which still was pending at the end of the fiscal year. The Cincinnati area consumes annually approximately one and a half million tons of coal shipped via the Ohio River and one and a half million tons of coal shipped by rail, largely from the high volatile producing field in District No. 8. In view of the many complaints particularly from retailer dealers and retail dealer associations in Cincinnati, the Coal Division, in January 1942, initiated a proceeding, known as Docket No. A-1239, in order to determine the exact nature of the problems affecting the Cincinnati area insofar as the shipment of bituminous coal and resale of such coal in that area were concerned, and looking toward a solution. The hearing in that proceeding lasted for approximately 8 weeks, when, because of the difficulty in procuring cost figures from producers shipping by river and from retail dealers allegedly adversely affected by the minimum prices established by the Division, the hearing was temporarily adjourned. The failure of several persons to produce materials required under a subpoena issued by the Acting Director made necessary the institution of a court proceeding, which is still pending. As a result of initiation of the court action, however, negotiations have been conducted with the persons affected with a view toward procuring the necessary cost material without recourse to a court order.

Compliance Under Coal Act

To an extent as great as possible with the limitations of the staff available, the Division has checked carefully the market activities of

companies subject to the Bituminous Coal Act to prevent violations of minimum prices, the Marketing Rules and Regulations and orders. A review of the numerous checks leads to the conclusion that the pledges of compliance have been kept faithfully by the preponderance of the industry and that the disastrous marketing conditions and practices which the Congress desired to prevent have been eliminated.

However, the magnitude of the task of checking compliance can be appreciated only on the basis of full knowledge of the various channels and methods used in marketing bituminous coal, the standardized nature of the product, and of the multiplicity of trade practices formerly prevalent in the industry. The scope of the undertaking may be indicated, however, by noting that bituminous coal is sold by more than 17,000 companies or individuals, while producers, sales agents, or distributors have agreed to observe the regulations.

It is reasonable to assume that under less favorable market conditions than those prevalent during this fiscal year there may have existed a greater incentive to sell coal at less than the minimum price and engage in unfair methods of competition.

The general conclusion, that for the most part, compliance pledges were kept faithfully is not meant to indicate a condition approaching total absence of violations. Despite the upward trend of prices generally, great quantities of bituminous coal have competed in the market at prices approximating the minimum. As might be expected, this has been particularly true of low grade coals. Such competition also results from the inability of the mine operators to produce particular sizes of coal in a volume proportionate to market demand for those sizes without also producing residuals for which at times there is no corresponding demand. The compliance staff, with the cooperation of the District Boards, has uncovered numerous instances of violation as a result of these conditions and the sanctions provided in the act and the regulations have been imposed on violators.

Penalties provided for producers include the revocation of membership in the code with a condition of restoration being the payment of a tax of 39 percent of the sale or minimum price to the United States Treasurer, or else orders directing the producer to cease and desist from further violations. Applications may be made by the Division to the Circuit Court of Appeals of the United States to enforce such orders. The penalty provided for distributors, acting as such when purporting to act as sales agencies, is suspension or revocation of their registration thereby depriving them of the privilege of receiving a discount from the minimum price when purchasing coal from the producer.

Procedure in Violation Cases

When checks of records of companies disclose what seems to be wilful violations, steps are taken to set such matters for hearing. If evidence and testimony at the hearings lead to the conclusion that wilful violations have been committed, appropriate orders are issued imposing the sanctions.

During the fiscal year 829 such investigations have been completed, 13 hearings have been held and 232 orders imposing the penalties under the act and rules and regulations have been issued. Of these orders 103 directed producers to cease and desist from further violations; 95 revoked the code membership of producers, the restoration of which was conditional upon the payment of taxes ranging from moderate sums up to \$12,000.14 and totaling \$89,072.41; 29 suspended the registration of distributors from 30 days to 9 months and 10 revoked the registration of distributors.

Of the 232 compliance orders, 35 were entered without formal hearing pursuant to the Division's procedure under which compliance proceedings may be disposed of without formal hearing on the basis of an application filed by the alleged violator. At the close of the fiscal year 497 investigations were in process and 122 hearings had been held as a result of which final orders had been entered.

A great many investigations disclosed violations which did not seem to be wilful or circumstances which made it inadvisable to institute formal compliance proceedings. In such cases the Division usually disposed of the matters informally. Often it required sales agents and distributors to render corrected invoices for the full minimum price or required sales agents and distributors to refund unlawful allowances received by them from producers.

Litigation

Only two important court decisions were rendered during the year directly affecting the Coal Division. One of these, a decision by the United States Supreme Court, is regarded as a milestone in the field of judicial review of administrative adjudications.

Seaboard Air Line Case

On December 15, 1941, the Supreme Court, with three justices dissenting, rendered its opinion in *H. A. Gray et al. v. Legh R. Powell, et al.* No. 18, October Term, 1941, reversing the Circuit Court of Appeals for the Fourth Circuit and upholding the Division's order denying the Seaboard Air Line's petition for exemption from mini-

imum price regulation.⁴ The railroad had contended that under section 4 II (1) of the coal act exempting coal consumed by the producer thereof, it was entitled to an exemption in the situation where it had leased coal lands and entered into agreements with three independent contractors to mine coal for petitioners. In upholding the Division's order the Supreme Court stated the determination of who is the "producer" is a matter for the expert and informed judgment of the body entrusted with the administration of the act.

The Midland Cooperative Case

The Director's interpretation of the unfair trade practice provision of the act was upheld in all respects by the Circuit Court of Appeals for the Eighth Circuit in *Midland Cooperative Wholesale v. Harold L. Ickes and H. A. Gray*, No. 12,085, November Term, 1941.

The case was instituted by a petition filed by Midland Cooperative Wholesale to review an order of the Director which held that the Midland Co. could qualify to receive discounts from the minimum prices only with respect to that coal which it purchased for resale to bona fide and legitimate farmers' cooperatives. Petitioner, however, contended that (1) the permission granted to "farmers' cooperatives" in the last paragraph of section 4 II (i) of the act was intended by the Congress to be extended to all types of cooperative organizations and (2) that the distribution by it of patronage dividends did not disenable it from qualifying as a distributor.

In an opinion in which the Division's brief is quoted at length, the court ruled that the Director was correct in ruling that Congress had not intended to extend to consumer cooperatives the same privileges it had extended to farmers' cooperatives. It also ruled that the Director had correctly found that petitioner could not qualify as a distributor since in its capacity as a "purchasing agent" for those of its member associations which were not farmers' cooperatives, it was an "instrumentality of retailers" within the meaning of paragraph 12 of section 4 II (i) of the act and was therefore prohibited from receiving discounts from the established minimum prices.

Petitioner's request for certiorari was denied by the Supreme Court on April 27, 1942.

Miscellaneous

On November 28, 1941, Wheeling Valley Coal Corporation, et al., code members in District No. 6, filed a petition with the Circuit Court of Appeals for the Fourth Circuit to review an order of the Director

⁴ The decision was rendered as a result of a reargument of the case before the court, the court having previously (Mar. 31, 1941) by an evenly-divided vote upheld the decision of the Circuit Court of Appeals for the Fourth Circuit.

which denied the request to establish special "ex-river" prices on shipments of coal to certain northern Ohio market areas. Subsequently petitioners filed a motion for leave to apply to the Division to reopen the matter before it. The court granted such leave and petitioners on July 24, 1942, after filing a petition to reopen the cause with the Division pursuant to leave of the Division, filed a motion to dismiss its petition with the court.

On January 26, 1942, the Circuit Court of Appeals for the Seventh Circuit granted the Division permission to intervene in the case of *Bell & Zoller Coal Co. v. Wilson & Co., Inc.*, a proceeding instituted by the Bell & Zoller Coal Co., a code member, to recover the difference between the minimum price and the contract price for certain coal shipped after October 1, 1940, pursuant to a contract entered into prior thereto which provided for a sale price below that established as the minimum price. In resisting payment, the defendant contended that the price provisions of the act could not lawfully be made applicable to coal moving wholly within the State of Illinois and attacked the validity of an order entered earlier by the National Bituminous Coal Commission ruling that all commerce in bituminous coal within Illinois directly affects interstate commerce.⁵

On March 4, 1942, a suit was filed in the Circuit Court of Appeals for the Sixth Circuit by Edwin R. Eberhart, a code member, to review an order entered by the Acting Director revoking and canceling Eberhart's code membership and for a stay of the effective date of that order. The court first granted the stay and thereafter, upon motion of the Division, modified the stay order by adding a condition that pending final disposition of the petition for review, Eberhart was not to sell coal in violation of the price requirements of the act. On May 6, 1942, the court, acting on stipulation of counsel, dismissed the proceeding and vacated the stay order.⁶

On May 19, 1942, the city of Indianapolis filed with the Circuit Court of Appeals for the Seventh Circuit a petition to review an order of the Acting Director denying the city an exemption from the act with respect to the mining operations of its wholly-owned subsidiary, Milburn By-Products Co. Petitioner's request for a stay of the Acting Director's order was denied by the court but the case has not yet been considered on the merits.

On May 23, 1942, the Ozark Coal Co. filed a petition with the Circuit Court of Appeals for the Sixth Circuit seeking a review and reversal of an order establishing prices for the coals produced by the company at its Arkansas mine. The cause has not yet been scheduled for argument.

⁵ On Aug. 10, 1942, on stipulation of counsel an order was entered in favor of the plaintiff for the full amount of the difference between the established minimum price and the contract price.

⁶ Eberhart's code membership was reinstated upon payment of a tax in the amount of \$4,648.41 as provided in section 5 (c) of the act.

Office of Solid Fuels Coordinator for War

HOWARD A. GRAY, Deputy Coordinator

THE adequacy of the coal supply is a matter of much concern to the Nation in time of war. Coal is the basic source of heat and power for industrial and household uses, and, certain kinds are necessary for the manufacture of steel, rubber substitutes, explosives, and other military and civilian goods.

The war has exposed the coal supply to many difficulties and disruptions. The production of war goods, military activities, and their repercussions are substantially reducing the availability of manpower and necessary materials used in coal mining. Coal production requires much highly trained labor, men of military age and physical fitness, and huge quantities of such critical materials as steel, copper, rubber, and heavy machinery.

One of the most important elements bearing upon the coal supply that is being affected by the war is transportation. The movement of coal is the biggest job entailed in transporting any single commodity. The railroads normally carry approximately 85 percent of the supply some part or all of the way from the mines, over distances often long and through regions of congested rail traffic. Heavy tonnages are moved also by ocean shipping, inland waterways, and motor trucks, each offering its own peculiar wartime problems.

The war has increased the burden upon the transportation system enormously, but limitations of manpower, time, and materials have prevented a corresponding increase in transportation facilities.

In a letter dated November 5, 1941, requesting the Secretary of the Interior to serve as Solid Fuels Coordinator, President Roosevelt wrote as follows:

As the defense effort progresses it becomes increasingly urgent to assume that the supply of solid fuels will be adequate and that they will be readily available at consuming points when required for military, industrial, and civilian purposes. Difficult problems are already arising with respect to their supply and availability for such uses. These problems require the efficient and carefully coordi-

nated development, production, distribution, utilization, transportation, and handling of solid fuels.

A short time after the Secretary of the Interior took over these new responsibilities, the Office of Solid Fuels Coordination was established. On May 25, 1942, the name was changed, by direction of the President, to the Office of Solid Fuels Coordinator for War.

Rather than build a large, new organization, whose work would duplicate part of that normally carried on by the Bituminous Coal Division and the Bureau of Mines, the staffs of these agencies and much valuable information in their possession were made available to the new office. The staff of the Solid Fuels Office was held to a minimum. This saved much money, and enabled the Coordinator to begin functioning effectively almost at once.

Immediate steps were taken to organize the several industries dealing with the coal supply on a war basis, and to establish channels of communication between them and the Government to facilitate expeditious and effective action. The industries cooperated heartily in this undertaking. In response to the Coordinator's invitation, representatives of the bituminous and anthracite mining industries, coal transporters, distributors, dealers, and mine labor met with him on December 18, 1941, at Washington, D. C., where the ground work for organizing the industries was laid. As a result, there was established an Industry Committee on Solid Fuels, whose 18 members represent the various industries concerned, and mine labor and the public. This group, which later was named the Solid Fuels Advisory War Council, meets regularly each month (or upon call), and discusses in detail the various problems affecting or threatening the supply of coal, coke, and other solid fuels.

Estimates, made early in 1942 with the aid of the Bituminous Coal Division and the Bureau of Mines, indicated that the Nation would require between 550,000,000 tons and 570,000,000 tons of bituminous coal, approximately 60,000,000 tons of anthracite, and about 70,000,000 tons of coke during the calendar year of 1942. This would be the largest bituminous production since 1926, the largest anthracite in over a decade, and the greatest output of coke in history. Later experience indicates that these early estimates are in line with actual requirements.

In view of disruptions and difficulties caused by the war, and the large increase in fuel needs, it will require careful planning and organization of production, transportation, and distribution to assure that the supply of coal and coke will be adequate where and when needed in 1942. After establishment of the Solid Fuels Office, no time was lost in beginning this task.

By the close of the fiscal year, it appeared that unless unforeseen difficulties occur, the steps taken to protect the solid fuel supply will

THE adequacy of the coal supply is a matter of much concern to the Nation in time of war. Coal is the basic source of heat and power for industrial and household uses, and, certain kinds are necessary for the manufacture of steel, rubber substitutes, explosives, and other military and civilian goods.

The war has exposed the coal supply to many difficulties and disruptions. The production of war goods, military activities, and their repercussions are substantially reducing the availability of manpower and necessary materials used in coal mining. Coal production requires much highly trained labor, men of military age and physical fitness, and huge quantities of such critical materials as steel, copper, rubber, and heavy machinery.

One of the most important elements bearing upon the coal supply that is being affected by the war is transportation. The movement of coal is the biggest job entailed in transporting any single commodity. The railroads normally carry approximately 85 percent of the supply some part or all of the way from the mines, over distances often long and through regions of congested rail traffic. Heavy ton-nages are moved also by ocean shipping, inland waterways, and motor trucks, each offering its own peculiar wartime problems.

The war has increased the burden upon the transportation system enormously, but limitations of manpower, time, and materials have prevented a corresponding increase in transportation facilities.

In a letter dated November 5, 1941, requesting the Secretary of the Interior to serve as Solid Fuels Coordinator, President Roosevelt wrote as follows:

As the defense effort progresses it becomes increasingly urgent to assume that the supply of solid fuels will be adequate and that they will be readily available at consuming points when required for military, industrial, and civilian purposes. Difficult problems are already arising with respect to their supply and availability for such uses. These problems require the efficient and carefully coordi-

ated development, production, distribution, utilization, transportation, and handling of solid fuels.

A short time after the Secretary of the Interior took over these new responsibilities, the Office of Solid Fuels Coordination was established. On May 25, 1942, the name was changed, by direction of the President, to the Office of Solid Fuels Coordinator for War.

Rather than build a large, new organization, whose work would duplicate part of that normally carried on by the Bituminous Coal Division and the Bureau of Mines, the staffs of these agencies and much valuable information in their possession were made available to the new office. The staff of the Solid Fuels Office was held to a minimum. This saved much money, and enabled the Coordinator to begin functioning effectively almost at once.

Immediate steps were taken to organize the several industries dealing with the coal supply on a war basis, and to establish channels of communication between them and the Government to facilitate expeditious and effective action. The industries cooperated heartily in this undertaking. In response to the Coordinator's invitation, representatives of the bituminous and anthracite mining industries, coal transporters, distributors, dealers, and mine labor met with him on December 18, 1941, at Washington, D. C., where the ground work for organizing the industries was laid. As a result, there was established an Industry Committee on Solid Fuels, whose 18 members represent the various industries concerned, and mine labor and the public. This group, which later was named the Solid Fuels Advisory War Council, meets regularly each month (or upon call), and discusses in detail the various problems affecting or threatening the supply of coal, coke, and other solid fuels.

Estimates, made early in 1942 with the aid of the Bituminous Coal Division and the Bureau of Mines, indicated that the Nation would require between 550,000,000 tons and 570,000,000 tons of bituminous coal, approximately 60,000,000 tons of anthracite, and about 70,000,000 tons of coke during the calendar year of 1942. This would be the largest bituminous production since 1926, the largest anthracite in over a decade, and the greatest output of coke in history. Later experience indicates that these early estimates are in line with actual requirements.

In view of disruptions and difficulties caused by the war, and the large increase in fuel needs, it will require careful planning and organization of production, transportation, and distribution to assure that the supply of coal and coke will be adequate where and when needed in 1942. After establishment of the Solid Fuels Office, no time was lost in beginning this task.

By the close of the fiscal year, it appeared that unless unforeseen difficulties occur, the steps taken to protect the solid fuel supply will

make it possible to provide sufficient coal of some kind, quality, or size to keep homes warm and factories running throughout the winter of 1942-43. However, in order to enable mines and carriers to supply the coal it will be necessary for dealers and consumers to order their fuel early enough to enable the mines and carriers to have full use of their limited manpower and equipment during the summer. This is necessary to reduce the fall peak in coal shipments to a size that will not overburden facilities, and to provide sufficient storage of coal in consumers' bins to protect them against any local emergencies or delays in shipments that otherwise might catch them without adequate fuel.

To bring about public cooperation in this task, the Solid Fuels Office, in cooperation with other Government agencies and industry, launched a "Buy Coal Now" campaign in the Spring of 1942. At the close of the fiscal year, consumers were cooperating heartily.

Both bituminous and anthracite coals were being produced and transported at a rate much higher than normal seasonal requirements, and, generally speaking, production and transportation were functioning relatively smoothly in light of war difficulties. The bituminous output was averaging well above 11,000,000 tons per week and anthracite was flowing in excess of 1,000,000 tons per week. Although the bituminous mines could supply much more, the anthracite mines were working at near capacity, due to the handicap of the results of a flood during the Spring. Ample transportation was available.

A great deal of this fuel was going into dealers' and consumers' storage. The amount of bituminous held in storage totaled 73,268,000 tons as of June 30, 1942, and was expected to exceed all past records in history before the end of the year. No records were available as to the amount of anthracite in storage, but factors indicated that it was high.

The production of bituminous coal during the first half of 1942 was estimated at 284,808,000 tons, or more than half of the year's anticipated requirements. Anthracite production for that period was estimated at 29,507,000 tons, or close to half of the year's expected requirements.

In addition to the summer coal storage drive, the Coordinator's office was engaged in numerous other activities designed to assure an adequate supply of coal, coke, and other solid fuels. Among them were:

1. A survey of the Nation's coal requirements, and of actual and potential mine production capacity. Although helpful preliminary information is now available from both studies, the latter one is not completed.
2. Studies of the adequacy of coal stocks held by consumers. Most of these investigations were carried out with the aid of the Bituminous

Coal Division and the War Department, and a survey of stocks held by war industries and the railroads was made in conjunction with the War Production Board. Wherever large war industry consumers or railroads were found to have insufficient coal on hand, they were advised to build up stocks. Essential consumers and war industries were advised to store sufficient coal to last from 90 to 120 days. Other industries were advised to store an average of 60 to 90 days' supply.

3. The planning and recommendation of emergency coal movements in various areas to supplement disrupted or deficient transportation via normal routes, or the inability of normal sources to supply wartime needs in various areas. It was necessary to arrange for emergency routing of coal, particularly to New England, to make up for the loss of colliers. Also, it was necessary to transfer heavy tonnages to all-rail routes to certain areas along the lower Great Lakes as a result of the diversion of lake colliers from coal to other war service. In other instances, the necessity for arranging supplemental movements into certain Midwestern areas and into the States of Washington and Oregon to make up for a deficiency in production capacity in the mines normally serving those areas is under study.

4. Survey of the availability of mine labor and consultation with the Selective Service System and the War Manpower Commission in effort to protect the mine labor supply. Preliminary studies indicate that the mines have suffered a net loss of upward of 40,000 workmen in the first half of 1942, because of the effects of the war.

5. Investigation of the need for priorities to enable producers to obtain necessary critical materials used in mining.

6. Studies of coke requirements, and the recommendation of necessary steps to assure sufficient coke to meet steel manufacturing needs. It appears that all coke requirements can be met, barring unforeseen difficulties, although a situation wherein the supply of low-volatile coking coals is tightening is being carefully watched.

7. Formulation of a proposed emergency distribution system for recommendation to the appropriate Governmental authority for establishment if and when necessary. The work of formulation is well under way.

War Resources Council

STEPHEN RAUSHENBUSH, Acting Director

ON December 7, 1941, the Secretary of the Interior put all employees and all bureaus of the Department on a war emergency basis. He established a War Resources Council, with Michael W. Straus as Director, to expedite this policy, and approved a war program to serve in mobilizing strategic natural resources of the Nation on the scale made necessary by global warfare. It has as its aim the supplying of essential raw materials, ores, minerals, metals, fuels, and power to the industrial processors and fabricators in order to attain the national war production goals set by the President. The Department and all of its agencies are devoting the full knowledge and experience gained through years of development, conservation, and study of these natural resources to the winning of the war. The council has been called upon to help in developing many parts of the program, and in coordinating the work of several bureaus.

Metals for War

Machines have made this war unique and have raised metals to first rank among essential war materials. Years of exploration and experiment have prepared the Bureau of Mines and the Geological Survey to move the country forward toward production on a victory scale by turning known but unused, low-grade materials into metals. The Department has begun to secure the immediate use of new processes tested in its own laboratories which can supply enough manganese to make 87 million tons of steel annually from low-grade domestic manganese ores. Its program is: To give all aid possible toward the establishment of plants using the Department's improved acid process for producing aluminum; to make available its magnesium processes utilizing domestic ores; to complete and secure the prompt use of a process for producing half a million tons of chromium concentrates annually from low-grade chromium ores; to develop a sponge iron program to meet the Nation's deficiency in scrap metal; to carry

explorations for copper, lead, zinc, iron, chromite, aluminous clays, vanadium, tungsten, and mercury to the point of action; to furnish the War Production Board as needed with a ranking of the best possible new developments of all critical ores; to formulate for it a domestic ore-buying program, and to stand ready to supervise it if requested.

Oil for War

Without petroleum products, the war machine of the United States and the United Nations could not function. Preparations to meet the challenge were made through the Office of the Petroleum Coordinator for War. This organization, although not a part of the Department of the Interior, was placed under the leadership of Secretary of the Interior Harold L. Ickes as Petroleum Coordinator. Its functions are among the most important of war activities, as the organization was charged with assuring an adequate supply of petroleum for both military and civilian use. While not an agency of the Department, the importance of its functions merit recognition in any discussion of the war responsibilities of the Secretary of the Interior.

The Office of the Petroleum Coordinator for War organized, through the industry, petroleum production based upon sound engineering techniques, stimulated exploration for new reserves. Its program is: To multiply the industry's capacity to manufacture high-octane gasoline; to establish new and more effective transportation methods required in moving blending stocks for aviation gasoline; to reshape the complex transportation system of the oil industry by substituting tank cars, trucks, barges, and pipe lines for tankers diverted to war service; to aid in marketing, and in the manufacture of rubber ingredients, and of toluene; to aid in a drilling campaign, and to aid in the production, handling, and transportation of petroleum products.

Power for War

The war budget of 56 billion dollars will require 154 billion kilowatt-hours of electric energy annually for the manufacture of airplanes, tanks, guns, warships, and fighting material. The Department is the major producer of power in areas where the principal undeveloped resources are located. Units recently completed at Boulder, Bonneville, and Grand Coulee Dams now make the Department ready to produce at the rate of more than 7 billion kilowatt-hours annually. The Department has begun to triple the 1941 output of producing agencies in the Department by the program now under way, and to add by 1945, about 1,480,000 kilowatts, with an output of 9 to 10 billion kilowatt-hours, to the power capacity now scheduled, by constructing new hydroelectric and steam plants.

Fuel for War

Coal provides half the Nation's energy, and coke fires the blast furnaces in the steel mills, and supplies many basic chemicals.

The Office of the Coordinator for Solid Fuels estimated that more than 600,000 000 tons of anthracite, bituminous, and lignitic coals were required in 1942, and 70,000,000 tons of coke. The facilities of the Department have been mobilized to see to it that an adequate supply of coals and coke is available where and when it is needed, to organize the production of coal so that sufficient quantities of necessary types and grades are available for war industries.

Its program is: To promote orderly production and distribution; to urge the maintenance of large reserves in consumers' storage; to encourage the conservation of high-grade coals for metallurgical uses; to aid users of special kinds or grades of coal; to determine minimum and maximum prices as required in the public interest; to administer the market regulatory features of the Coal Act in order to keep the bituminous coal mining industry in a sound operating condition, and to conduct a rigid mine safety inspection program for elimination of hazards.

Helium for War

Helium is a light, noninflammable war gas of which the United States Government has a world monopoly. To supply the increased demand for helium that has arisen from the war, the Department has begun to double in 1942 the record production of the 1941 fiscal year. It is making a comprehensive survey of gas fields suitable for helium production in order to select sites for additional helium plants. It is continuing research to reduce costs of production of helium.

Food for War

Adequate food is essential to success at arms. In many ways the Department contributes to the food supplies of the United Nations. It will increase these contributions. For example, the 1,921 million pounds of fishery products utilized in 1939 can be increased in a few years, without injury to the resources, to 3,582 million pounds through proper management and development.

The Department has begun to increase as required within the next few years by 1½ billion pounds, our fishing products. Its program is: To store and deliver water for the irrigation of 10,000,000 acres of land in the arid west for the production of food crops, long-staple cotton and other fibers, and rubber-bearing plants; to assure more adequate forage on Federal ranges for the 12,000,000 head of livestock grazing there, in order to increase up to 10 percent the products now

duced; to increase the production of cane and beets; to explore sources of aquatic products for use as foods, vitamin oils, and animal feeds; to augment predatory animal and rodent control work, including plague-bearing rodent control efforts, and to conduct a food-drying program to relieve demands on tin and containers.

Land, Water, Timber for War

The increased production of those war necessities which are products of the forest, of the land, and of the water is receiving careful attention in the Department which supervises and manages the Federal land estate of 283 million acres. The Department has begun to increase a billion board feet in 1942 and to a billion and a quarter in 1943, required, timber production from the Oregon and California reforested lands and from Indian reservations. Its program is: To establish a fire lookout and air-raid warning towers; to provide trained crews to combat forest fires; to assure water supplies for municipalities and military concentration; to aid road building in Alaska; to map areas of military significance; to provide hospital and other emergency facilities, together with medical staffs, along the West Coast and in Alaska; to increase the fur and wool supplies for clothing for the armed forces; to withdraw public lands and to clear them of mineral and other claims so as to permit the establishment of military ranges, airtonments, and aviation fields, and to provide special facilities for rehabilitation and recreation of members of the armed forces.

The council is now composed of Stephen Raushenbush (Acting Director); Under Secretary Abe Fortas; John C. Page, Commissioner of the Bureau of Reclamation; R. R. Sayers, Director of the Bureau of Mines; Joel David Wolfsohn, Assistant Commissioner of the General Land Office; and Walton Onslow, Acting Director of Information. H. Rutledge is Acting Director of the Western War Resources Council, with headquarters in Salt Lake City.

Petroleum Conservation Division

J. W. STEELE, Acting Director

ON April 1, 1942, the Petroleum Conservation Division began its seventh year of administration and enforcement of the Connally Act. The act, approved February 22, 1935, for a period of 2 years, extended by Congress in 1937, again in 1939, and in June 1942 made permanent, prohibits the transportation in interstate commerce of petroleum or its products produced in excess of amounts permitted by State laws.

During the fiscal year 1942, in addition to its regular functions, the Division has cooperated with other Government departments, particularly with the Office of Petroleum Coordinator, in furthering the defense effort. Monthly reports of operations received by Federal Tender Board No. 1 have proved invaluable sources of information in respect to petroleum resources.

Federal Tender Board No. 1, Kilgore, Tex., established March 1, 1935, to issue certificates of clearance on petroleum and its products moving in interstate commerce from the East Texas field, and to conduct investigations of violations of the act within and without that area, was, by an order of the Secretary of the Interior, approved by the President May 26, 1941, given supervisory authority over an additional area of 102 Texas counties, two counties of New Mexico, and the entire State of Louisiana. In this area, which comprises the major oil producing sections of the south and southwest, monthly reports of operations of producers, refiners, and transporters of petroleum are required to be filed with the Board, and subordinate offices of the Board are located at strategic points therein to investigate alleged violations of the act and to enforce the rules and regulations contained in the order of May 26, 1941.

Operations of Federal Tender Board No. 1

The order of May 26, 1941, became effective in the extended area August 1, 1941. Prior to that date, Federal Tender Board No. 1 had maintained active supervision in an area comprising two oil

fields containing 25,700 producing wells, with an average daily production of 330,000 barrels; 5 refineries, with an average daily production of 10,500 barrels; 16 casinghead gasoline plants, with an average daily production of 20,000 barrels of petroleum products. Since the Board assumed administrative jurisdiction over the extended area, active enforcement has been in effect in an area comprising 703 fields containing 71,500 wells with an average daily production of 1,650,000 barrels of oil; 70 refineries, with an average daily production of 1,480,000 barrels of oil, and 120 gasoline extraction plants with an average daily output of 96,600 barrels of petroleum products. All of the above operations are reported to Federal Tender Board No. 1 on sworn monthly reports, but certificates of clearance were required only in the designated five-county area of East Texas.

Subordinate offices of Federal Tender Board No. 1 were maintained during the fiscal year at Houston, Corpus Christi, and Midland, Tex., and New Orleans, La., within the above area, and at Wichita, Kans., outside the area.

Effective at the close of the fiscal year 1942, the requirement of certificates of clearance in the East Texas area was rescinded by order of the Secretary of the Interior, and that area will, after July 1, 1942, be included within the enforcement area designated by the order of May 26, 1941.

Criminal Investigations and Prosecutions

During the fiscal year 1942, the volume of routine investigations by the Board of producing, refining, and transporting facilities increased as a result of extension of the supervised area. In addition to these matters, eight cases of Connally Act violations under investigation on June 30, 1941, were completed, and several major investigations were initiated. Cases and investigations carried over from the fiscal year 1941 and those instituted during the fiscal year 1942 were disposed of as follows:

Of six cases pending in United States district courts on June 30, 1941, three were terminated by successful prosecution, one was dismissed upon recommendation of the United States attorney, and two were pending June 30, 1942.

Of two cases pending with the Department of Justice on June 30, 1941, one was closed by the United States attorney and one remains unchanged.

Of eight cases under investigation on June 30, 1941, three were closed by the Board for lack of sufficient evidence, five were completed and submitted to the Department of Justice, of which one was

successfully prosecuted and four were pending further action on June 30, 1942.

Of 19 investigations begun during the year, 6 were incomplete on June 30, 1942, 5 were closed by the Board for lack of sufficient evidence and 8 were submitted to the Department of Justice for prosecution. Of the latter 8 cases, 1 was successfully prosecuted, 2 were presented to grand juries and indictments returned, and 5 were pending action of the Department of Justice on June 30, 1942.

The five cases successfully prosecuted during the year resulted in assessment of fines totaling \$121,800, and imposition of several suspended sentences ranging from 6 months to 2 years.

General Land Office

FRED W. JOHNSON, Commissioner

THE need for new supplies of strategic minerals, power, and grazing facilities, and the military and naval requirements for large areas of public lands placed increased responsibilities upon the General Land Office during the fiscal year ended June 30, 1942. The regular activities of the General Land Office are now geared to meet war needs, and they are effectively coordinated with the activities of other agencies for the purpose of facilitating the prosecution of the war program.

The withdrawal of public lands has been expedited by Executive Order No. 9146, authorizing the Secretary of the Interior to sign public land orders effecting the withdrawals. These withdrawals include lands for aerial bombing ranges, antiaircraft fields, combat training areas, artillery practice grounds, air navigation sites, flying schools, ammunition storage, and ordnance depots. Designated employees are devoting themselves exclusively to this work and a priority of routing has been established on all matters relating to the war. More than 7,000,000 acres were withdrawn during the year, making an aggregate of more than 13,000,000 acres withdrawn for military purposes.

In addition to the millions of acres of public lands made available by the General Land Office, the Government is acquiring for military and allied purposes extensive acreages of other land, which raises a serious post-war land use question. The General Land Office is studying this problem along with the other studies being made relative to uses of public lands which are to be returned to its administration at the close of the war under the reversion clauses in the withdrawal orders.

The war has prevented the importation of many minerals from their usual sources and these products must now be obtained as far as possible from domestic deposits. The General Land Office has cooperated with the Defense Plant Corporation, the Metals Reserve Co., the Reconstruction Finance Corporation, and other agencies in developing strategic and critical minerals.

In order to help make our Nation more self-sufficient, the General Land Office is conducting studies to determine new uses that may be made of resources on the public domain. New values are being found in the minerals, natural vegetation, sites for health and recreation, and other resources which heretofore were considered of little importance or not known to exist. Commercial quantities of strategic minerals may be developed from hitherto unused deposits, and such materials as fiber, rubber, turpentine, and resin may be produced from desert shrubs. A number of health and recreational sites have already been developed in desert areas. Barren desert areas so sparsely vegetated as to have little or no value for grazing or agriculture have been found to have terrain and climate especially adapted to the training of our armed forces. Other areas heretofore remote, inaccessible, and thinly populated have, because of these limitations, become very valuable for such purposes as heavy artillery or bombing practice areas.

Recent legislation has authorized the Secretary of the Interior to lease or sell lands in the public domain "for use in connection with the manufacture of arms, ammunition, and implements of war, or the production of equipment, supplies, and materials, or machinery usable in such manufacture." Under the Secretary's regulations, the Commissioner of the General Land Office will negotiate transactions providing land to be used for its yield of timber, sand, gravel, and stone; and as factory sites, housing development sites for war workers, and as expansion area for plants bordering the public domain.

Notwithstanding the increased burdens incident to the war which were handled without increased appropriation, the General Land Office maintained its position as one of the few agencies of the Federal Government whose operations resulted in revenues exceeding expenditures. Total cash receipts from all sources during the year amounted to \$9,014,172.87, which represents an increase of \$1,281,830.94 over the preceding year. The receipts were almost four and one-half times the amount of the expenditures (\$2,047,504.64), and this was the sixth consecutive year in which the receipts were in excess of \$7,000,000.

With the development of war plans, the Oregon and California Revested Lands Administration of the General Land Office immediately gave particular attention to special war needs, in addition to providing for the needs of the industry in manufacturing the usual types of lumber.

The volume of timber cut during the year was 456,131,000 board feet which represents an increase of 19 percent over the cutting of the preceding year.

During the fiscal year, the General Land Office increased its efforts to provide grazing land in areas in the Western States outside of

ing districts, and it now has outstanding 8,821 leases, covering 1,843.19 acres.

Because of the special hazards due to the war, the General Land Office greatly increased its fire prevention and suppression activities in the "O and C" forests in Oregon, the forest area in Alaska, and on public domain generally.

During the past fiscal year, many township plats and State maps were furnished to the War Department. For many parts of the United States, the best map data available for military purposes are the General Land Office township plats showing the boundaries of sections and the general topographic descriptions compiled in connection with the public land surveys.

The efficiency of the General Land Office was enhanced through the creation of a Branch of Field Examination by Secretary's order of January 17, 1942. It is the function of this branch to make such sections, surveys, or other field examinations as are essential to the operation of the General Land Office and of such other agencies of the Department as may best be served by it. The staffs for this branch, including regional field staffs at San Francisco, Calif.; Billings, Mont.; Salt Lake City, Utah; and Albuquerque, N. Mex., were supplied by the Division of Investigations of the Department which heretofore had handled such field examination work.

The total number of permanent employees of the General Land Office as of June 30, 1942, was 776. Of this number, 447 employees were stationed at headquarters in 36 cities in 13 Western States and Alaska.

Recommendations

As a result of the experiences and problems of the General Land Office, the following recommendations are made:

1. A leasing system applying, under certain conditions, to all minerals not now subject to leasing is urged. With respect to metallic minerals, there are no leasing or similar laws under which the Federal Government can share in any gains that might result from exploration or development work. As a result of the operation of the present mineral laws, metallic mineral deposits, upon discovery, may pass immediately into private ownership, and therefore, there are no known reserves of the metallic minerals on the unappropriated, unreserved public lands of the United States. New interest in the possibilities of producing strategic and other minerals on public domain lands has arisen because of the requirements of the war. Some procedure should be made possible, therefore, under which the Government could carry on additional exploratory work for metallic minerals on public domain lands and retrieve any minerals from discovery for the benefit of the Government and the

public. Such a procedure would make it economically feasible to carry on much exploratory work not otherwise possible. An important part of such a procedure would be the requirement that the lands be segregated so that they would not be subject to mineral claims but rather to mineral leasing laws.

2. In order that the Government may have a better knowledge and insight into the situation with regard to minerals, especially strategic and critical minerals, placer claim holders should be required to record their claims in the district land offices.

3. Provision should be made to prepare a comprehensive report upon a plan for the post-war development of the Territory of Alaska. The report should include not only the necessary basic information upon resources, conditions, and markets, but also recommendations for legislation, financing, and procedure. Such a report is necessary as a basis for planning an integrated economic development, increasing the permanent welfare of the present and future population of the Territory.

4. In administering the 5-Acre Tract Act, a number of difficulties have arisen because of the short-term lease system. It is recommended that the tracts could be made much more satisfactory to the owner if he wished to place substantial improvements on them, and that at the same time the public interest would be better protected, if, for unclassified lands, long-term leases could be granted. Study should be made as to the desirability of permitting sales in special areas.

5. In the interest of conserving our natural resources, additional attention should be given to war and post-war fire protection and control on public domain lands. In Alaska, particularly, additional effort should be given to protecting public domain forested grass lands, tundra, and coal deposits from destruction by fire. Not only are there millions of dollars worth of direct damage done annually to these resources, but inestimable damage is done in land erosion and destruction of all forms of wildlife.

6. Federal public lands are now administered under some antiquated public land laws. It is recommended that at the first opportunity provision be made for the careful study and restatement of the public land laws.

Military Reservations and Withdrawals

From July 1, 1941, to June 30, 1942, withdrawals from the public domain in the United States and Alaska aggregating more than 7,000,000 acres were made to permit construction and operation of facilities required by the Army, the Navy, and the Civil Aeronautics Administration.

The registers of the district land offices determined the status of thousands of acres and contributed their special knowledge of the districts in assisting in the selection of lands suitable for war purposes. Upon request of the Navy Department, the field examiners of the General Land Office assisted in the appraisal of privately owned lands. The General Land Office investigated thousands of patented mining claims in withdrawals for War Department use.

Strategic, Critical, and Other Minerals

The leasing and other activities of the General Land Office were greatly increased insofar as they may help to accelerate the production of minerals essential to the prosecution of the war. Every effort has been made to provide mineral lands and to facilitate their production to the fullest extent.

In opening reserved mineral deposits to exploitation, the General Land Office has made available large quantities of such minerals as copper, iron, lead, zinc, silver, and other minerals equally essential to the war effort. The production of oil and gas from 690,919 acres of leased public land is of vital importance. The potash reserves in New Mexico and California, operating under leases, now provide large supplies of potassium at less than one-sixth of the price paid for potassium during the First World War. Rents and royalties paid to the Government on mineral leases and permits amounted to \$393,046.37 for the fiscal year 1942, as compared with slightly over \$300,000 for the preceding year.

Food, Fiber, Leather, and Rubber

The production of beef, mutton, lamb, wool, mohair, and leather on the western ranges constitutes a very important contribution toward winning the war. During the period covered by this report, the General Land Office intensified its efforts to provide necessary grazing land and it now has outstanding 8,821 leases, covering 9,871,843.19 acres. Work is now under way on converting these leases from a short-term to a 10-year basis.

From July 1, 1941, to June 30, 1942, the General Land Office expended \$255,417.70 of Range Development Service and Soil and Water Conservation funds in the rehabilitation of public domain lands situated in the 10 Western States. The primary purpose of the range development work is to increase the carrying capacity of these lands from 500,000 animal units per year to 750,000 animal units. This objective can be accomplished by the exercise of proper range improvement and by an extended program of water development, reseeding, destruction of noxious weeds, rodent control, and

similar measures. Although it will take a considerable period of time in which to bring about the desired result, effective headway was made in this direction during the period under consideration.

In the interest of the livestock industry, stock driveway withdrawals in Arizona, Colorado, Nevada, Idaho, Montana, Washington, and Wyoming, covering 10,928 acres, were made during the year. Other adjustments were made for the purpose of improving the location and increasing the usefulness of the driveways. These withdrawals and adjustments are of particular significance to the prosecution of the war as they have facilitated the movement of stock made difficult by the curtailment of other means of transportation. Stock driveway revocations, releasing for grazing purposes lands no longer needed for driveways also have been prepared.

Investigations have been made of the possibility of using yucca growing on the public domain as a substitute for fibers that can no longer be obtained from the usual sources. Information has also been gathered on the possibilities of helping to relieve the rubber shortage, particularly through furnishing land for raising guayule, and making rabbit brush available from the public domain.

Lumber and Timber

The volume of timber cut during the year from lands under the jurisdiction of the Oregon and California Revested Lands Administration of the General Land Office was 456,131,000 board feet, which represents an increase of 19 percent over the cutting of the preceding year. Sales of timber on these lands amounted to 482,271,000 board feet. The quantity sold showed a decrease of 2 percent, as compared with the preceding year, but on a value basis sales showed an increase of 24 percent. The chief factor affecting the rate of timber cutting at the present time is the limited ability of the industry to produce. Owing to the great need for lumber for war construction and as substitutes for steel, demand is far greater than present ability to produce.

The "O and C" Administration has employed additional personnel, partly for the purpose of making and supervising timber sales which call for the cutting of special grades of timber required in the war program. The cutting of these special grades causes much unnecessary waste, unless carried out on a selective basis and properly supervised.

The "O and C" Administration participated in special surveys to determine how much Sitka spruce, suitable for aircraft manufacture, is available, and to determine the volume and location of the remaining supply of Port Orford cedar on "O and C" and other lands.

As a contribution to the defense of the Northwest, the Civilian Conservation Corps, under the supervision of the "O and C" Administra-

tion, built various war structures including revetment structures needed by the armed forces for the protection of aircraft. In other ways, the three Civilian Conservation Corps camps assigned to the General Land Office for work in the "O and C" area were utilized more than ever because of the importance of forest and forest products in time of war. In this connection, 10.8 miles of new high standard truck trails were constructed and 60 additional miles were maintained and improved. The importance of this work was recently highlighted by the designation by military authorities of one of the CCC constructed trails as an important link in the military transportation system of the coastal area. Other activities included the construction of telephone lines and horse trails, fire hazard reduction, forest nursery development, reforestation, white pine blister rust control, preparation and transportation of materials, and forest fire suppression, all of which contribute to the conservation of a nation's forest resources and to the security of a country at war. The closing of these camps on June 30, 1942, brought to an end the fine work they were doing in the protection and development of the "O and C" forests.

Fire Protection

The General Land Office increased its fire prevention and suppression activities, especially in the "O and C" forests in Oregon and the forest areas in Alaska, because of the additional hazards incident to the war.

In order to coordinate the forest fire-control activities of all agencies within the State of Oregon, the Oregon Forest Defense Council was created. Through the work of this Council, plans and policies were adopted which will greatly increase the effectiveness of fire-suppression agencies not only in meeting and handling the normal but also the abnormal forest-fire condition. Pursuing the cooperative policy which is guiding the forest-fire activities within Oregon, the "O and C" Administration has established several emergency fire-control camps to augment regular forces in such a way as to deal effectively with any emergency which may arise as a result of the war. Arrangements have been made with other protection agencies whereby the fullest cooperation will be maintained at all times in order that all forest, brush, or grass fires will be controlled as quickly and efficiently as possible with a minimum disturbance of war work.

The Alaskan Fire Control Service, under the jurisdiction of the General Land Office, is charged with the prevention and suppression of fires on the public domain lands of Alaska. Of the approximately 323,000,000 acres of vacant and unreserved public domain, an estimated 250,000,000 acres of timber and grazing lands need fire protection to assure continuance of Alaska's rich natural resources of timber,

furs, and wildlife. An additional amount of \$115,000 has been made available for prevention and suppression of forest fire to supplement the regular appropriation of \$27,000. A vigorous educational program in fire prevention has been continued during the past year. Because of war limitations on paper and radio releases, greater emphasis has been placed on personal contact in group gatherings, such as 4-H Clubs, Boy Scouts, Girl Scouts, Chambers of Commerce, and Service Clubs. The objective has been to bring fire consciousness to every class of people.

A Civilian Conservation Corps camp, under the supervision of the General Land Office, continued its work of suppressing the outcrop coal fires which were threatening with destruction an inestimable amount of the Nation's coal resources lying in the vicinity of Little Thunder Basin, Wyo. These coal deposits represent a fuel reserve of untold value. Despite the closing of this camp in May, all of the fire-suppression projects except one are in good enough condition to withstand further combustion for some time. However, several of the projects have not been completed and work should be resumed as soon as possible.

Surveys and Maps

Surveys have been undertaken at the request of agencies engaged in war work. The following surveys and resurveys, important to our war activities, were authorized, in progress, or accepted between July 1, 1941, and June 30, 1942: a resurvey in Colorado, requested by the Bureau of Mines in connection with helium production; a resurvey in Utah, requested by the Bureau of Mines in connection with exploratory drilling for magnesium; resurveys in Nevada, requested by the War Department; resurveys in California, requested by the War Department; survey in California of the Argus townsite needed to provide housing of workmen employed in potash and other war chemical plants; surveys in Alaska which were necessary in connection with War and Navy activities; and a resurvey of 65,500 acres of O and C land in western Oregon.

Land Classification

The purpose of land classification is to facilitate the best use of the land. Recent events have further emphasized that changing conditions and new demands affect what constitutes best land use. The impact of the war, for example, has created uses not existing or in demand in 1934 when the Taylor Grazing Act went into effect. Fortunately, large areas of the public domain have been found to be eminently suited for necessary war purposes.

Changing economic conditions have likewise resulted in a great variety of demands for use of the public lands. The construction of new roads into previously isolated areas, the erection of war plants, the

development of air fields, the extraction of minerals and the increased demand for recreational facilities are but a few of the causes which make it impossible to classify permanently lands for one use or another.

A number of area examinations and classifications, as distinct from classifications of tracts embraced in specific applications, have been undertaken during the past year. These areas, among others, are the Fence Lake-Quemado area of western New Mexico and the Dove Creek region of southwestern Colorado and southeastern Utah. Classification in these areas entails consideration of the social, economic, and agricultural problems incidental to dry farming, further complicated by relative isolation and a short growing season. The Casa Grande area of the Santa Cruz valley in Arizona presented a ground-water problem, which involved a determination of the relation of the ground-water supply to permanence of agriculture in the region, to find out where and to what extent additional public land could be reclaimed for agricultural purposes.

The Public Lands

The original public domain, exclusive of Alaska, aggregated 1,442,267,520 acres. As of June 30, 1942, 1,322,241,257 acres had been surveyed, leaving 120,026,263 acres unsurveyed. In Alaska, embracing about 365,481,600 acres, the area surveyed as of June 30, 1942, was 2,277,469 acres, leaving 363,204,131 acres unsurveyed.

On June 30, 1942, the area of the vacant and unreserved public lands, exclusive of Alaska (unreserved except for the general orders of withdrawal issued in 1934 and 1935) aggregated 38,504,043 acres outside of grazing districts. The area of vacant public lands within grazing districts and subject to grazing use was 135,504,043 acres. The area which was vacant and unreserved, in Alaska, is estimated at 323,000,000 acres.

Leases and Permits

The extent of the leasing activities of the General Land Office is shown by the following tables:

Mineral leases, permits, and licenses outstanding,¹ as of June 30, 1942

Mineral	Leases		Permits		Licenses		Total	
	Number	Acres	Number	Acres	Number	Acres	Number	Acres
Coal	372	71,284	124	89,607	99	3,193	595	164,084

¹ An original entry or selection is one made in pursuance of an act of the Congress which prescribes the terms and conditions under which patent may be issued or other evidence of title granted. An original entry becomes a final entry upon compliance by the entryman with further requirements of the law, such as residence or additional payment, and upon the issuance of a final certificate. A State selection becomes final upon certification by the Commissioner of the General Land Office.

² One entry amended.

³ Townlots upon which only part payment was made.

⁴ Area not tabulated.

Final entries ¹ fiscal year 1942

¹ Where upon final examination it is found that an entry or selection is in proper form and that the law has been complied with, a patent conveying the legal title to the claimant is issued. In the case of indemnity state selections, the legal title is conveyed upon approval thereof by the Secretary of the Interior and certification by the Commissioner of the General Land Office.

² Isolated Tracts.

³ Indian tribal lands.

⁴ Acreage not counted because previously reported.

⁵ Includes a small number of patents on Indian lands.

Land Grants

Despite the concentration of its efforts on war activities, the General Land Office has maintained its peacetime functions of assisting the States in providing for schools and internal improvement. Indemnity school land selections, amounting to 6,777.75 acres, were approved and certified to the States, with minerals reserved to the United States upon 1,760 acres. Selections under quantity grants to States for specific purposes, embracing 1,455.02 acres, were approved and patented with all minerals reserved to the United States, and 1,142.24 acres of swamp lands were patented. Patents for granted school sections were issued for 600,311.26 acres.

The rights of the land-grant railroads to institute higher rates for certain Government transportation services in return for releasing claims to additional lands expired on September 18, 1941, under the provisions of the Transportation Act of 1940. Before the expiration date, 65 of the 72 unforfeited railroad grants had been formally closed and the remaining 7 had been filed for closing. This brought to an end a phase of land activity which in pioneer years was of outstanding interest to the developers of the West.

Applications for 381 rights-of-way for railroads, highways, reservoirs, irrigation, and telephone, telegraph and pipe lines were approved.

Of the number approved, 155 were for permits or easements, with an annual rental of \$4,250.

Land Exchanges

Exchanges with private owners of land resulted in the addition to grazing districts of 19,830.42 acres, in exchange for 30,394.38 acres of Government lands; to a bird refuge 4,491.83 acres in exchange for 1,960.25 acres of Government land; to Indian reservations 17,889.70 acres in exchange for 167,135.18 acres of Government land; and to the national forests 484,804.17 acres in exchange for 10,524.7 acres, and in addition sufficient timber to equalize the values as is permitted in exchanges of this character.

Exchanges of lands with the States under the Taylor Grazing Act amounted to 492,269.02 acres, with all minerals reserved to the United States. These exchanges were made upon an equal area basis. Other exchanges of lands with the States amounted to 5,388.74 acres, patented or certified.

Receipts and Expenditures

The total cash receipts from all sources were \$9,014,172.87. The total expenditures from appropriations made for the conduct of the bureau were \$2,047,504.64.

The following table shows the distribution of the receipts:

Disposition of receipts of the General Land Office,¹ fiscal year 1942

Source of receipts	Covered in the Treasury earmarked for—				
	General fund	Reclamation fund	States and counties	Indian trust funds	Total
Sales of public lands	\$38,700.12	\$90,018.26	\$4,688.44		\$133,406.82

¹ Before final settlement of all accounts by the General Accounting Office.

² Includes \$381.25 collected in Alaska.

³ Includes \$46,412.27 collected in California under act of Oct. 2, 1917 (40 Stat. 297).

⁴ Includes \$16,344.35 collected in Wyoming under act of June 26, 1926 (44 Stat. 1621) and \$10,883.20 collected in Alaska.

⁵ Estimate.

⁶ Includes \$58.74 collected from sales of Reclamation lands under act of May 20, 1920 (41 Stat. 605).

Grazing Service

R. H. RUTLEDGE, Director

EVENTS of the 1942 fiscal year broadened the scope of Grazing Service activities and tested its ability to meet new situations caused by the stress of sudden and total war.

Immediately after Pearl Harbor the Secretary of the Interior placed the Department on a wartime footing, declaring that: "Actions upon matters resulting from declarations of war will have precedence over all other duties." Spurred by that declaration, the Grazing Service reexamined its problems and stepped up its operations to a war tempo, gaining momentum as the year progressed. Advisory boards, other ranchers, and citizens cooperated to protect forage and timber resources, produce more meat and fiber, and to promote full partnership in the fight for survival.

New uses of public lands.—To meet the increased demands made upon the range by war, the public domain took on new and added importance. Furnishing proving grounds for the thousands of American planes, bombers, and tanks, nearly 3,500,000 acres in Federal grazing districts were converted during the year into training areas, bringing the area withdrawn for military purposes in 2 years to 8,500,000 acres. Although requiring sudden adjustment in some cases, stockmen gave whole-hearted support to the program. At the same time livestock production was kept on a high level. Certain hardships were experienced by growers in some areas but to them the training program was of paramount importance.

Decentralization.—During the first week of August 1941, the transfer of the headquarters of the Grazing Service from Washington to Salt Lake City was completed.

Salt Lake City is at the hub of the Federal range territory. Spokes radiate from this hub to the 10 regional offices, none of which is more than 500 miles from the Director's desk in the Walker Bank Building.

In bringing the Grazing Service to the center of its job, the transfer helped to advance cooperation among all agencies engaged on western resource problems. Technicians of the Department were brought to-

gether to discuss how the several agencies could contribute, promptly and effectively, to the solution of the war problems.

Western War Resources Council.—At the suggestion of the Director of Grazing, 20 men from the several Interior Department bureaus operating in Western States met in March 1942 and organized a Western War Resources Council to coordinate ideas and to integrate facilities for war purposes. The Director was made chairman and his office was designated as a clearing house for information and prompt contact with war agencies, producers, and the Secretary's War Resources Council. In this way technical and skilled assistance was rendered promptly to individuals, corporations, agencies, and groups working on discovery, development, merchandising, transporting, stockpiling, and processing of materials for war.

National Advisory Board Council.—Livestock people cooperated in every way possible to protect resources and to help win the war. Reflecting full accord of the industry, the National Advisory Board Council recommended a program to maintain the ranges in full productive capacity, organize range users to protect ranges and forests against fire and other destructive elements, combat subversive activities and sabotage, and produce more pounds of wool, meat, and hides by better husbandry of range and stock.

This council, composed of 20 leading stockmen in the 10 range States, continues to cooperate on all matters of vital interest to the industry itself and the 21,000 licensees and permittees in grazing districts.

The Federal Range Code.—A revised draft of the Federal Range Code, which had been considered jointly by the advisory boards and the Grazing Service during the previous year, was studied by the National Advisory Board Council in Salt Lake City in January 1942. Upon conclusion of its 2-day session, and agreement on certain further changes, this council voted that the revised code be submitted to the Secretary for approval.

Protection of nonuse.—Under the full impact of war, policies of conservation with use undergo the supreme test, and the experiences of the past year have broadened public support for these fundamental principles.

An important part of the Nation's Food-for-Victory program is to produce more tonnage of meat and yet maintain the range in good vigor. In recent years stockmen themselves have proven that this can be done with greater net returns realized. In many areas it has been achieved by voluntary reduction of numbers, improved breeding, culling of herds, and better range management coupled with water development and other improvements. The livestock operator and the Grazing Service have never before been so closely in agreement on the dual objectives of conservation with economic use, and the

percentages of operators who are applying these principles are increasing steadily.

The Secretary, recognizing the need for the protection of operators brought about by the unusual conditions existing because of the war, established a departmental policy of granting nonuse permits for an indefinite period when:

1. The range is overstocked and the operator voluntarily states that he is willing to run the reduced numbers until such a time as the range shows improvement.
2. The range is not overstocked but the operator is unable to obtain replacement numbers after selling or culling for the purpose of meeting increased marketing goals that are established as a part of the Food-for-Victory program.

Going one step further, he extended the same privilege under other conditions which may arise, but which are entirely beyond the control of the individual operator.

Licenses and Permits.—Stockmen took advantage of good prices to reduce numbers and shape herds, resulting in a decrease of 111,101 head on the range as compared with the previous year. A total of 6,110, or about 29 percent of the users, were on a term permit basis at the end of the fiscal year. Matters that deterred the desired progress on permits have been cleared up in most regions, and a high percentage of all users will be on a permit basis at an early date. Wilful trespass was kept to a minimum due to the cooperation of range users and to further subdivision of the range into individual and group allotments. A summary of range use in 1942 is shown in Table 1.

TABLE 1.—Livestock use of grazing districts, fiscal year 1942

Region	Number of licensees and per- mittees	Number of cattle	Number of horses	Number of sheep	Number of goats	Total live- stock
Arizona	648	100,364	3,391	118,155	29,981	251,891
Colorado	2,111	179,640	5,351	798,438	98	983,527
Idaho	3,280	200,679	20,366	1,613,324	118	1,834,487
Montana	2,955	151,840	24,425	974,281	46	1,150,592
Nevada-California	1,832	347,818	19,721	944,621	4,837	1,316,997
New Mexico	2,136	282,863	14,443	619,702	81,687	998,695
New Mexico No. 7	1,378	4,755	8,525	150,696	19,056	183,022
Oregon	1,417	186,869	14,352	470,028	-----	671,249
Utah	3,946	195,572	10,129	1,705,652	13,840	1,925,198
Wyoming	1,446	159,846	13,154	1,479,123	360	1,652,453
Total	21,249	1,810,246	133,857	8,874,010	150,023	10,968,138

Reseeding.—Range reseeding experience furnished a valuable guide to better future methods and to the selection of species which are most likely to succeed on the arid and semiarid ranges. A total of 199,670 acres was reseeded in 1942 compared with 66,000 acres the previous year. It has been definitely shown that for successful reseeding there

must be a coordinated program of rodent control and other control features.

Range Surveys.—Nineteen million acres of range lands were surveyed and a recheck survey accomplished on 10 million acres during the year. Most of this field work was compiled and kept current for administrative use.

Advisory boards continued to give their support financially and otherwise to the range survey program, and this technical work reached a new high in its contributions to the objectives of the Service.

Soil and Moisture Conservation.—The second year of activities under the President's Fourth Reorganization Plan dealing with soil- and moisture-conservation work in grazing districts advanced the over-all range development program. Original range project areas were reduced in size, conforming to grazing administrative units, and the soil and moisture work became an integral part of the entire job, being coordinated into a closely knit Departmental program.

Range Studies.—Work at the Squaw Butte Range and Livestock Station was correlated with the Harney Branch Agricultural Station at Burns, Oreg., under a superintendent employed by the Grazing Service. Conducted as before in cooperation with the Oregon State Agricultural College, the new arrangement afforded a year-long livestock study applicable to a ranch and range empire aggregating about 30 million acres in four States.

The collection of actual range use records through utilization checks continued to furnish guides for helping the stockmen and the Grazing Service determine rate of stocking, seasons of use, and other information where range surveys are as yet incomplete. The range appraisal study was continued by collecting additional range-operation data. No recommendation has been made as to the establishment of grazing fees varying from those now in force, such being held in abeyance until after the war. Cooperative range studies were expanded to many areas in several States. Field work on the Elko County, Nev., project was completed and the results analyzed, compiled, and shaped for joint publication.

Wildlife.—Wildlife conservation, predatory animal control, rodent control, and State Pittman-Robertson Act projects advanced under continued cooperation with the Fish and Wildlife Service, with other Federal agencies, and with States and groups interested in such problems in grazing districts. In certain congested areas plans were developed to increase the big-game kill under systematic hunting supervised by appropriate authorities. Surveys indicate a big-game population of about 419,000 such animals in Federal grazing districts, with some only seasonally.

Range Improvements and Maintenance.—Range improvement work was confined largely to water development, construction of trails and

feeder roads, revegetation, maintenance, and other activities requiring little or no critical material. With dwindling enrollee strength and shortage of materials, the accomplishments fell below those of the previous year when 89 camps were maintained in full operation. A summary of major accomplishments for the fiscal year and for the period April 1935 to June 1942, is shown on Table 2.

TABLE 2.—Major range improvements, end fiscal year 1942

Fire fighting.....	Man days.....	9, 538	121, 970

Range Fires.—Due to increased forage growth, curtailment of CCC, and possible increase in subversive activities on the range territory, the fire hazard is of growing concern. CCC enrollee contributions cannot be measured in dollars and cents. In 6 years prior to January 1, 1942, these boys devoted 180,000 man days (500 man years) to range fire control. During the 1941 calendar year alone there were 433 fires in the grazing districts and a total burn of 1,614,000 acres. This destroyed forage that would feed 16,000 cattle or 80,000 sheep one year, representing a loss of 4,000 tons of meat. Grass fires move fast and, without manpower and tools ready for quick counterattack, the results are devastating.

To help meet this situation in the face of reduced manpower, the Service reorganized its fire fighting setup. A fire supervisor, with a small contingent of trained men and with authority to recruit per diem guards and fire fighters subject to call when needed, was appointed in each of the 10 grazing regions and coordinated with the Office of Civilian Defense in accordance with Executive Order No. 9165 of May 15. Cooperation with ranchers, highway patrols, CAA training posts, and other groups for prompt reporting of fires, provided an effi-

cient, widely spread fire detection plan. The sum of \$25,000 appropriated by Congress to control range fire was thinly spread in the regions of highest fire hazard. For the present season the Office of Land Utilization has allotted \$100,000 to the Grazing Service for emergency fire protection.

Civilian Conservation Corps.—Wherever possible CCC work in grazing districts was devoted to war-aid projects. As the number of camps and the size of enrollee strength tapered downward, facilities and equipment were put in shape for military requests. Eight camps finished the year on a full-time war basis, constructing roads to mineral deposits, posting bombing ranges, guarding water supplies, and developing airfields in four States. One side camp, connected with 10 camps in the intermountain area by short wave radio, operated as a central detection service in cooperation with the Office of Civilian Defense. At these stations enrollees kept a 24-hour alert, and some instances of private unauthorized night flying were detected and reported.

Hearings and Appeals.—Of the 326 appeals involving grazing privileges filed during the year, more than half were disposed of by local agreements or by examiners' decisions. Twenty-three grazing cases involving 48 persons were appealed to the Secretary of the Interior during the year. The Secretary rendered 30 decisions on grazing cases during the year.

Consolidation.—During the year a chief counsel was attached to the Office of the Director to coordinate and to integrate legal matters with the Office of the Solicitor. Full cooperation was had with other agencies of the Department on a multitude of interlocking problems which required legal interpretation. The work of the Engineering, Inspection, and Safety units and the Range Surveys unit, formerly operating as field units at Salt Lake City, also was consolidated in the Office of the Director.

Funds and Personnel.—Administrative funds provided by Congress, including per diem and travel for district advisers, totaled \$800,000 for the fiscal year. Other funds allotted and contributed for soil and moisture conservation work; for construction and maintenance of range improvements; for protection against range and forest fires; for leasing of Pierce Act grazing lands, and for CCC camp operation, totaled \$2,778,329.94.

Salaried employees totaled 658 on June 30, a net decrease of 482 during the year, due primarily to abolishment of CCC camps, military furloughs, and transfers. Ninety-six employees entered military service, 46 transferred to war agencies, and others resigned to work in war production plants.

Grazing Fees.—Earned grazing fees in the 10 States totaled \$899,962.12 during the year, bringing the total so earned since 1936 to

\$4,567,456.71. Except an item of \$1,382.21 deposited to the credit of Indians in certain grazing districts, one-half of the 1942 earned fees (\$449,289.94) is shared by the 10 States in proportion to the amount users paid in those States as follows: Arizona \$25,909.48, California \$9,818.38, Colorado \$29,636.80, Idaho \$55,291.21, Montana \$33,494.08, Nevada \$80,307.22, New Mexico \$52,646.44, Oregon \$26,392.00, Utah \$69,908.40, and Wyoming \$65,885.93. To date, the States mentioned have shared in earned grazing fees to the extent of \$2,262,711.69. In turn they have contributed \$421,191.04, to be used under State laws for range development work specified by the stockmen's advisory boards. In the 1942 fiscal year \$68,621.22 was contributed for such purposes. This is commonly referred to as the 50 percent fund.

Equipment.—Much heavy CCC equipment was transferred to the Army Quartermaster and some was delivered to central repair shops. Certain units were later loaned back to the Grazing Service for fire protection and access road construction, thus placing the Grazing Service in a fairly good position with equipment to conduct pressing emergency work.

Whenever possible, travel was made by common carrier. When absolutely necessary to travel by automobile, pool trips were arranged within the Service itself and a plan worked out with other Interior Department agencies in the West for interbureau pooling of automobile travel when feasible. Strict accountability was placed on drivers and mechanics to maintain rigid inspection and upkeep standards, to reduce accidents, conserve fuel, rubber, and rolling stock.

Job Load Analysis, Audit, Inspection, and Training.—Job load analyses, based on 31 primary grazing district activities, revealed a much greater work load than the present force can possibly accomplish.

A system of proprietary accounting was installed at the beginning of the year and all business transactions of the Grazing Service were reviewed, resulting in improved fiscal and property records in the districts. Reduction of the auditor force, leaving only one such employee in the Service, slowed down this important phase of the work.

Training at CCC camps consisting of on-the-job instruction involving machinery, tools, drafting, and specialized classroom work equipped thousands of enrollees for effective front line and supply line duty. A 3-week field conference of 37 key district men featured training-in-service.

Status of Grazing Districts.—One additional district was established during the year, bringing the total to 58, with an approximate gross area of 264,600,000 acres. Vacant public land in grazing districts totalled 133,419,100 acres. Sixty-two modification orders resulted in additions to grazing districts of 1,995,000 acres and the elimination of 2,252,000 acres from districts. About 93,000 acres were added to districts by orders revoking stockdriveway withdrawals created by

other public land laws. A breakdown of grazing district areas by States is shown on table 3.

TABLE 3.—Acreages in grazing districts, June 30, 1942

State	Number of districts	Gross area	Vacant unappropriated public land	Other public land	Total administered by Grazing Service	Other land
Arizona	4	18,171,400	10,067,100	719,900	10,787,000	7,384,400
California	2	8,050,300	2,869,700	812,400	3,682,100	4,368,200
Colorado	8	15,903,700	7,190,200	643,600	7,833,800	8,069,900
Idaho	5	21,867,600	11,000,000	762,200	11,762,200	10,105,400
Montana	6	31,968,700	4,555,100	923,800	5,478,900	26,489,800
Nevada	5	48,560,200	34,466,800	549,700	35,016,500	13,543,700
New Mexico	7	39,747,400	14,506,200	684,400	15,190,600	24,556,800
Oregon	7	20,346,500	12,245,100	148,300	12,393,400	7,953,100
Utah	9	37,487,800	23,582,700	2,142,900	25,725,600	11,762,200
Wyoming	5	22,506,100	12,936,200	1,092,900	14,029,100	8,477,000
Total	58	264,609,700	133,419,100	8,480,100	141,899,200	122,710,500

Office of Land Utilization

LEE MUCK, Assistant to the Secretary

THE Department of the Interior is charged with the administration of a vast national estate and although about 12,000,000 acres are withdrawn for military purposes during the fiscal years 1941 and 1942, there are still under the jurisdiction of the Department approximately 275,000,000 acres in the continental United States and 350,000,000 acres in the Territory of Alaska. The condition of these lands, including the resources thereon, is highly variable, ranging all the way from open grazing areas to primeval forest and from bare desert to scenic masterpieces.

The state of extreme diversification which exists has resulted in a correspondingly wide range of aims and purposes and has created a situation which requires a high degree of coordination if a unified conservation policy is to govern the administrative management of the estate. In recognition of the necessities in this connection the Office of Land Utilization was established as a unit of the Office of the Secretary under date of April 15, 1940.

The Office of Land Utilization is charged with the responsibility of securing the cooperation of the action agencies and the correlation of their functions, programs, and activities in the field of resource management. It supervises the expenditure of departmental conservation appropriations and exercises the fiscal control incident to such supervision, including the preparation of estimates, the presentation thereof to the Bureau of the Budget and to the Congress and the allotment of funds to the bureaus and agencies concerned with soil conservation and emergency protection programs.

Activities Reoriented

Before the fiscal year 1942 had reached its median point, the Nation was shocked by the attack upon Pearl Harbor by the Japanese Imperial Government and the consequent declaration of war by the American Congress. This necessitated a reorientation of the activities of

the agencies in the Department of the Interior having control or supervision over natural resources. Fortunately the steps toward reorganization, cooperation, and correlation that had already been taken were such as to facilitate a prompt and effective meeting of the new problems encountered. Without endangering gains already made, or in any way compromising the conservation aims of the Department, the Office of Land Utilization has, during the last half of the fiscal year 1942, given first attention to directing coordinated land-management programs so as to increase timber production and to augment the quantity and quality of products from the western range lands under the administration of the Department of the Interior. Increased amounts of timber, food, minerals, and other raw materials are now flowing directly into war channels from forest, range, and other types of land under the supervision of the Department of the Interior.

In recognition of the requirements of the war emergency, action has been taken toward the restriction of developmental activities to those that are urgently essential to a maintenance of existing values and to the highest possible contribution to the effective prosecution of the war. Emphasis is being placed upon projects that will contribute directly and substantially to the accomplishment of military objectives. The funds available for forest and range purposes are being devoted primarily to the protection of existing resources, and the development of those that will serve the imperative current needs of the Nation. Many improvements that are recognized as desirable on public lands, national parks, reserves for wildlife, and Indian reservations will be deferred until after the war has been won.

Soil and Moisture Conservation Operations

The President's Reorganization Plan No. 4 transferred the functions of the Soil Conservation Service of the Department of Agriculture with respect to operations conducted on lands under the jurisdiction of the Department of the Interior to the Department of the Interior effective July 1, 1940. The transfer imposed new and enlarged obligations upon the latter Department. However, it was a logical development in the plan of the President to establish definitive fields of responsibility in Federal administration. The coordination of the soil and moisture conservation activities of the Department was assigned to the Office of Land Utilization, and field operations were placed under the direct supervision of the action agencies.

The soil and moisture conservation program of the Department of the Interior had been fully organized and was well under way by the end of the fiscal year 1941. Governing policies and procedures had

fully laid down; practical project plans formulated and approved; and a competent technical staff placed in charge of field operations. An appropriation of \$2,178,700 was authorized for the fiscal year 1942 and since this was only slightly less than the amount made available for the preceding year, operations were continued for the first 6 months in accordance with the plans formulated during 1941. Promptly after Pearl Harbor, however, the soil and moisture conservation program was modified; the acreages included in project areas were reduced; and operations were restricted to those which would produce prompt results. The primary purpose of this streamlining process was to limit work to those projects which would give immediate results (1) by actually increasing livestock production, and (2) by reducing siltation, flood damage, or other adverse conditions affecting irrigation projects or strategic facilities which might adversely affect production.

Special emphasis was placed upon projects which would increase production. Range reseeding, small water developments, water recharging, vegetative gully control, and similar projects that are low cost, and require the use of local materials, were the principal types of work engaged in during the year. Soil and moisture conservation operations such as these helped to increase the forage resources of the range without taking from industrial projects the critical materials urgently needed in the production of equipment and facilities of primary importance in the war program.

Past conservation programs on range lands under the jurisdiction of the Department of the Interior, coupled with the simplified but highly productive program carried out in the fiscal year 1942, not only insured better and higher production of range products for war but guaranteed continued protection of the publicly owned range lands from overuse and misuse during the period of hostilities.

Close cooperation was maintained by field offices throughout the year 1942 with local soil conservation districts. A cooperative agreement for use by the land-management bureaus of the Department and local soil conservation districts was formulated. These cooperative agreements, when entered into between the bureaus of the Department and local soil conservation districts, provide for conducting correlated programs of soil and moisture conservation on public and private lands within such conservation districts. Cooperative relationships were greatly strengthened through the declaration of a joint policy by the Department of the Interior and the Department of Agriculture. This policy statement set forth the broad principles for initiating and carrying out simplified soil and moisture conservation operations on an integrated basis on both public and private lands.

Forest Conservation and Development

The forest resources under the jurisdiction of the Department of the Interior are so strategically situated and so well developed to make substantial contributions to the prosecution of the war. These resources are in a position to furnish large volumes of forest products during the existing emergency, and the administrative agencies in charge of development have been so organized to meet the substantial increase in demand which has developed. New forest management plans devised and put into practical application by the Oregon and California Revested Lands Administration, a division of the General Land Office, and the Forestry and Game Division of the Office of Indian Affairs, timber cuts have been substantially increased to help fill the Nation's war demands for forest products.

Immediately following the entrance of the United States into the present conflict, the Department of the Interior set up a production goal of over 1 billion feet b. m. of timber from the Oregon and California revested lands and from Indian forests for the year 1942. Timber cutting rates were increased immediately and the sale of additional timber was authorized from both Indian lands and O. and C. lands.

During the fiscal year 1942 a total volume of 456,131,000 feet b. m., having a value of \$1,079,000, was cut from the O. and C. forests. Thus, for the first time the sustained-yield capacity of 500,000,000 feet b. m. per annum prescribed by the act of August 28, 1937 (51 Stat. 874) was approached. The volume cut in 1941 was 383,000,000 feet b. m., thereby reflecting a production increase for the year 1942 of approximately 75,000,000 feet b. m.

One hundred ninety-five new timber sale contracts on the O. and C. lands were completed during the fiscal year 1942 involving a volume of 482,271,000 feet b. m. for which the purchasers agreed to pay a total of \$1,356,820. In the previous year 172 timber sale contracts were completed, involving 493,000,000 feet b. m. and a value of \$1,095,584, reflecting an increase of approximately 25 percent in the value of the timber sold. The cost of administration and production on the O. and C. lands for the year 1942 was \$228,000, which when considered with the cash receipts for that period of \$1,150,000 reflects a ratio of cost to income of about 19 percent.

The sale of timber from Indian forests was also increased substantially during the fiscal year 1942 and the income received therefrom also greatly increased. Stumpage prices were advanced on practically all timber contracts in effect and several new large contracts in the States of Oregon and Washington were executed and approved.

The total income from Indian forest and range lands during

fiscal year ending June 30, 1942 was \$3,378,000 and the cost of administration and protection \$610,000, reflecting an operating coefficient of approximately 18 percent.

Although the production of timber from both Indian forests and O. and C. forests was increased during the year 1942, the development of these resources was conducted in full accordance with the Department's conservation policies and the legal requirements with respect to the application of the principles of sustained-yield forest management. The conservation aspects of good forest management were in no way subordinated to the development program. Thus the forests under Department of the Interior administration are meeting the demands for increased production for war without jeopardizing the forest resources under management.

Programs Related to War

In addition to conducting its regular land-management functions and activities during the fiscal year 1942, the Office of Land Utilization, in cooperation with other bureaus and agencies of the Department of the Interior, was charged with additional authority and responsibility in connection with the supervision of programs related directly to the war.

Under date of August 17, 1941, the Director of the Office of Civilian Defense, acting under a directive from the President, initiated the organization of a Facility Security program in cooperation with the departments and agencies of the Federal Government. The Facility Security program has as its objective the mobilization of existing authorities and nonmilitary forces of the Nation into a well-organized front against subversive action. It also seeks a reduction of danger from fire and other hazards of accidental origin which may possibly disrupt the war program.

The execution of the protection program for strategic resources and facilities was delegated to appropriate agencies of the Federal Government operating in the various resource and facility fields. In this connection 10 facility protection subcommittees were organized, namely: communications, air commerce, highways, railroads, public buildings, timber and related facilities, minerals and related facilities, foodstuffs and storage, power and irrigation water, and domestic water.

The forestry agencies of the Department of the Interior, in cooperation with the Forest Service, Department of Agriculture, have been charged with the prosecution of the timber security program; responsibility for the protection of minerals, including petroleum, has been delegated to the Bureau of Mines and the Office of the Petroleum Coordinator for War; and the Bureau of Reclamation, in cooperation with the Federal Power Commission, has assumed the

responsibility of protecting the power resources and irrigation facilities of the Nation. The Assistant to the Secretary of the Interior in Charge of Land Utilization was designated as the chairman of the Timber and Related Facilities Subcommittee of the Office of Civilian Defense, and acting in that capacity, and under the coordinating authority vested in him by the Department, organized the fire protection program covering the lands under the jurisdiction of the Department of the Interior.

On May 19, 1942, the President issued Executive Order No. 9165 which directed the Office of Civilian Defense to assume responsibility for the development and execution of a program of protective measures against subversive enemies. This order gave authority and impetus to the plans and programs which had already been worked out by the various facility security subcommittees of the Office of Civilian Defense. In fact, surveys had been conducted in the various facility and resource fields and action programs formulated in detail. As a result of the state of completion of the plans covering the timber and mineral fields, protection programs were ready for immediate action upon the enactment of the Sixth Supplemental National Defense Appropriation bill for 1942-43. The bill, which was signed by the President on April 28, 1942, included \$812,000 for the protection of forest, brush, and grasslands under the jurisdiction of the Department of the Interior and \$800,000 for the protection of mineral resources and facilities of the Nation including petroleum. Subsequently an additional appropriation of \$95,900 for the protection of forests was authorized in the Appropriation Act of the Department of the Interior for the fiscal year 1943.

Within a comparatively short period of time after the appropriation had been made available for the protection of forest, brush, and grasslands under the jurisdiction of the Department of the Interior, funds were allotted to the action agencies by the Office of Land Utilization and detailed programs of protection formulated and approved. By the end of the fiscal year 1942 the emergency fire protection program had been fully organized, and for the first time in the history of the Department a comparatively adequate plan of protection for the resources under its jurisdiction was placed in effect.

The emergency protection funds authorized by the Congress made it possible for the Department of the Interior to greatly strengthen its protection organizations on Indian lands, the Oregon and California revested grant lands, the national parks, and the wildlife refuges. Protective measures were also provided for the unreserved and unappropriated public lands under the jurisdiction of the General Land Office. Operations in the continental United States were confined largely to lands situated within 300 miles of the eastern and western coasts and gulfs of California and Mexico by reason of the strategic

importance of these zones from the standpoint of possible attacks from the air. However, attention was also directed to areas of high hazard where accidental or incendiary fires might totally disrupt or temporarily obstruct the progress of the protection programs essential to the prosecution of the war.

Owing to the strategic importance of Alaska, special consideration was given to the large areas of forest and brush land in the interior of the Territory. Adequate funds have never been available for the protection of these vast resources. However, the Sixth Supplemental National Defense Appropriation made it possible to set aside \$200,000 for the protection of these lands and to initiate measures which would provide at least a fair degree of security.

As a part of the emergency fire protection program, plans were completed during the latter part of the fiscal year 1942 providing for the cooperation of the Civil Air Patrol in the protection from fire of forest, brush, and grasslands in the continental United States. The establishment of this service greatly strengthened the programs of the protection agencies and made the Civil Air Patrol available to these agencies for fire detection and the transportation of men and supplies to fires in inaccessible areas. The details of the plan were worked out by the Civil Air Patrol in cooperation with the United States Forest Service, Department of Agriculture, and the Office of Land Utilization and the protection agencies of the Department of the Interior.

The emergency fire protection program of the Nation was further strengthened by the establishment of the Forest Fire Fighters Service by the Office of Civilian Defense in cooperation with the forestry agencies of the Department of the Interior and the Department of Agriculture. The purpose of the organization is to safeguard forest lands and other related facilities and resources and to aid in the prevention and suppression of fires which might endanger such facilities or resources. The Forest Fire Fighters Service cooperates with the Department of the Interior, the Department of Agriculture, State forestry officials and private forest protection organizations in mobilizing the manpower necessary to safeguard forest resources. The organization is being trained by specialists of the various agencies under which they will operate wherever increased manpower is essential for adequate protection. It will assist materially in providing the protection agencies of the Nation with trained manpower.

Another program of outstanding importance to the prosecution of the war, with which the Office of Land Utilization was directly concerned during the fiscal year 1942, was the relocation of Japanese evacuees from the West Coast areas upon lands under the jurisdiction of the Department of the Interior. The Office of Indian Affairs, the Bureau of Reclamation and the Office of Land Utilization cooperated effectively with the War Relocation Authority from the inception of

this undertaking and large numbers of evacuees were relocated upon Department of the Interior lands in Arizona and Oregon. Several other projects for the relocation of evacuees were under consideration at the close of the year and the working out of cooperative agreements and land-use permits by the War Relocation Authority and the Department of the Interior were in process. It is expected that the responsibilities assumed by the Department of the Interior agencies in this connection will be continued for the duration of the war.

National Park Service

NEWTON B. DRURY, Director

THE fact that the Nation is at war and that all resources, material and spiritual, must be mobilized for victory has altered the immediate program of the National Park Service but has given added meaning to its ultimate objectives.

As the situation has declined, many activities have been curtailed or reduced, and the Service has faced the necessity of adapting itself to rapidly changing conditions. It has been possible to give direct aid to the war program through properties and personnel. Uses of park lands not contemplated in peacetime are being undertaken, even to the point of sacrifice of park values where clearly necessary and with no alternative, as part of the cost of victory.

At the same time the stress of war has compelled the Service to re-evaluate its stock of its primary functions and responsibilities. As trustee for some of the great things of America—areas of outstanding natural beauty, scientific interest, and historical significance—the National Park Service has realized its obligation to harmonize its activities with the war, relating to the war, aiding wherever possible, and striving to hold fast to those things entrusted to it—the properties themselves, the organization trained to perform its tasks, and, most important, the uniquely American concept under which the national parks are reserved inviolate for the present and future benefit of all of our people.

In time of war, no less than in peace, the national parks and allied areas have served as havens of refuge for those fortunate enough to be able to visit them. Providing an environment that tends to give relief from the tension of a warring world, the parks are being looked upon as a factor in a program of rehabilitation, physical and mental, that is increasingly necessary as the war progresses. In the past 12 months, July 1, 1941, to June 30, 1942, approximately 650,000 members of the armed forces have visited the parks. Even though the demands of war may sharply curtail use by the civilian population for recreation, Americans will still take pride and courage in the fact that this part of their cultural heritage is being preserved for future enjoyment.

The wisdom of the Nation in preserving these areas is clearly on the American continent today as increased demands upon natural resources are invading and forever changing the natural landscape. The national parks and monuments may soon be among the few places in the world where forests continue to evolve naturally where animal life remains in harmonious relationship to its environment, and where the ways of Nature and its works may still be seen in the original design.

War Activities of the National Park Service

On December 16, 1941, the Secretary of the Interior called upon the bureaus of the Department for "full mobilization of the Nation's natural resources for war . . . upon a basis best suited to serve the military and naval forces without waste, and with a view to seeing that we can of such resources for future generations."

The National Park Service has responded to that call, doing things that came within its functions, endeavoring meanwhile to perform its established tasks, and not looking upon the war period as an opportunity to expand.

In all, 125 permits have been issued by the Department of the Interior to the War and Navy Departments and war agencies to make use of National Park Service lands, buildings, and facilities. These permits have ranged from the installation of directional signs along the coastal areas to the complete assignment during the period of two national monuments—Fort Pulaski in Georgia and Cabrillo in California. The extent and nature of most of these permits of necessity is confidential.

The Paradise section of Mount Rainier National Park was used last winter for training troops in mountain warfare.

At Boulder Dam National Recreational Area, lands for an aerial rifle range, recreational development, and rights-of-way for pipelines to serve the Defense Plant Corporation with water from Lake Mead for the operation of a vital magnesium project were turned over to the Army, Navy, and war production agencies. Temporary emergency permission was given to the Defense Plant Corporation for the removal of salt, necessary in the production of magnesium from Death Valley National Monument.

The Chickamauga and Chattanooga National Military Park accommodates a large Army recreation camp; it also is a training center for the Provost Marshal of the United States Army.

To assist the War Production Board, approximately 40 Service employees were assigned to a pig-iron survey in about 900 foot locations located in New York, Pennsylvania, Ohio, Michigan, Illinois, and Wisconsin.

Immediate steps were taken after the declaration of war to establish lookout and air-raid-warning towers in forested areas and to provide trained crews to combat forest fires and man lookout and patrol parties. Arrangements have been made whereby the observers cooperate with the designated authorities in spotting and reporting fires. The Service has taken part in the formation of emergency organizations in the Pacific Coast States and Montana. Fire drills were conducted throughout the park system for training rangers in forest and building fire suppression, control of incendiary bombs, defense against sabotage and other war hazards, law enforcement, protection of visitors, and conduct of operations under emergency conditions. Emergency organization plans have been developed for each park area.

First-aid courses and ambulance service training have been given practically all areas of the National Park Service. Hospital supplies from Yosemite and Sequoia National Parks were made available to hospitals in the San Joaquin Valley to accommodate patients that were moved from the San Francisco hospitals required for the sick and wounded from Pearl Harbor.

There have been numerous instances throughout the National Park System where the Service personnel were the only sources of scientific information and Government-owned lands, buildings, and equipment were the only readily available facilities. In many small towns and isolated areas Service buildings were used as headquarters for the Selective Service System, Office of Civilian Defense, Aircraft Warning Service, rationing boards, and other public organizations. Direct assistance has been given and is being given to the Army, Navy, Marine Corps, and Coast Guard personnel in providing quarters, packing for troops on maneuvers, and furnishing equipment and supplies that are often required. The knowledge that Service personnel have of the areas under their administration is constantly sought by military authorities. The Army has requested Service landscape architects, engineers, and field men to assist in locating gun emplacements and effectively camouflaging them, and in reporting weather, condition of roads and trails, and accessibility of mountain and densely forested areas.

Army Rest Camps

Early in the spring of 1941 the Army recognized the desirability of providing inexpensive facilities in areas which would be available for use by soldiers on leave or which could be used for a week or two at a time to give men relief from the training grind. Field technicians of the National Park Service were called upon to assist in planning and directing our CCC forces in the construction of Army rest camps.

As the first six camps approached completion, a steadily increasing number of locations were considered and designated by the most of them in or near centers of population and one on the Ozarks Recreational Demonstration Area in Missouri. Three camps with a capacity of approximately 20,000 men were constructed in 23 States and the District of Columbia.

Rest and Relaxation for British Sailors

When the American shipyards were thrown open to the Navy, the British Advisory Repair Mission was faced with the problem of making provision for the crews of these vessels that permit the sailors to get away from the sea for as complete a change of scene as possible. The group-camping facilities in the recreational demonstration areas and five vacant CCC camps were offered to the British Navy through the United States Navy. These areas have been used by approximately 10,000 British sailors who have been accommodated in them for periods ranging from 3 days to 10 days.

Recently the National Park Service has been called upon to select or arrange for additional temporary housing for British crews in addition to the use being made of the recreational demonstration areas. The Service has been able to transfer strategically located CCC camps to the United States Navy for this purpose.

War Use of Park Areas in the Nation's Capital

Adaptation to wartime conditions has been a matter of prime concern to the District of Columbia and the National Capital Parks during the fiscal year. Not only has military occupancy of park areas been arranged, but it has been necessary to construct temporary war buildings in the Mall, West Potomac Park, the President John F. Kennedy Park, the Washington Monument Grounds, and the George Washington Memorial Parkway.

The result of this military need was the withdrawal from public use of approximately 30 percent of the major recreational facilities in the National Capital Parks. The replacement of these facilities at other locations is gradually being accomplished to meet the needs of the increasing population of the Nation's Capital.

Fort Washington, Md., and Fort Hunt, Va., were taken over by the War Department, and the protection of the Washington waterways necessitated closing to public use certain sections of the Chesapeake and Ohio Canal.

Travel to the National Park Areas

Although the National Park Service is accustomed to reporting large annual increases in travel, this year's figures show a decrease of 50 percent from last year, and travel for the month of June 1942, as compared to June 1941, showed a 50 percent decrease. However, an impressive total of approximately 16,030,000 visitors, including an estimated 650,000 members of the armed forces, visited the Federal park areas between July 1, 1941, and June 30, 1942, approximately 10,000 of whom were visitors after December 1941. The rubber and gasoline shortages, the need of conserving transportation equipment for use by the military and war agencies, and the limited vacations of workers in war industries made advisable the curtailment of motion of park attendance not only by the National Park Service but also to a large extent by the park operators. Two meetings of representatives of the park operators were held with the Director after the declaration of war. Insofar as was consistent with the changing war program and the position taken by higher authority, it was agreed that the parks would remain open and public-service facilities would be made available to provide accommodations for the people who are able to visit the parks. Special reduced rates were continued in effect for members of the armed forces. The park superintendents were delegated authority to adjust rates and services to meet the rapidly changing war conditions.

Analysis of the travel figures since the outbreak of war shows that while the number of visitors decreased the per capita day use of park areas increased. Most of the people who were able to visit the parks and monuments remained for a longer period than in previous years. In accordance with orders from the Office of Defense Transportation, all sightseeing and charter bus service was brought to a close in the national parks and monuments. Transportation from rail and bus terminals to established destinations such as the hotels and lodges within the parks has been maintained.

Visitation to Hawaii National Park, Hawaii, and Mount McKinley National Park, Alaska, was stopped by the outbreak of the war. The superintendents of those areas and their staffs, however, continued to protect them, to assist with local civilian defense programs, and to make park features available to the members of the armed forces and civilians in the vicinity.

National Park Concessions, Inc., the nonprofit distributing corporation authorized by the Secretary of the Interior in 1941 to operate public facilities at Mammoth Cave National Park, Ky., completed a year of successful operations. One concession unit was established at the Blue Ridge Parkway and plans are being made for the post-war

As the first six camps approached completion, a steadily increasing number of locations were considered and designated by the Army, most of them in or near centers of population and one on the Lake of the Ozarks Recreational Demonstration Area in Missouri. Thirty-three camps with a capacity of approximately 20,000 men were constructed in 23 States and the District of Columbia.

Rest and Relaxation for British Sailors

When the American shipyards were thrown open to the British Navy, the British Advisory Repair Mission was faced with the problem of making provision for the crews of these vessels that would permit the sailors to get away from the sea for as complete a change of scene as possible. The group-camping facilities in the recreational demonstration areas and five vacant CCC camps were offered to the British Navy through the United States Navy. These areas have been used by approximately 10,000 British sailors who have been accommodated in them for periods ranging from 3 days to 10 weeks.

Recently the National Park Service has been called upon to supply or arrange for additional temporary housing for British crews. In addition to the use being made of the recreational demonstration areas, the Service has been able to transfer strategically located CCC camps to the United States Navy for this purpose.

War Use of Park Areas in the Nation's Capital

Adaptation to wartime conditions has been a matter of principal concern to the District of Columbia and the National Capital Parks during the fiscal year. Not only has military occupancy of some park areas been arranged, but it has been necessary to construct temporary war buildings in the Mall, West Potomac Park, the President's Park, the Washington Monument Grounds, and the George Washington Memorial Parkway.

The result of this military need was the withdrawal from public use of approximately 30 percent of the major recreational facilities of the National Capital Parks. The replacement of these facilities at other locations is gradually being accomplished to meet the needs of the increasing population of the Nation's Capital.

Fort Washington, Md., and Fort Hunt, Va., were taken over by the War Department, and the protection of the Washington water supply necessitated closing to public use certain sections of the Chesapeake & Ohio Canal.

Travel to the National Park Areas

Although the National Park Service is accustomed to reporting large annual increases in travel, this year's figures show a decrease of 30 percent from last year, and travel for the month of June 1942, as compared to June 1941, showed a 50 percent decrease. However, an impressive total of approximately 16,030,000 visitors, including an estimated 650,000 members of the armed forces, visited the Federal park areas between July 1, 1941, and June 30, 1942, approximately 4,000,000 of whom were visitors after December 1941. The rubber and gasoline shortages, the need of conserving transportation equipment for use by the military and war agencies, and the limited vacations of workers in war industries made advisable the curtailment of promotion of park attendance not only by the National Park Service but also to a large extent by the park operators. Two meetings of representatives of the park operators were held with the Director after the declaration of war. Insofar as was consistent with the changing war program and the position taken by higher authority, it was agreed that the parks would remain open and public-service facilities would be made available to provide accommodations for the people who are able to visit the parks. Special reduced rates were continued in effect for members of the armed forces. The park superintendents were delegated authority to adjust rates and services to meet the rapidly changing war conditions.

Analysis of the travel figures since the outbreak of war shows that while the number of visitors decreased the per capita day use of park areas increased. Most of the people who were able to visit the parks and monuments remained for a longer period than in previous years.

In accordance with orders from the Office of Defense Transportation, all sightseeing and charter bus service was brought to a close in the national parks and monuments. Transportation from rail and bus terminals to established destinations such as the hotels and lodges within the parks has been maintained.

Visitation to Hawaii National Park, Hawaii, and Mount McKinley National Park, Alaska, was stopped by the outbreak of the war. The superintendents of those areas and their staffs, however, continued to protect them, to assist with local civilian defense programs, and to make park features available to the members of the armed forces and civilians in the vicinity.

National Park Concessions, Inc., the nonprofit distributing corporation authorized by the Secretary of the Interior in 1941 to operate public facilities at Mammoth Cave National Park, Ky., completed a year of successful operations. One concession unit was established on the Blue Ridge Parkway and plans are being made for the post-war

operation of facilities by this corporation along the entire length of the parkway.

Travel Bureau Operates on War Basis

The program of the Travel Bureau—established by Congress in 1940 and placed under the supervision of the National Park Service—was revised to eliminate promotion of travel. The field offices in New York and San Francisco were closed. A small force is continuing in Washington to serve as a liaison agency in supplying essential information to the travel industry, to war agencies, and to the public. The travel interests of the country, in collaboration with the Bureau, set up the North American Travel Conference, the keynote for which was the utilization of available recreational travel facilities to keep war workers and the public fit for their patriotic duties. This conference first promoted the idea of staggered vacations which later was established as an official policy. Through the Interdepartmental Committee in Cooperation with the American Republics in forwarding the Good Neighbor Policy, and under an allotment of \$25,000 from that committee, the Travel Bureau, assisted by the Photographic Section of the Division of Information, scored 12 reels of film in Spanish and Portuguese for distribution by the State Department to the American Republics.

Problems of Protection Growing Out of the War

In connection with the war program there have arisen proposals to open national park areas to lumbering, mining, grazing, and other commercial exploitation. These present a problem of major importance. The National Park Service is aware that the cost of victory in this war is going to be high and that our natural resources are going to be called upon more and more to meet the shortages in available strategic materials. It is the responsibility of this Service to measure the degree to which the justified needs of the Nation require destruction of irreplaceable national park values and to recommend accordingly. Inconvenience to park administration and to park visitors or remediable damage to park property have not been considered sufficient reasons for questioning the use of park resources for war purposes. Only where uses proposed would do irreparable damage and entail destruction or impairment of distinctive features and qualities in the parks have we felt justified in raising the question as to whether all reasonable alternatives have been exhausted before invading the national park areas. Critical necessity rather than convenience should, we believe, be the governing reason.

This test applies, for instance, to such proposals as that for the logging of airplane spruce in Olympic National Park. The shortage of Sitka spruce for airplane manufacture is recognized as a direct threat to perpetuation of these forests in Olympic National Park. This area has served its highest public use by preserving for the enjoyment of future generations a representative remnant of the vast virgin forests that once were the glory of the Pacific Northwest. Once gone, an outstanding natural spectacle is lost to America forever. The consensus of conservation leaders is that none of the virgin forest in this park should be cut unless the trees are absolutely essential to the prosecution of the war, with no alternative, and only as a last resort. Other spruce should first be used. Supplies from Alaska and from Washington and Oregon are being made available for this purpose, and the Service is cooperating in the provision of some airplane spruce by modifying the taking lines of the Coastal Strip and the Queets Corridor Parkway adjoining Olympic National Park. The Service is following the situation closely, and at each turn of the war program we shall take a position dictated by paramount national need.

Similarly with proposals to mine strategic minerals in the national parks and monuments, the position has been taken that invasion of a national park by mining can be justified only to furnish strategic or critical minerals indispensable to the war and not obtainable elsewhere. In general, studies indicate that strategic minerals are not present in national park areas in sufficient quantities to be of economic importance, but the Service, in collaboration with the Geological Survey, stands ready to aid in determination of the Nation's highest interest in the matter of sacrifices necessary to provide war materials.

The long-range departmental policy of eventually eliminating grazing from all national parks and monuments has been reaffirmed. Land-management studies prove that a small acreage of cultivated pasture is equal to many thousand acres of mountain grazing. The ruinous erosion caused by overgrazing and the spoiling of mountain meadows and streams and serious conflicts with recreational use—all are ample justification for not permitting grazing within the national parks and monuments. Destruction to roads, trails, and improvements by trampling, and the expense of developing water, fences, and other facilities would render such proposed grazing uneconomical; therefore, it has been held that any extension of grazing in aid of the demands caused by the war should be made only after all other possibilities have been exhausted.

In these and other cases where destructive uses of national park lands are proposed for war purposes the Service does not take a hide-

bound position, but rather one of full attempt to cooperate with the military authorities in determining whether the need is critical for the Nation or merely convenient for some individual operation, and whether the need can be met expeditiously somewhere else without destruction of the qualities of the national parks.

Protection of Cultural Resources

Through representation on the President's Committee on the Conservation of Cultural Resources; by surveying and recording materials of cultural, scientific, and historic importance in its possession; by storing irreplaceable items at places which are considered safer than their original repositories; and in the preparation of the handbook issued by the committee, chapter 4 of which on the protection of historic buildings is almost entirely the work of members of our staff, the National Park Service has aided this important phase of civilian defense.

Members of our staff are alert and prepared to protect historical, scientific, and other irreplaceable exhibits that have been entrusted to our care. The Service has cooperated with Federal, State, and local agencies and has worked with the Committee on the Conservation of Cultural Resources, the Office of Civilian Defense, and the Public Buildings Administration in developing plans for the protection of historic buildings and cultural materials.

Public Use of Historic Sites

In recognition of the fact that a nation without physical reminders of its past heroism and military exploits would have little enduring national pride, the Service not only kept its historical areas open as in normal times, but also lengthened the hours of visitation and extended and improved its interpretive programs. Close proximity of these areas to Army and Navy centers provided many soldiers, sailors, and marines with opportunities for recreation and patriotic stimulation, and special programs were arranged for them by National Park Service personnel.

Much was done to perfect and intensify the basic contribution of the historical and military parks to the strengthening of morale. Special theme studies were undertaken to redefine and fortify the National Park Service interpretation of the great movements and crises of American history. Interpretive statements were reexamined and in many cases revised to show how each historical area is an integral part of the theme of the building of America.

On Guard in the Nation's Forests

The agencies in charge of the Nation's forests face perhaps the most critical fire season in history. The National Park Service is cooperatively with the U. S. Forest Service and with State and conservation agencies. Acute threats of sabotage and incendiarism increase the normal protection problem—always a serious one—and it is further intensified by reduction in available manpower for prevention and suppression activities.

The loss of the Civilian Conservation Corps on June 30 and the withdrawal from the forested areas of large numbers of trained fire fighters seriously complicated the fire-protection program. Immediate steps were taken to locate sources of local labor and to train every available Civilian Conservation Corps employee in the essential elements of combating forest fires. Civilian public service camps, composed of conscientious objectors, were able to do effective work in combating a large forest fire in the vicinity of the Blue Ridge Parkway. Plans of the Selective Service Administration for locating additional camps of this type in forested areas are under way.

During the 1941 season, lightning caused more fires than in any other year of record—over one-third of the 540 forest fires reported in parks. A total of 3,788 acres of forest and brush lands were burned throughout the entire system. In addition, 25,000 acres of woodland in the Lava Beds National Monument were burned over by lightning-caused fires.

Although fires started by careless smokers continue to be the most prevalent of the human causes of forest fires in the national parks, the intensified fire-prevention program has given encouraging results in that the total number of preventable man-caused fires has not increased in proportion to park use.

Measured by acres, the park forests represent a relatively small part of the forested area of the United States and its Territories. Nevertheless, aside from the aesthetic value, strategic location makes them of great significance to the Nation. Situated primarily on mountain peaks and in high country, their preservation is essential to the protection of watersheds vital to water supply, agriculture, and power.

Protection Against Forest Insects and Diseases.

The forest insect situation in the National Park System is favorable because of thoroughness of previous intensive control programs. A limited outbreaks still require control work. Continual vigilance, however, must be exercised to assure recognition of epidemics at an early stage. Regular surveys and prompt control of infestations are of

greater importance now than in normal times because of limited power available.

The white pine blister rust continues to spread among the needle pines. Over a third of a million acres of pine forests in national park areas warrant intensive control work. The program was accelerated during the past year through appropriation of funds. Complete control work has been carried out on 66,793 acres.

Loss of Civilian Conservation Corps Camps

Reduction of the Civilian Conservation Corps during 1942 and its abolishment in the 1943 fiscal year as a wartime economy measure caused the National Park Service a serious loss of manpower. In 1933 the Service has depended to a large extent upon the CCC men to fight forest fires, maintain trails, install recreational facilities and carry on general measures of conservation and protection. In the reorganization of regular Service personnel has been necessary to establish the basis on which many of these protective functions will be conducted in the future.

The number of CCC camps under the technical supervision of the Service was reduced from 262 in July 1941 to 91 by June 30, 1942. Throughout the year as camps were required they were assigned to Army and Navy areas. In the Hawaiian Islands, the corps as a whole was allocated to war projects. The St. Thomas camp in the Virgin Islands was discontinued early in the year as defense work precluded employment for all available youth.

By the end of July 1942, all of the CCC camps will be terminated, bringing to a close a 9-year cooperative program that has been of inestimable value in park development and protection. Although this will be reported upon in the 1943 report, we now salute the CCC and acknowledge the aid the National Park Service has received from CCC activities throughout the Nation.

Construction Work Deferred

Along with other civilian agencies of the Federal Government the National Park Service has virtually halted all construction and development for the duration of the war. New work was deferred as reductions were being made even before mandatory restrictions were issued by the War Production Board. Many members of the Service engaged in planning and construction joined the armed forces or other agencies. The Service has made its shift to a war basis for the duration with little difficulty.

The suspension of construction activities affords an excellent opportunity for careful and thorough formulation of plans for future development.

nucleus of the planning branches is being retained in each of the national headquarters and the Director's office. The first call on the services of these employees will be to meet emergency conditions that may arise. The remainder of their time will be devoted to a "plans-on-shelf" program, which the Service has been instructed to prepare. This should prove to be an important element in any accelerated planning program that may be decided upon to take up the slack in employment that may well be anticipated at the end of the war. This will also assure mature and sound plans for any future program of development. The benefit of a "breathing spell" in the matter of construction and development is recognized by the Service.

Parkways

The National Park Service and Public Roads Administration are drafting a long-range plan for resuming development of the Blue Ridge and the Natchez Trace Parkways after the war. The Blue Ridge Parkway ultimately will connect the Shenandoah National Park in Virginia and the Great Smoky Mountains National Park in North Carolina and Tennessee, a distance of 484 miles. Appropriations and allotments to date for the Blue Ridge Parkway have totaled \$1,518,047.33, and more than two-thirds of the total mileage has been completed, with one continuous stretch of bituminous surfaced road between Adney Gap, near Roanoke, Va., and Deep Gap, near Bowling Rock, N. C., a distance of 150 miles.

On the Natchez Trace Parkway, which follows the general location of the Old Indian Trail between Nashville, Tenn., and Natchez, Miss., known as the "Natchez Trace," some work is being completed under contracts issued prior to the war, and as the present construction proceeds to a close 37 miles have been graded and surfaced out of a total of 145 miles, and 83 additional miles have been graded.

Master Plans

As a basis for the planning program of the national park and monument areas, a Master Plan Manual was issued for the guidance of administrative and professional employees of the Service. The Master Plan is the controlling document which governs the orderly development of all areas administered by the National Park Service. Its purpose is to assure the soundness of that development and to coordinate the thought and effort of all persons engaged in establishing the policies which govern an area's preservation, interpretation, administration, and operation. During the 1942 fiscal year, the Service brought to completion and approval master plans for all 166 units of the National Park System. Based on these, development

programs were submitted to the National Resources Planning Board as a basis of the 6-year advance plan and program of Public Works construction submitted annually.

Interpretation

An "inventory of values" describing the outstanding features of each area and defining the significance of those features in relation to human experience has been prepared for many of the natural and historical areas of the Service. These inventories are the result of collaboration and research of various technicians, and serve as the basis for interpretive statements for each area. They are of particular importance in the master-planning program.

Soldiers, sailors, war workers, and civilian visitors to the national parks and monuments were given an opportunity to gain a better understanding of the inspirational, historical, and educational significance of these areas through the guided trips and illustrations given by the naturalists and historians, and the field museums operated by the Service.

Interpretive activities were cut to a war pattern. Guided tours calling for the use of private cars (frequently referred to as "car trips") were practically eliminated, and scheduled hiking trips were curtailed. The Yosemite School of Field Natural History, which for many years served as a training ground for naturalists, and the Yosemite Junior Nature School were discontinued for the period of the war.

Many technical, semitechnical, and popular publication periodicals were postponed or suspended indefinitely to avoid the expense of paper and printing facilities needed for emergency work and to avoid possible personnel reductions. The preparation of a series of interpretive programs was abandoned, as were the monthly "clip sheets" and "bulletins" with phases of conservation in popular vein.

Museums

Museum exhibits have been directed toward the primary purpose of each area in strengthening patriotic thought. One typical example, "What We Fight For," was installed at the historical museum at Morristown National Historical Park. It presented in graphic form the ideals of freedom of worship and freedom of speech as expressed by George Washington.

The Western Museum Laboratories in California closed at the termination of Work Projects Administration programs, and the preparation of museum exhibits has been curtailed throughout the Service.

Among the acquisitions of scientific and historical materials

the Wirt Robinson Indian Collection which was installed in the museum on Jamestown Island section of Colonial National Historical Park, and the John Nelson Collection of objects relating to the prehistoric Indians who lived in the vicinity and visited the Mammoth Cave, which were gathered over a long period of years by John Nelson, a former cave guide, and were purchased by the Mammoth Cave National Park Association and donated to the park. They will form the basis for an interpretive museum exhibit and study material.

The Advisory Board

The Advisory Board on National Parks, Historic Sites, Buildings, and Monuments met twice during the year to consider policies involved in the preservation and use of national park and monument areas during the war. The interest of this Board and their helpful recommendations to the Secretary are of great value to the Service. The members are: Edmund H. Abrahams, chairman; Dr. Clark Wissler, vice chairman; Dr. Frank M. Setzler, Secretary; and Dr. Thomas Barbour, Dr. Herbert E. Bolton, Mrs. Reau Folk, George deBenneville Keim, Dr. Fiske Kimball, Dr. Waldo G. Leland, Richard Lieber, and Charles G. Sauers.

Archeology

The National Park Service in collaboration with the Bureau of Reclamation, Office of Indian Affairs, Tennessee Valley Authority, and Work Projects Administration reviewed, investigated, and conducted many important archeological studies. Typical of these was the archeological reconnaissance and obtaining of scientific data relating to the little-known period of cave habitation belonging to the early Basket Maker development from the Yampa and Green River drainage basins in Dinosaur National Monument, soon to be inundated by project dams and reservoirs, and, also, the salvaging of important archeological data and collections at Mancos Canyon, near Mesa Verde National Park. By the end of the fiscal year, archeological programs under the Work Projects Administration on which this Service and the Smithsonian Institution have given technical review were greatly reduced, and all excavations on national park areas were brought to a close.

Wildlife Conservation

The National Park Service continued its cooperative relationships with the Fish and Wildlife Service on important wildlife problems. Recognizing that the sight of animals, large and small, in their natural

habitat is an integral part of the American scene as exemplified in the national parks, efforts were directed toward wildlife management in its broad phases.

During the past year wildlife experts recommended reductions in the number of so-called "big game" and the fur-bearing animals, in order to relieve overpopulation of the range and guard against deterioration of these animals through starvation and disease that accompany continuously overstocked ranges.

The greatest problems occurred in Yellowstone National Park, which contains the largest mammal population of any unit in the system. Although the winter range which is shared by elk, deer, antelopes, and bighorn showed some improvement, this was due primarily to weather conditions, particularly mild winters that made it possible for the big animals to graze in the high country, thus relieving the regular winter range of its usual grazing burden. To prevent further jeopardy of the range, and guard against wildlife disaster in an unexpectedly severe winter, it is necessary to reduce the large existing elk surplus and maintain the herd at less than carrying capacity until the range has fully recovered.

A too-large bison population is another Yellowstone problem. During the year a program was inaugurated for reduction of the Lamar bison herd leading to its eventual establishment on a self-sustaining basis. In all 183 bison were disposed of to Indians, relief agencies, and the San Rafael Grazing District, Utah.

Elk, deer, and beaver in other areas were reduced, some being used for stocking purposes on non-Federal areas.

A comprehensive analysis of grazing by saddle stock in Kings Canyon National Park was prepared as a basis for a protective program for meadows and open areas and to insure proper watershed and wildlife forage.

To assist in rendering the Hawaiian Islands as nearly self-sustaining as possible, grazing was authorized on Hawaii National Park lands found adaptable therefor.

Fish Conservation

Heavy plantings of fish were continued, with the release of 22 million fish (eggs, fry, fingerlings, etc.) in waters of 20 park areas. Most of the planting stock was supplied by Fish and Wildlife Service hatcheries. Rearing pools were operated by the National Park Service in Great Smoky Mountains, Rocky Mountain, and Sequoia National Parks.

A uniform series of cooperative agreements was entered into between the Service and the California Division of Fish and Game governing fish-stocking procedure for each of the national parks in California.

In addition to these annual agreements, a general policy agreement was reached between the National Park Service, Fish and Wildlife Service, and California Division of Fish and Game.

Soil and Moisture Conservation

In accordance with the program of the Department's Office of Land Utilization, much important work was accomplished in soil and moisture conservation, particularly in the Southwest.

The engineering laboratory of the Service made soils and building material analyses. Architectural concrete researches were made to determine effect and weathering quality of integral colored pigments and surface stains of importance in camouflage. Continued assistance was given the Bureau of Yards and Docks of the Navy Department, both in performance of tests and in the use of laboratory facilities by naval personnel. In collaboration with the National Bureau of Standards, further investigations were made of cement-stabilized soils.

Sanitation and Safety Precautions

Close cooperation was continued with the Public Health Service in maintaining proper sanitation conditions throughout the National Park System. Sanitary engineers of the Public Health Service inspected water supplies, sewerage and sewage disposal, garbage disposal, camp and picnic grounds, swimming pools, and food-handling places throughout the system. No critical problems of sanitation arose.

In-Service training courses in fire-protection engineering were given groups of selected engineers and architects, to familiarize the personnel with the principles and safe practices of fire protection as they apply to the design, construction, and operation of building and auxiliary equipment.

The trend of employee accidents continued downward, with a reduction of more than 70 percent in the compensation costs for employee injuries since the establishment of a safety unit in the National Park Service in 1937. This record is especially noteworthy since for the 5 years preceding 1937 there was a rising trend of employee injury costs.

Cooperation in State Park and Related Development

Early in 1942 the Service published its report on A Study of the Park and Recreation Problem of the United States which was based to a considerable extent upon information obtained through the various

State park, parkway, and recreational area studies. Its greatest value will be in planning future programs, especially during the post-war period.

The total of State reports was increased to 36 with the completion of those for Vermont and West Virginia.

Regional park and recreation studies of New England and the Central Southeast, launched in the preceding year, were suspended for the duration. A long-range study of the recreational resources of the Denison Dam, Texas and Oklahoma, was initiated under a special congressional appropriation. The 1940 quinquennial survey of county and municipal parks, conducted in cooperation with the National Recreation Association and the American Institute of Park Executives, was completed.

The reduction in the number of Civilian Conservation Corps camps throughout the year, and the redirection of CCC work to activities contributing directly to the protection of vital resources and to the military effort, resulted in virtual elimination of State, county, and metropolitan park projects.

All States that had benefited from this cooperative enterprise were advised, in anticipation of some form of Federal assistance when the war is ended, to work along three main lines: (1) perfection of their administrative and technical organizations; (2) building up their land ownership, particularly to round out existing parks; and, (3) continued preparation of adequate plans for future development.

Drainage Basin Activities

An important part of the Service's cooperative planning work during the year was the study of the recreational resources of the various drainage basins throughout the country. This is a part of the continuing program of drainage basin studies carried on by Federal, State, and local authorities under general auspices of the National Resources Planning Board.

Contributions of planning advice through regular attendance at drainage basin meetings were made in connection with the current studies in a number of other basins throughout the country. Despite loss of personnel Service representation continued on all drainage basin committees.

A plan for the utilization of the recreational resources created by development of the Grand Coulee Reservoir in the State of Washington was completed and turned over to the Bureau of Reclamation. The work was done at the request of that bureau as a part of the complete analysis of the project's resources and possibilities. A start was made on similar planning for the Central Valley project in California.

In cooperation with the Bureau of Reclamation, as a part of the studies to formulate a comprehensive plan for the utilization of the resources of the Colorado River Basin, a recreational survey was in progress throughout the year. Special emphasis was placed upon the most vital water conservation possibilities, suggested by the Bureau of Reclamation at points along the Colorado and Green Rivers.

International Cooperation in Conservation

Of significance in the preservation of the natural attributes of the Americas is the Convention on Nature and Wildlife Protection in the Western Hemisphere.

The necessary number of Governments ratified the convention during the past year, and it came into force on April 30, 1942. The treaty establishes conservation principles that will be of great value in preserving the natural conditions, birds, and animals of the Western Hemisphere.

The National Park Service has exchanged information with the Cultural Relations Division of the State Department and the Hispanic Foundation of the Library of Congress concerning legislation, classification, protection, and treatment of historic sites. Representatives of Brazil, Peru, Colombia, and Guatemala visited Washington and a number of the national parks to study park operation, stabilization methods, legislation and administrative methods used, and archeological conservation.

Great Britain now is making plans for nature preservation in its post-war construction, through its municipal corporations and scientific societies.

At meetings in Mexico City, representatives of the United States and Mexico made recommendations to carry out the act of August 18, 1941, authorizing the establishment of the Coronado International Memorial on the international boundary between the States of Arizona and Sonora.

Additions to the National Park System

One new national monument was established during the past year, bringing the total number of units of the National Park System to 166. This new unit and additions to existing units increased the total area of the system to 21,686,029 acres.

The Andrew Johnson National Monument, with a total area of 17 acres, was established by Presidential proclamation of April 27, 1942, pursuant to the act of August 25, 1935. The State of Tennessee donated the Andrew Johnson Tailor Shop property at Greeneville, where the former President engaged in his trade from 1826 to 1843;

State park, parkway, and recreational area studies. Its greatest value will be in planning future programs, especially during the post-war period.

The total of State reports was increased to 36 with the completion of those for Vermont and West Virginia.

Regional park and recreation studies of New England and the Central Southeast, launched in the preceding year, were suspended for the duration. A long-range study of the recreational resources of the Denison Dam, Texas and Oklahoma, was initiated under a special congressional appropriation. The 1940 quinquennial survey of county and municipal parks, conducted in cooperation with the National Recreation Association and the American Institute of Park Executives, was completed.

The reduction in the number of Civilian Conservation Corps camps throughout the year, and the redirection of CCC work to activities contributing directly to the protection of vital resources and to the military effort, resulted in virtual elimination of State, county, and metropolitan park projects.

All States that had benefited from this cooperative enterprise were advised, in anticipation of some form of Federal assistance when the war is ended, to work along three main lines: (1) perfection of their administrative and technical organizations; (2) building up their land ownership, particularly to round out existing parks; and, (3) continued preparation of adequate plans for future development.

Drainage Basin Activities

An important part of the Service's cooperative planning work during the year was the study of the recreational resources of the various drainage basins throughout the country. This is a part of the continuing program of drainage basin studies carried on by Federal, State, and local authorities under general auspices of the National Resources Planning Board.

Contributions of planning advice through regular attendance at drainage basin meetings were made in connection with the current studies in a number of other basins throughout the country. Despite loss of personnel Service representation continued on all drainage basin committees.

A plan for the utilization of the recreational resources created by development of the Grand Coulee Reservoir in the State of Washington was completed and turned over to the Bureau of Reclamation. The work was done at the request of that bureau as a part of the complete analysis of the project's resources and possibilities. A start was made on similar planning for the Central Valley project in California.

In cooperation with the Bureau of Reclamation, as a part of the studies to formulate a comprehensive plan for the utilization of the resources of the Colorado River Basin, a recreational survey was in progress throughout the year. Special emphasis was placed upon the most vital water conservation possibilities, suggested by the Bureau of Reclamation at points along the Colorado and Green Rivers.

International Cooperation in Conservation

Of significance in the preservation of the natural attributes of the Americas is the Convention on Nature and Wildlife Protection in the Western Hemisphere.

The necessary number of Governments ratified the convention during the past year, and it came into force on April 30, 1942. The treaty establishes conservation principles that will be of great value in preserving the natural conditions, birds, and animals of the Western Hemisphere.

The National Park Service has exchanged information with the Cultural Relations Division of the State Department and the Hispanic Foundation of the Library of Congress concerning legislation, classification, protection, and treatment of historic sites. Representatives of Brazil, Peru, Colombia, and Guatemala visited Washington and a number of the national parks to study park operation, stabilization methods, legislation and administrative methods used, and archeological conservation.

Great Britain now is making plans for nature preservation in its post-war construction, through its municipal corporations and scientific societies.

At meetings in Mexico City, representatives of the United States and Mexico made recommendations to carry out the act of August 18, 1941, authorizing the establishment of the Coronado International Memorial on the international boundary between the States of Arizona and Sonora.

Additions to the National Park System

One new national monument was established during the past year, bringing the total number of units of the National Park System to 166. This new unit and additions to existing units increased the total area of the system to 21,686,029 acres.

The Andrew Johnson National Monument, with a total area of 17 acres, was established by Presidential proclamation of April 27, 1942, pursuant to the act of August 25, 1935. The State of Tennessee donated the Andrew Johnson Tailor Shop property at Greeneville, where the former President engaged in his trade from 1826 to 1843;

State park, parkway, and recreational area studies. Its greatest value will be in planning future programs, especially during the post-war period.

The total of State reports was increased to 36 with the completion of those for Vermont and West Virginia.

Regional park and recreation studies of New England and the Central Southeast, launched in the preceding year, were suspended for the duration. A long-range study of the recreational resources of the Denison Dam, Texas and Oklahoma, was initiated under a special congressional appropriation. The 1940 quinquennial survey of county and municipal parks, conducted in cooperation with the National Recreation Association and the American Institute of Park Executives, was completed.

The reduction in the number of Civilian Conservation Corps camps throughout the year, and the redirection of CCC work to activities contributing directly to the protection of vital resources and to the military effort, resulted in virtual elimination of State, county, and metropolitan park projects.

All States that had benefited from this cooperative enterprise were advised, in anticipation of some form of Federal assistance when the war is ended, to work along three main lines: (1) perfection of their administrative and technical organizations; (2) building up their land ownership, particularly to round out existing parks; and, (3) continued preparation of adequate plans for future development.

Drainage Basin Activities

An important part of the Service's cooperative planning work during the year was the study of the recreational resources of the various drainage basins throughout the country. This is a part of the continuing program of drainage basin studies carried on by Federal, State, and local authorities under general auspices of the National Resources Planning Board.

Contributions of planning advice through regular attendance at drainage basin meetings were made in connection with the current studies in a number of other basins throughout the country. Despite loss of personnel Service representation continued on all drainage basin committees.

A plan for the utilization of the recreational resources created by development of the Grand Coulee Reservoir in the State of Washington was completed and turned over to the Bureau of Reclamation. The work was done at the request of that bureau as a part of the complete analysis of the project's resources and possibilities. A start was made on similar planning for the Central Valley project in California.

In cooperation with the Bureau of Reclamation, as a part of the studies to formulate a comprehensive plan for the utilization of the resources of the Colorado River Basin, a recreational survey was in progress throughout the year. Special emphasis was placed upon the most vital water conservation possibilities, suggested by the Bureau of Reclamation at points along the Colorado and Green Rivers.

International Cooperation in Conservation

Of significance in the preservation of the natural attributes of the Americas is the Convention on Nature and Wildlife Protection in the Western Hemisphere.

The necessary number of Governments ratified the convention during the past year, and it came into force on April 30, 1942. The treaty establishes conservation principles that will be of great value in preserving the natural conditions, birds, and animals of the Western Hemisphere.

The National Park Service has exchanged information with the Cultural Relations Division of the State Department and the Hispanic Foundation of the Library of Congress concerning legislation, classification, protection, and treatment of historic sites. Representatives of Brazil, Peru, Colombia, and Guatemala visited Washington and a number of the national parks to study park operation, stabilization methods, legislation and administrative methods used, and archeological conservation.

Great Britain now is making plans for nature preservation in its post-war construction, through its municipal corporations and scientific societies.

At meetings in Mexico City, representatives of the United States and Mexico made recommendations to carry out the act of August 18, 1941, authorizing the establishment of the Coronado International Memorial on the international boundary between the States of Arizona and Sonora.

Additions to the National Park System

Great Britain now is making plans for nature preservation in its post-war construction, through its municipal corporations and scientific societies.

At meetings in Mexico City, representatives of the United States and Mexico made recommendations to carry out the act of August 18, 1941, authorizing the establishment of the Coronado International Memorial on the international boundary between the States of Arizona and Sonora.

Additions to the National Park System

One new national monument was established during the past year, bringing the total number of units of the National Park System to 166. This new unit and additions to existing units increased the total area of the system to 21,686,029 acres.

The Andrew Johnson National Monument, with a total area of 17 acres, was established by Presidential proclamation of April 27, 1942, pursuant to the act of August 25, 1935. The State of Tennessee donated the Andrew Johnson Tailor Shop property at Greeneville, where the former President engaged in his trade from 1826 to 1843;

the War Department transferred the Andrew Johnson National Cemetery; and the Andrew Johnson Homestead was purchased, bringing together the essential properties for establishment of the monument.

Additions were made to 25 existing units through the purchase of 2,503 acres; the acquisition by donation of 4,285 acres; and the transfer of 28,608 acres already in Government ownership.

Progress of National Park Projects

Consummation of several major national park projects appears possible at the close of the year, and good progress on several others can be reported.

The Big Bend National Park project, launched in Texas over 10 years ago and authorized by the act of June 20, 1935, approaches successful conclusion as the State of Texas acquired title to more than 600,000 acres of land within the proposed park boundaries. Additional purchases are expected to bring the total to approximately 710,000 acres by September 1, after which no further expenditure can be made against the \$1,500,000 appropriated by the State Legislature for that purpose. Land acquisition was handled by the Texas State Park Board. The Republic of Mexico plans to establish eventually a similar national park on the opposite side of the Rio Grande. The two will form an international park on our southern border similar to the Waterton-Glacier International Peace Park on the Canada-United States boundary.

The Everglades National Park project was authorized by act of June 30, 1934. Negotiations with the State of Florida were continued and considerable progress was made during the past year to formulate plans to exchange miscellaneous State lands for privately owned lands within the project boundaries, and the eventual transfer of the lands to the Federal Government. The Governor of Florida has expressed wholehearted interest in this projected park.

Coronado International Memorial, Arizona.—By act of August 1, 1941, the Congress authorized the establishment of a memorial in Arizona to commemorate the explorations of Francisco Vasquez de Coronado. An area of 2,880 acres of land adjoining the international boundary and located about 10 miles west of the town of Nogales has been selected for this purpose. The act provides that a Presidential proclamation establishing the memorial shall be issued when the Government of Mexico has established, or provided for the establishment of, an adjoining area of similar type and size in the State of Sonora.

At a conference held in Mexico City in June attended by representatives of the United States Government and Arizona and the Government of Mexico arrangements were made to survey the area proposed for the memorial in the State of Sonora so that a definite

to be issued by the President of Mexico establishing it as the Coronado International Memorial Park. The uses, functions, development, and administration of the Coronado International Memorial, comprising areas on each side of the international boundary, also were outlined at the conference. This international memorial, when established, will symbolize the unity existing between Mexico and the United States.

Cumberland Gap National Historical Park project, Kentucky, Tennessee, and Virginia, was authorized by act of June 11, 1940. A recent appropriation for land acquisition by the Kentucky Legislature of 50,000 brought this project nearer realization. The State of Tennessee had previously appropriated \$75,000 with which to acquire its portion of the tri-State area. Virginia has completed its surveys and negotiations with funds allocated for the purpose and has indicated that 5,000 will be forthcoming with which to exercise the options.

Cape Hatteras National Seashore Recreational Area project, North Carolina, was authorized by act of August 17, 1937, and redesignated by the act of June 29, 1940. During the past year the Cape Hatteras Seashore Commission has been successful in securing more than 7,000 acres, mostly in lands belonging to the State and to Dare County, for conveyance to the Federal Government. At least 10,000 acres must be acquired before the area, which will include the existing Kill Devil Hill Memorial National Monument, Fort Raleigh National Historic Site, and Cape Hatteras Lighthouse, can be established.

Saratoga National Historical Park project, New York, was authorized by act of June 1, 1938. Title to most of the area was conveyed to the United States by the State of New York in 1941. Options have been obtained on more than one-half of the remaining lands which must be acquired before the park can be formally established.

Encouraging as are the foregoing gains, the Service realizes that effective means have not yet been found to save some unique areas that are worthy of preservation, the status of which is critical. The Caddo River forest in Madison Parish, La., and the Porcupine Mountains forest in northern Michigan are typical examples. In both areas there are priceless remnants of virgin forest in imminent danger of destruction, and there are rare wildlife species which must have adequate sanctuary if they are to survive. The Service is aware, also, of the continuing deterioration of the values in some of its authorized projects, where no systematic program of national park land acquisition has been authorized. Likewise, little progress has been made in the vital matter of acquiring private inholdings in the established national parks and monuments. In the Joshua Tree National Monument, for instance, the private-land situation is such that it prevents the proper development of the monument for public use or the adequate protection of the plant species for which the area is named.

the War Department transferred the Andrew Johnson National Cemetery; and the Andrew Johnson Homestead was purchased, bringing together the essential properties for establishment of the monument.

Additions were made to 25 existing units through the purchase of 2,503 acres; the acquisition by donation of 4,285 acres; and the transfer of 28,608 acres already in Government ownership.

The Governor of Florida has evinced wholehearted interest in this projected park.

Coronado International Memorial, Arizona.—By act of August 18, 1941, the Congress authorized the establishment of a memorial in Arizona to commemorate the explorations of Francisco Vasquez de Coronado. An area of 2,880 acres of land adjoining the international boundary and located about 10 miles west of the town of Naco has been selected for this purpose. The act provides that a Presidential proclamation establishing the memorial shall be issued when the Government of Mexico has established, or provided for the establishment of, an adjoining area of similar type and size in the State of Sonora.

At a conference held in Mexico City in June attended by representatives of the United States Government and Arizona and of the Government of Mexico arrangements were made to survey the area proposed for the memorial in the State of Sonora so that a decree

can be issued by the President of Mexico establishing it as the Coronado International Memorial Park. The uses, functions, development, and administration of the Coronado International Memorial, comprising areas on each side of the international boundary, also were outlined at the conference. This international memorial, when established, will symbolize the unity existing between Mexico and the United States.

Cumberland Gap National Historical Park project, Kentucky, Tennessee, and Virginia, was authorized by act of June 11, 1940. A recent appropriation for land acquisition by the Kentucky Legislature of \$150,000 brought this project nearer realization. The State of Tennessee had previously appropriated \$75,000 with which to acquire its portion of the tri-State area. Virginia has completed its surveys and options with funds allocated for the purpose and has indicated that \$75,000 will be forthcoming with which to exercise the options.

Cape Hatteras National Seashore Recreational Area project, North Carolina, was authorized by act of August 17, 1937, and redesignated by the act of June 29, 1940. During the past year the Cape Hatteras Seashore Commission has been successful in securing more than 7,000 acres, mostly in lands belonging to the State and to Dare County, for conveyance to the Federal Government. At least 10,000 acres must be acquired before the area, which will include the existing Kill Devil Hill Memorial National Monument, Fort Raleigh National Historic Site, and Cape Hatteras Lighthouse, can be established.

Saratoga National Historical Park project, New York, was authorized by act of June 1, 1938. Title to most of the area was conveyed to the United States by the State of New York in 1941. Options have been obtained on more than one-half of the remaining lands which must be acquired before the park can be formally established.

Encouraging as are the foregoing gains, the Service realizes that effective means have not yet been found to save some unique areas that are worthy of preservation, the status of which is critical. The Tensas River forest in Madison Parish, La., and the Porcupine Mountains forest in northern Michigan are typical examples. In both areas there are priceless remnants of virgin forest in imminent danger of destruction, and there are rare wildlife species which must have adequate sanctuary if they are to survive. The Service is aware, also, of the continuing deterioration of the values in some of its authorized projects, where no systematic program of national park land acquisition has been authorized. Likewise, little progress has been made in the vital matter of acquiring private inholdings in the established national parks and monuments. In the Joshua Tree National Monument, for instance, the private-land situation is such that it prevents the proper development of the monument for public use or the adequate protection of the plant species for which the area is named.

Reappraisal of Objectives and Classification of Areas

World War II brought to a close a 9-year period of park development that was one of the outstanding phases of the peacetime conservation and employment programs. This finds the National Park Service with enlarged responsibilities and functions. The national park areas now number 166, contain almost 22,000,000 acres, and were visited during the past 5 years by an average of approximately 17 million people annually. To the 26 areas designated by the Congress as "national parks" there have been added other types—national monuments, historical parks, military parks, historic sites, parkways, and recreational areas. Under the CCC, the Historic Sites Survey, and the Park, Parkway, and Recreational Area Study, there has been a widespread program of cooperation with the States. This has of necessity called for more complicated organization, greater personnel, and new policies to meet varying situations and needs. The Service during the past year, therefore, has thought it appropriate to analyze its position, and to redefine and clarify its objectives in the light of changed conditions.

Many members of the Washington Office staff and representatives from the field have collaborated in preparing a statement of objectives. This takes into account the increased complexity of the Service's activities as a result of the emergency program, the added functions that by congressional and executive action it has been asked to assume, and the new types of areas that it has been called upon to administer.

Today, as in the early years, much of the Service's prestige and distinction lie in the fact that it is the Nation's trustee for certain outstanding historic shrines and superlative examples of Nature's handiwork in the United States. It was such areas that the Congress had in mind when the basic policy of administering national park lands was thus stated in the act of August 25, 1916: "To conserve the scenery and the natural and historic objects and the wildlife therein, and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

This, the foundation idea upon which the Service is built, is basic today. It provides the unifying element that welds all national park units into a system. Development and use of the areas must follow a pattern that will afford to visitors, without material impairment of the natural and historical characteristics, the deeply satisfying experience that each area is capable of giving.

The Service has also given considerable study to the question of terminology, with the hope that the present unwieldy classification of areas might be reduced and simplified to meet the requirements of common usage.

Officials Receive Pugsley Awards

The three Cornelius Amory Pugsley medals, awarded by the American Scenic and Historic Preservation Society each year for outstanding park achievements, were all given in the national field for 1941 rather than for National, State, and municipal work, as in the past.

The gold medal was awarded to Secretary of the Interior Harold L. Ickes for "Distinguished park service in the national field." Arthur E. Demaray, Associate Director of the National Park Service, was awarded the silver medal for his long and able service in the interest of the national parks; and Miss Harlean James, executive secretary of the American Planning and Civic Association, received the bronze medal for her years of devoted service in the interest of America's parks. Presentation of the medals was made in the office of the Secretary of the Interior on June 4, 1942.

Former Director Cammerer Honored

At the request of the National Park Service, approved by the Secretary of the Interior, the United States Board on Geographical Names authorized the naming of two natural features in Great Smoky Mountains National Park, Mount Cammerer and Cammerer Ridge, in recognition of the distinguished services of Arno B. Cammerer, Director of the National Park Service from 1933 to 1940, and an official of that agency from July 1919 until his death in April 1941 deprived the Service of one of its most valuable members. Mr. Cammerer had a large part in the establishment of Great Smoky Mountains National Park and other eastern national parks; he had guided the efforts of many thousands of employees and had borne the brunt of organizing many new and expanded activities of the Service between 1933 and 1940. Always, he zealously guarded the national parks against over-development in order to retain their significant natural and historic character.

Removal of Service's Washington Office to Chicago

On December 19, 1941, the Director of the Bureau of the Budget issued a directive providing for the removal of the Washington offices of the National Park Service, the Fish and Wildlife Service, and the

Reappraisal of Objectives and Classification of Areas

World War II brought to a close a 9-year period of park development that was one of the outstanding phases of the peacetime conservation and employment programs. This finds the National Service with enlarged responsibilities and functions. The national park areas now number 166, contain almost 22,000,000 acres, were visited during the past 5 years by an average of approximately 17 million people annually. To the 26 areas designated by the Congress as "national parks" there have been added other types: national monuments, historical parks, military parks, historical parkways, and recreational areas. Under the CCC, the Historic Survey, and the Park, Parkway, and Recreational Area Study, there has been a widespread program of cooperation with the States. There has of necessity called for more complicated organization, greater personnel, and new policies to meet varying situations and needs. The Service during the past year, therefore, has thought it appropriate to analyze its position, and to redefine and clarify its objectives in the light of changed conditions.

Many members of the Washington Office staff and representatives from the field have collaborated in preparing a statement of objectives. This takes into account the increased complexity of the Service's activities as a result of the emergency program, the added functions that by congressional and executive action it has been asked to assume, and the new types of areas that it has been called upon to administer.

Today, as in the early years, much of the Service's prestige and distinction lie in the fact that it is the Nation's trustee for certain outstanding historic shrines and superlative examples of National handiwork in the United States. It was such areas that the Congress had in mind when the basic policy of administering national park lands was thus stated in the act of August 25, 1916: "To serve the scenery and the natural and historic objects and the wildlife therein, and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

This, the foundation idea upon which the Service is built, is basic today. It provides the unifying element that welds all national park units into a system. Development and use of the areas must follow a pattern that will afford to visitors, without material impairment of the natural and historical characteristics, the deeply satisfying experience that each area is capable of giving.

The Service has also given considerable study to the question of terminology, with the hope that the present unwieldy classification of areas might be reduced and simplified to meet the requirements of common usage.

Officials Receive Pugsley Awards

The three Cornelius Amory Pugsley medals, awarded by the American Scenic and Historic Preservation Society each year for outstanding park achievements, were all given in the national field for 1941 rather than for National, State, and municipal work, as in the past.

The gold medal was awarded to Secretary of the Interior Harold L. Ickes for "Distinguished park service in the national field." Arthur E. Demaray, Associate Director of the National Park Service, was awarded the silver medal for his long and able service in the interest of the national parks; and Miss Harlean James, executive secretary of the American Planning and Civic Association, received the bronze medal for her years of devoted service in the interest of America's parks. Presentation of the medals was made in the office of the Secretary of the Interior on June 4, 1942.

Former Director Cammerer Honored

At the request of the National Park Service, approved by the Secretary of the Interior, the United States Board on Geographical Names authorized the naming of two natural features in Great Smoky Mountains National Park, Mount Cammerer and Cammerer Ridge, in recognition of the distinguished services of Arno B. Cammerer, Director of the National Park Service from 1933 to 1940, and an official of that agency from July 1919 until his death in April 1941 deprived the Service of one of its most valuable members. Mr. Cammerer had a large part in the establishment of Great Smoky Mountains National Park and other eastern national parks; he had guided the efforts of many thousands of employees and had borne the brunt of organizing many new and expanded activities of the Service between 1933 and 1940. Always, he zealously guarded the national parks against over-development in order to retain their significant natural and historic character.

Removal of Service's Washington Office to Chicago

On December 19, 1941, the Director of the Bureau of the Budget issued a directive providing for the removal of the Washington offices of the National Park Service, the Fish and Wildlife Service, and the

Office of Indian Affairs, Department of the Interior, to Chicago, Ill., as a part of a program to make additional office and housing space available for the rapidly expanding war agencies. At the close of the fiscal year, the Office of Decentralization Service, Public Buildings Administration, had completed negotiations for the rental of space for the central offices of those agencies in Chicago's Merchandise Mart Building. A small liaison office will remain in Washington to handle matters affecting the National Capital Parks, the District of Columbia Zoning Commission, and the National Capital Park and Planning Commission, and to carry out special assignments for the Director.

Personnel Changes

The war has brought far-reaching changes in the personnel of the National Park Service. The reductions in the CCC throughout the year and its elimination on June 30, 1942, reduced the working organization substantially. Curtailment of appropriations brought further reductions. The move to Chicago made it necessary for many employees to transfer to other agencies.

Over 300 Service employees, regular and CCC, have joined the armed forces, and more than 150 have transferred to agencies primarily engaged in war work.

The Service is proud of those who are making such a worthy contribution to our Nation by joining the ranks of her defenders and of the many who have sought arduous and technical assignments in war production work. We are also proud of the way in which added burdens have been assumed by the existing staff because of the many transfers and reductions in personnel.

Throughout the National Park Service our wartime pledge is to protect for this and future generations the outstanding examples of the American scene entrusted to us, and to administer each area so as to maintain integrity of the purpose for which it was established. We are strengthened in this resolution by your statement that "A Nation like ours at war is inspired to greater efforts by the thought that institutions in which it takes pride, and which symbolize its greatness, are being defended and will exist after the war has been won."

Statistical Tables

This year, with the annual report reduced in length to economize on paper and to relieve the burden on printing facilities, only one table giving the areas administered by the National Park Service, the acreage in each and the visitation is included. Other statistics on the operations of the National Park Service have been compiled for administrative purposes and copies may be obtained from the Director, National Park Service, Chicago, Ill.

Fish and Wildlife Service

IRA N. GABRIELSON, Director

Custody of Wildlife and Fishery Resources in Wartime

THE second year of the Fish and Wildlife Service¹ was one of the most difficult in a history that through parent agencies extends well back into the nineteenth century. Still engaged at the year's opening in the task of organizing and coordinating the work of a new governmental unit, the Service had at the same time to face the adjustments required by the national defense program, adjustments that became all the more difficult in the middle of the year when war itself came to the Nation. Soon thereafter the Service was confronted with the task of preparing for the transfer of its headquarters to Chicago, Ill., and finally to the perplexities of these problems were added those of retrenchment in accordance with reduced appropriations for the next year.

Nevertheless, it is possible to report considerable success in wildlife and fishery conservation programs, and it is encouraging to realize that a series of progressive years had placed the resources in good condition to face the hazards that come to peacetime pursuits in time of war. Though thus encouraged, the Service and conservationists throughout the country were engaged in the grim task of conversion to war. Camps of the Civilian Conservation Corps, for example, which had provided labor for developing national wildlife refuges, were reduced from 36 to 12. Of the remaining camps, 4 were working on military areas, and arrangements were being completed for thus using the other 8, when, at the close of the year, action of Congress abolished the CCC. Other aspects of the Service's work, on the other hand, received increased emphasis.

Fishery Management

The fisheries of the Nation assumed immediately an outstanding importance as a source of vital food. The facilities of the Service

¹ This Service was formed on June 30, 1940, by consolidating the Bureau of Biological Survey and the Bureau of Fisheries in accordance with the President's Reorganization Plan No. III.

for making the fishery contributions most effective were mobilized and made available to the armed forces, the lend-lease agencies, and the industry. By the end of the year plans were well formulated for the program that began later with the appointment of the Secretary of the Interior as Fishery Coordinator and the Director of this Service as Deputy Coordinator.

The fishery contributions of food and essential byproducts, it was realized, are so great that without them the ability of the Nation to wage war would be lessened materially. Increasing demands for canned food led to an adjustment of regulations in Alaska whereby the fisheries may produce the maximum yield consistent with maintaining a future supply. Adoption of scientifically developed management measures by the States are allowing more fishes to grow to marketable size and to spawn, thus resulting in greater yields. Farming methods were advocated for restoring depleted oyster beds, and procedures of scientific oyster culture are improving the quality of the edible product. Although the "popular" fishes, including haddock, cod, shad, and salmon, are being harvested to capacity, the fishermen are being urged to concentrate on the landing of minor and less familiar species, with the result that many tons of food and byproducts are being derived from hitherto underutilized species. There are possibilities of further increases from this source, not only in the sea but even in the Great Lakes and the larger rivers. Additional sources of vitamin-potent fish oils are being sought to supplement present supplies, and possibilities for developing new products have been disclosed. The development of farm ponds in the Southern States is spreading rapidly under scientific guidance, and the adoption of improved methods of pondfish culture and pond fertilization and management is producing fishery resources of great aggregate magnitude in areas where fresh fish hitherto has been a luxury food. Not only are scientific investigation and development of methods for controlling industrial pollution saving tons of valuable fishes in inland and coastal waters, but control methods are resulting in the recovery of quantities of strategic material from the wastes.

Statistical compilations, too, were made as an essential labor of the Service. As vital in conservation of fisheries as other natural resources, these summaries stand as guides for Service activities and as aids in informing other Federal agencies and the public. Data collected for 1940 (the latest year for which complete figures are available) show, for example, that nearly 125,000 fishermen, employed that year in the catch of 4,059,524,000 pounds of fishery products, in waters of the United States and Alaska, profited to the extent of almost \$100,000,000—a 2-percent gain in value over the preceding year despite a 9-percent recession in volume. A total of about \$238,000,000 was estimated as the value of this harvest to domestic

fish handlers and processors (in whose plants worked an additional 90,000 men) as prepared for market in 1940.

collecting, compiling, analyzing, and issuing current data on the production, distribution, and marketing of all fishery products provided information of paramount importance in any Federal program incorporating food control, information of great value to the Office of War Relocation Administration, and also to the fishing industry. Investigations in canning and curing fishery products made available information on up-to-date methods in food preservation and indicated what processes are most suitable for canning or curing when increased supplies are demanded as a food-conservation measure. Other activities included examining samples of canned fish for quality; assisting military procurement officials to draw up purchasing specifications for fish and advising with them in their purchase of these products; working out methods of canning or curing species of fishes not now utilized; and advising on the practicability of proposed new canning ventures to increase the national food supply for emergency use.

At the request of a committee that included representatives of the United Nations, the Service's laboratories expanded their vitamin-A programs to include a survey of potential sources. In allied interest, liver and viscera samples were collected from many species of fishes and studied for A and other vitamin-oil content, concentrates, and most efficient methods of recovery. Other studies involved a factual survey on vitamin-D oils, the development of more rapid methods of drying fish for domestic use or shipment to our expeditionary forces and to the peoples of the United Nations, and finding a substitute for the agar-agar used in bacteriological media in many industrial and drug-manufacturing plants and by hospital and public-health services.

The purchasing of large quantities of canned fishery products for use by expeditionary forces and for export under the lend-lease program were seen as definite limiting factors on the quantity of canned fish available for domestic consumption. To counteract this effect, a detailed study was made relative to preservation of fishery products, a study that may enable the fishery resources of Alaska to supplement the domestic supply with minimum requirements for shipping space. Attention was also given to the rapidly growing importance of cold-storage locker plants, some 3,500 of which are available in this country and can be used in substituting frozen for canned fish. Fish producers, distributors, and locker-plant operators were acquainted with the manner in which channels of distribution can be established for utilizing this equipment. Close to half a million tons of fresh and frozen fishery products have been annually packaged in tin, including salmon, haddock, sardines, tuna, mackerel, crab meat, shrimps, clams, and oysters. With the tin supply as it is, the Service has engaged in experimental

and research work on substitute metals, on determining the fish that can be best marketed in forms other than canned, and standardization of the can sizes used for sea foods.

Specialists of the Service collaborated with the Navy Department and the Maritime Commission to maintain a proper balance between the number of vessels in each fishery taken for military use and retained for food production, and with the Agricultural Marketing Administration to enable that agency most efficiently to process fishery commodities for lend-lease use. One expert visited Japan on a detail relative to fishery matters for the Office of Lend-Lease Administration, pausing en route in England to make a rapid survey of distribution of lend-lease fishery products there.

In cooperation with the Coordinator of Inter-American Affairs, the Department of State, a survey of the fisheries of the Caribbean Sea was undertaken. Not only does this work promise of leading to the discovery of new fisheries and consequently new supplies of food, vitamin oils, and industrial materials to be developed locally and perhaps tapped by our own men, but it has also, it is hoped, advanced our good neighborly relations.

For the Office of Price Administration, War Production Administration, Public Health Service, War, Navy, and State Departments, War Relocation Administration, American Development Commission, and other Federal agencies, additional studies are being made, or the services rendered by specialists levied upon, to appraise species of fishes that can be taken in quantities for lend-lease or military use; to determine the methods of capture of various species in order that net-manufacturing may be more efficiently utilized for making camouflage nets; to prepare price data for determining ceilings on fishery products; to study the needs of the fishery industry for war-risk insurance; to advise the position fishery products should take in the stock of sea foods to be stored in Puerto Rico and Alaska in the event of emergency transportation; and to compile statistics on the production of sea foods in waters of various countries in the theatres of combat. Finally, at the request of the Board of Economic Warfare, may enable military to find local fish supplies abroad for our expeditionary forces and so allow more space for arms in ships. So, also, more men are left at home for domestic consumption.

The Service continued its protection of the fisheries of Alaska, yielding products having an average annual value of more than \$45,000,000, about nine-tenths of which is in canned salmon. Increased intensity of fishing is considered inevitable under war conditions, and greater vigilance has thus been deemed necessary on the part of the law-enforcement officers and biological investigators to prevent impairment of future fishery harvests through inadequate spawning.

The production of fish and eggs at the Federal fish hatcheries was maintained at approximately the same level as in the preceding year. The necessity for more economical operations compelled a revision of the program with the object of closing some of the hatcheries as well as deferring all new hatchery developments or expansion of existing units. Likewise distribution and planting practices were modified to meet new conditions. Attention was given to stocking farm ponds for the production of food, and to planting game fishes in more accessible waters so that urban populations may enjoy angling recreation with a minimum of travel.

Wartime Wildlife Management

Control of predators and rodents that are limiting factors on food production also took on increasing importance when war began. Livestock, poultry, and agricultural industries were protected by the elimination of 123,667 predatory animals, by controlling injurious insects on 20,966,606 acres of infested farm and range lands, and by destroying rats in town and country, thereby saving large quantities of the Nation's wool, fats, lanolin, food and feed resources for military and civilian needs and preventing the spread of animal-borne diseases transmissible to man and domestic livestock.

Furs became a concern of the armed forces facing the task of waging war in cold climates, and the Service rendered assistance illustrated by the appointment of its outstanding fur expert as a specialized consultant of the Cold Climate Clothing Section of the Quartermaster Corps. The Navy Department called upon the Service through its Division of Land Acquisition to appraise lands for war purposes in the State of Washington, and later requests for land appraisals and cadastral surveys in many parts of the United States so increased that at the close of the year the entire field staff of this division was engaged in appraising and surveying lands for the Navy Department. Its Washington staff was also engaged for the most part in preparing reports and maps submitted from the field on the areas appraised and surveyed.

In other ways also the Service applied its activities to the fighting needs of the Nation.

Projects not directly related to the war were drastically curtailed, but without discontinuing conservation programs that must not be abandoned. The extensive habitat-improvement and other development work accomplished during recent years on national wildlife refuge lands, for example, together with the excellent water conditions prevailing on most of the refuges last spring, demonstrated the value of these refuges in this period of national emergency in greatly increased wildlife production. All forms of wildlife occurred on the

refuges in greater numbers than ever before. Fur animals went to a point where they made a substantial contribution to the providing furs for outfitting troops for military duty in the climates. Wherever feasible without adverse effect on the grazing by domestic livestock, hay harvesting, agricultural production, and other economic uses of refuge lands were permitted thus making many thousand acres available for the production of food. Almost 1,000,000 acres of national wildlife-refuge lands were turned over to the War and Navy Departments for military purposes.

In wartime as well as in peace the Nation's natural resources must be safeguarded, and the Fish and Wildlife Service is one of the agencies upon which the responsibility rests to see that no adverse damage is suffered on the home front. Its efforts have therefore been exerted to make every possible contribution to the war but at the same time to provide security for the fish and wildlife resources during the struggle and for the peace to come—through every means and every effort that cannot be exerted directly in fighting.

Throughout the year the Service has been conscious of the importance of outdoor recreation to the citizens of a nation under the stress of war, and it has done everything possible to continue its efforts on behalf of those resources that are important to sportsmen and others who seek relaxation in the outdoors. Despite the devotion to war activities, increased numbers of persons sought recreation and relaxation by hunting waterfowl. This was indicated by the sale of nearly 1,400,000 migratory-bird hunting stamps, compared with 1,260,810 sold last year. Enforcement of the Federal laws and regulations protecting wildlife continued effective, and excellent cooperation in this work was given by an appreciative public and the game departments.

Importance of Fish and Wildlife Research

All the year's activities again emphasized the importance of the Service's fact-finding projects—fish and wildlife research, including field and laboratory investigations and experiments and the collection and compilation of statistical data. Wartime shortages of materials used in rodent control required intensification of studies of substitutes available from domestic sources. Plans for the best utilization of food resources were dependent on reliable data, and the development of new areas from which fishes can be taken required exploration. Such regulatory work as that of setting seasons for the hunting of migratory birds, as in the past, seemed feasible only with the knowledge based on year-round investigations—studies that during the past year indicated the desirability of relaxing restrictions and which, of course, demonstrated the success of the restoration program.

The research and conservation policies of the Department in management of the national migratory game-bird resources have, in fact, been fully justified by consistent increases under a sound utilization program during recent years. A survey inventory of big-game animals showed improvement in the status of this important food and recreational resource. Development of new methods for the control of destructive predatory animals, rodents, and birds assumed greatly increased importance in the war requirements for meat, cereals, fruits, and other food products because of the cutting off of supplies required for the preparation of standard materials heretofore used. Intensive work was concentrated on this requirement with promising results. Work on fur and fur fibers was directed vigorously to meet warm-clothing requirements of military and civilian agencies through new and improved manufacturing methods in utilizing pelts, fur, hairs, and waste materials. Increased fur-animal production was aided by presenting improved feeding and breeding practices and methods for the prevention and control of diseases. Thus despite demands for discontinuing many research projects during the war, it was the duty of the Service to emphasize the basic importance of continuing its scientific investigations.

Keeping the Public Informed

Though necessarily reduced, activities were continued to keep the public and particularly conservationists informed regarding the needs in safeguarding the fish and wildlife resources. With a curtailment of programs not directly related to the war, it was realized that prevention of raids on the resources under false pretexts become more important than before and require a vigilance on the part of conservationists that can be maintained only through adequate information programs. One of the most promising developments in the field of wildlife conservation in recent years has been the organization and growth of the Outdoor Writers Association of America and the increase of outdoor columns in the daily press, supplementing the contributions of outdoor periodicals and other agencies to conservation education. Thus, for the sake of maintaining conservation vigilance and also of meeting the needs of those who serve the information requirements of the public, it seemed essential to maintain the Service's basic responsibility for disseminating information though the output was drastically curtailed.

In one sense such publicity on the outdoors has seemed to be a distinct contribution to the Nation at war, for men and women whose time in the outdoors is limited, whose access to the tonic benefits of recreation in the open is cut off, may get some of their needed relaxation in reading, or in hearing radio broadcasts that bring the outdoors

indoors. Such news items and broadcasts may also in some measure encourage outdoor interests among the general public, and it seems apparent that, like the British people, the Americans will find themselves in need of such relief from the stresses and strains of carrying on a difficult war.

In another sense, conservation publicity serves a national need in preventing the spread of ideas whose folly can be revealed to the public merely by a word of caution. Considerable display was given by the American press, for example, to a London report that "sparrows, starlings, crows, larks, curlews, and even swans are helping to feed Britain at war." Fortunately this publicity was followed promptly by this Service's widely read comment that, although wildlife has emergency food values, Americans will make a grave mistake if they try at present to include song and game birds in their wartime larder. It has been demonstrated that the song birds will make a much better contribution to the food-for-freedom cause by making war on the insect pests of crops. Even game, which becomes a part of the Nation's food supply and is estimated to replace annually enough meat to feed an army of 5,000,000 for 77 days, affords recreation that Americans consider even more important than the meat obtained from its pursuit. Yet the general public cannot be constantly aware of these relationships; it must be kept informed.

Americans have been waging an uphill, though successful, fight to restore their wildlife populations after disastrous exploitation. Game laws have been as liberal as the game could stand. Better management can increase the surpluses, and even at present there is in some areas a surplus of deer, elk and other animals that might be more wisely used to the Nation's wartime advantage. Yet selfish interests may—without discrimination—be ready to use war conditions as a pretext for making disastrous inroads on this resource. If it ever becomes necessary, Americans can fall back on their wildlife meat supply, although it would not last long. Anyone advocating this at present, however, except for species that are locally overabundant, is either misguided or else is thinking more about his own privileges than about the needs of the Nation. A most effective way to combat the wartime spread of such proposals is through making the facts and actual relationships known.

No Time to Forget Conservation Principles

This is no time to forget conservation principles, and, though energies must now be applied fully to the task of winning the war, this should be done without losing sight of the peace conditions for which the fight is waged. Those who by force of circumstances are not on the actual fighting front have an increased responsibility—

they should be doubly alert to see that the needs of conservation are not forgotten when the materials and revenues of the Nation are so urgently needed for war that conservation programs must be curtailed. We should realize that information media are now feasible and most useful instruments for conservation. As shown by the experience of the past year, they are also instruments that can be used with comparatively little expenditure of time and effort. Drastic reductions were in fact made in the small personnel specializing in information work, and other employees carried on such work incidental to their specialized duties.

During National Wildlife Week, for example, Service members throughout the country made 56 broadcasts of a radio program called *Wildlife and the American Way of Living* and placed news items on the week's significance in 180 newspapers in 40 States. Officials of the Service, in connection with their attendance at conventions and meetings, presented addresses and, in response to requests, described the wildlife situation in articles for periodicals. Among the latter was an extensive discussion in an article for *Audubon Magazine* by the Director with the title *No Time To Forget Conservation*. As a result of these incidental, though deliberate, efforts it is believed that the American public and particularly the organized conservationists were kept informed and alert and that the hazards to conservation of a neglectful public were minimized.

So far as expenditure of time, effort, and money was involved, it should be emphasized again that the Service's distinctive concerns of the year were primarily those related to its part in the Nation's war program.

Fishery Biological Investigations

Fish for war is the present aim of the fishery biological investigations of the Service. Procuring a maximum yield of food from the fisheries, a food particularly adapted to wartime needs, depends upon management of the fish supply and the rate and method of harvesting. Without management, overfishing of the most important and valuable food fishes will continue. Thus production in subsequent years will be curtailed when ample food supplies will be even more essential. On the other hand if management is applied this year and the fishing rate is adjusted to the annual rate of replacement of the fish stocks, greater yields will be obtained during each succeeding year with fewer vessels and at smaller cost, the fisheries will be brought to maximum production, and conservation of the future supply will be assured.

Principles of management, however, cannot be determined deductively or applied arbitrarily. Research is required to disclose, year by year and for each important species of aquatic food animal, varia-

indoors. Such news items and broadcasts may also in some measure encourage outdoor interests among the general public, and it seems apparent that, like the British people, the Americans will find themselves in need of such relief from the stresses and strains of carrying on a difficult war.

In another sense, conservation publicity serves a national need in preventing the spread of ideas whose folly can be revealed to the public merely by a word of caution. Considerable display was given by the American press, for example, to a London report that "sparrows, starlings, crows, larks, curlews, and even swans are helping to feed Britain at war." Fortunately this publicity was followed promptly by this Service's widely read comment that, although wildlife has emergency food values, Americans will make a grave mistake if they try at present to include song and game birds in their wartime larder. It has been demonstrated that the song birds will make a much better contribution to the food-for-freedom cause by making war on the insect pests of crops. Even game, which becomes a part of the Nation's food supply and is estimated to replace annually enough meat to feed an army of 5,000,000 for 77 days, affords recreation that Americans consider even more important than the meat obtained from its pursuit. Yet the general public cannot be constantly aware of these relationships; it must be kept informed.

Americans have been waging an uphill, though successful, fight to restore their wildlife populations after disastrous exploitation. Game laws have been as liberal as the game could stand. Better management can increase the surpluses, and even at present there is in some areas a surplus of deer, elk and other animals that might be more wisely used to the Nation's wartime advantage. Yet selfish interests may—without discrimination—be ready to use war conditions as a pretext for making disastrous inroads on this resource. If it ever becomes necessary, Americans can fall back on their wildlife meat supply, although it would not last long. Anyone advocating this at present, however, except for species that are locally overabundant, is either misguided or else is thinking more about his own privileges than about the needs of the Nation. A most effective way to combat the wartime spread of such proposals is through making the facts and actual relationships known.

No Time to Forget Conservation Principles

This is no time to forget conservation principles, and, though energies must now be applied fully to the task of winning the war, this should be done without losing sight of the peace conditions for which the fight is waged. Those who by force of circumstances are not on the actual fighting front have an increased responsibility—

they should be doubly alert to see that the needs of conservation are not forgotten when the materials and revenues of the Nation are so urgently needed for war that conservation programs must be curtailed. We should realize that information media are now feasible and most useful instruments for conservation. As shown by the experience of the past year, they are also instruments that can be used with comparatively little expenditure of time and effort. Drastic reductions were in fact made in the small personnel specializing in information work, and other employees carried on such work incidental to their specialized duties.

During National Wildlife Week, for example, Service members throughout the country made 56 broadcasts of a radio program called *Wildlife and the American Way of Living* and placed news items on the week's significance in 180 newspapers in 40 States. Officials of the Service, in connection with their attendance at conventions and meetings, presented addresses and, in response to requests, described the wildlife situation in articles for periodicals. Among the latter was an extensive discussion in an article for *Audubon Magazine* by the Director with the title *No Time To Forget Conservation*. As a result of these incidental, though deliberate, efforts it is believed that the American public and particularly the organized conservationists were kept informed and alert and that the hazards to conservation of a neglectful public were minimized.

So far as expenditure of time, effort, and money was involved, it should be emphasized again that the Service's distinctive concerns of the year were primarily those related to its part in the Nation's war program.

Fishery Biological Investigations

Fish for war is the present aim of the fishery biological investigations of the Service. Procuring a maximum yield of food from the fisheries, a food particularly adapted to wartime needs, depends upon management of the fish supply and the rate and method of harvesting. Without management, overfishing of the most important and valuable food fishes will continue. Thus production in subsequent years will be curtailed when ample food supplies will be even more essential. On the other hand if management is applied this year and the fishing rate is adjusted to the annual rate of replacement of the fish stocks, greater yields will be obtained during each succeeding year with fewer vessels and at smaller cost, the fisheries will be brought to maximum production, and conservation of the future supply will be assured.

Principles of management, however, cannot be determined deductively or applied arbitrarily. Research is required to disclose, year by year and for each important species of aquatic food animal, varia-

indoors. Such news items and broadcasts may also in some measure encourage outdoor interests among the general public, and it seems apparent that, like the British people, the Americans will find themselves in need of such relief from the stresses and strains of carrying on a difficult war.

In another sense, conservation publicity serves a national need in preventing the spread of ideas whose folly can be revealed to the public merely by a word of caution. Considerable display was given by the American press, for example, to a London report that "sparrows, starlings, crows, larks, curlews, and even swans are helping to feed Britain at war." Fortunately this publicity was followed promptly by this Service's widely read comment that, although wildlife has emergency food values, Americans will make a grave mistake if they try at present to include song and game birds in their wartime larder. It has been demonstrated that the song birds will make a much better contribution to the food-for-freedom cause by making war on the insect pests of crops. Even game, which becomes a part of the Nation's food supply and is estimated to replace annually enough meat to feed an army of 5,000,000 for 77 days, affords recreation that Americans consider even more important than the meat obtained from its pursuit. Yet the general public cannot be constantly aware of these relationships; it must be kept informed.

Americans have been waging an uphill, though successful, fight to restore their wildlife populations after disastrous exploitation. Game laws have been as liberal as the game could stand. Better management can increase the surpluses, and even at present there is in some areas a surplus of deer, elk and other animals that might be more wisely used to the Nation's wartime advantage. Yet selfish interests may—without discrimination—be ready to use war conditions as a pretext for making disastrous inroads on this resource. If it ever becomes necessary, Americans can fall back on their wildlife meat supply, although it would not last long. Anyone advocating this at present, however, except for species that are locally overabundant, is either misguided or else is thinking more about his own privileges than about the needs of the Nation. A most effective way to combat the wartime spread of such proposals is through making the facts and actual relationships known.

No Time to Forget Conservation Principles

This is no time to forget conservation principles, and, though energies must now be applied fully to the task of winning the war, this should be done without losing sight of the peace conditions for which the fight is waged. Those who by force of circumstances are not on the actual fighting front have an increased responsibility—

they should be doubly alert to see that the needs of conservation are not forgotten when the materials and revenues of the Nation are so urgently needed for war that conservation programs must be curtailed. We should realize that information media are now feasible and most useful instruments for conservation. As shown by the experience of the past year, they are also instruments that can be used with comparatively little expenditure of time and effort. Drastic reductions were in fact made in the small personnel specializing in information work, and other employees carried on such work incidental to their specialized duties.

During National Wildlife Week, for example, Service members throughout the country made 56 broadcasts of a radio program called *Wildlife and the American Way of Living* and placed news items on the week's significance in 180 newspapers in 40 States. Officials of the Service, in connection with their attendance at conventions and meetings, presented addresses and, in response to requests, described the wildlife situation in articles for periodicals. Among the latter was an extensive discussion in an article for *Audubon Magazine* by the Director with the title *No Time To Forget Conservation*. As a result of these incidental, though deliberate, efforts it is believed that the American public and particularly the organized conservationists were kept informed and alert and that the hazards to conservation of a neglectful public were minimized.

So far as expenditure of time, effort, and money was involved, it should be emphasized again that the Service's distinctive concerns of the year were primarily those related to its part in the Nation's war program.

Fishery Biological Investigations

Fish for war is the present aim of the fishery biological investigations of the Service. Procuring a maximum yield of food from the fisheries, a food particularly adapted to wartime needs, depends upon management of the fish supply and the rate and method of harvesting. Without management, overfishing of the most important and valuable food fishes will continue. As a result of these incidental, though deliberate, efforts it is believed that the American public and particularly the organized conservationists were kept informed and alert and that the hazards to conservation of a neglectful public were minimized.

So far as expenditure of time, effort, and money was involved, it should be emphasized again that the Service's distinctive concerns of the year were primarily those related to its part in the Nation's war program.

Fishery Biological Investigations

Fish for war is the present aim of the fishery biological investigations of the Service. Procuring a maximum yield of food from the fisheries, a food particularly adapted to wartime needs, depends upon management of the fish supply and the rate and method of harvesting. Without management, overfishing of the most important and valuable food fishes will continue. Thus production in subsequent years will be curtailed when ample food supplies will be even more essential. On the other hand if management is applied this year and the fishing rate is adjusted to the annual rate of replacement of the fish stocks, greater yields will be obtained during each succeeding year with fewer vessels and at smaller cost, the fisheries will be brought to maximum production, and conservation of the future supply will be assured.

Principles of management, however, cannot be determined deductively or applied arbitrarily. Research is required to disclose, year by year and for each important species of aquatic food animal, varia-

tions in the rate of reproduction, in the total fish populations or standing crops, and in the rate of fishing or withdrawal. The measurement of these variables involves also a relatively complete knowledge of the life histories, migrations, and ecological relations of the food fishes and of both the organisms on which they depend for food and those that prey upon them. Important, too, but in more limited spheres, especially in relation to oysters, clams, trouts, salmon, and certain pondfishes, are the perfecting of methods for artificial culture, farming, nutrition, and control of diseases, predators, and parasites—all vital activities in conserving existing stocks, restoring depleted populations, and creating new supplies. By the conservation of fishery resources on these principles, man is permitted to harvest and use the products of the waters to the fullest extent consistent with their perpetuation.

Commercial Fishery Management and Conservation

The annual fulfillment of the congressional mandate of February 9, 1871, to determine "whether any and what diminution in the number of the food fishes of the coasts and lakes of the United States has taken place" and "whether any and what protective, prohibitory, or precautionary measures should be adopted" demands more than simple statistical recapitulation. To meet the need, fishery biology, an exact science, has been developed by synthesizing the disciplines of biology, physics, chemistry, mathematics, economics, and logic. A brief résumé will illustrate the progress made in commercial fishery studies; recount new findings about the fisheries and the animals that support them; and tell of their use in developing conservation principles and management practices, of the recommendations adopted to insure the production of more fish of better quality, and of the restoration of depleted fisheries.

The possibilities for better coordination of fishery activities and for eventual attainment of the objective of uniform management are inherent in the ratification by the Congress on May 4, 1942, of the Atlantic Coast Marine Fisheries Compact, signed by nine States, under which the Service has been designated as the chief investigative and advisory agency.

The Service's only opportunity for direct application of findings in fishery biological research is in the management of the Alaskan fisheries, where the advantages of the flexible modern method as opposed to the traditional system of regulation by specific rigid legislation has been demonstrated.

The Fishery Mission to Mexico was continued and has made considerable progress in studies of the commercial fishery resources and

the development of sound management measures. Surveys and stocking of interior waters were also undertaken in cooperation with Mexican Government.

North Atlantic Area

Following the warning issued by the Service a year ago that the continued capture and sale of baby haddock would result in great financial loss and ruin the fishery, the industry voluntarily curtailed landings of baby haddock to only about 13 percent of the quantity landed during the previous year. Recommendations for increasing minimum size limit for haddock from 1½ to 2 pounds and enlarging mesh in trawls to release small fish, though not yet adopted, will materially increase the supply of large haddock.

Flounder catches showed marked improvement, owing to increased landings of yellowtails. This species dominated the catches, whereas a few years ago it was of only minor importance. The greater yield is out the Service's forecast that more fish could be produced by greater concentration on species not widely known or advertised. The black flounder had declined in yield and abundance, and current studies indicate the probable ineffectiveness of artificial propagation in maintaining the supply.

Since codfish were landed in greater quantities than ever before, the catches having risen from an insignificant figure in 1933 to 145,000,000 pounds. This unprecedented catch, an increase of 70 percent over 1933, has caused concern over the future of the fishery. Preliminary findings indicate the possible existence of more than one stock supporting the fishery and emphasize the need for control.

The reduced abundance of lobsters during recent years, about one-third of former high levels, indicates a need for better management. In Maine 96 percent of those marketed had never spawned. A higher minimum size limit, 3½ inches carapace measurement, instead of 3⅞ inches was recommended and already has been adopted in Maine, Massachusetts, and New York. Canada also followed the recommendation in parts of Nova Scotia and New Brunswick. The tagging experiments indicate that lobsters move only short distances, repopulation of depleted areas can be accomplished only by increased spawning and not by migration from other areas.

Atlantic salmon restoration was begun in Maine through the conclusion of a cooperative agreement between the Service and State conservation agencies, and the generous aid of the Canadian Government, which provided eggs for restocking.

Measurement of changes in mackerel abundance is an important problem, for the supply varies from year to year by as much as 20-450 percent, with corresponding variations in the total yield.

There seems to be no present danger of depleting the supply. Observations are being continued to trace trends of abundance and to stabilizing the fishery at a more productive and profitable level.

Middle Atlantic Area

The 1940-41 blue crab fishery production of Chesapeake Bay was about 50 percent less than in 1939, due chiefly to lack of an adequate spawning reserve, although unusually cold weather in January was presumed to have killed large numbers of crabs, especially females. Recommendations made for restoration included establishment of sanctuaries closed to crabbing from May 1 to September 1; enforcement of all size limits specified by Virginia and Maryland laws; discontinuing the holding of green crabs in seine floats; and adequate collection of catch statistics.

The Atlantic coast shad, except in the Hudson River, has been seriously overfished for years, the total food yield has been reduced, and shad fishermen are suffering economic distress. Based on experience in Chesapeake Bay and in North Carolina and South Carolina, the Service recommended a reduced rate of fishing as this would permit a recovery of shad populations comparable with that in the Hudson River where the fishing rate has permitted survival of sufficient spawning fish to bring the yield to the highest level in history. Maryland has adopted regulations that embody this recommendation of the Service.

South Atlantic and Gulf Areas

The spawning population of the common shrimp from Georgia to North Carolina, badly reduced by adverse weather in 1940, is being restored slowly, and normal fishing can be expected within a year or two. During this period of scarcity, the grooved shrimp occurred in unusual abundance, especially off North Carolina and Georgia. Research has been directed toward perfection of methods to determine the abundance of shrimp off the Texas coast, and toward correlation of abundance with climatological changes and assessing the effect of current fishing practices.

During recent years the crab fishery of Louisiana and the shrimp fishery of Texas have been so intensified that indications of depletion have become evident.

Pacific Area

Investigations of the Alaska salmon and herring fisheries produced data on the populations and runs of the various regions, which were used as a basis for regulations issued by the Secretary. Recommendations for management of the fisheries were prepared and

rd for the need of additional canned products and for insuring insurance of substantial future supplies.

udies were undertaken at the recently established laboratory at the Port Walter, Alaska, the results of which will place regulation on the great pink salmon fishery of southeastern Alaska on a firmer basis. By means of a two-way counting weir, the number of fry returning to the ocean from each year's spawning is determined. In this way the size of the next commercial run can be estimated with considerable accuracy and the fishing regulations adjusted to permit maximum safe catch.

The greatly increased demands for canned fishery products, as well as for meal and oil, have stressed the importance of the pilchard fishery. A serious feature is that the catch continued to be composed predominantly of small fish, even in waters north of California, where herring they had been much less numerous. Fishing intensity since 1913 increased fourfold over that from 1925 to 1933. Total mortality increased concurrently from 40 to 80 percent per annum, a near maximum rate of exploitation.

The shark fisheries, stimulated by wartime demands for vitamin B₁₂ and by its high concentration in certain shark-liver oils, especially those of the soupfin shark, developed so rapidly as to suggest that the catch may be too high in relation to the available supply and depletion may be imminent. In the interest of economy, it has been urged that carcasses be landed to provide for the utilization of additional materials that are lost when only the livers are removed at sea and carcasses discarded.

Great Lakes Area

The Lake Huron whitefish will soon be added to the list of species that no longer support fisheries, a fact emphasizing the need for immediate action to control adverse conditions if these fisheries are to be preserved. In 1931 the catch of these whitefish was 4,140,000 pounds, but it has declined continuously ever since; in 1939 it was 5,000 pounds; in 1940, 188,000 pounds; and in 1941, 114,000 pounds, only 2.8 percent of the 1931 catch. Destruction of the fishery is eminent, owing to the introduction of the deep trap net in 1928 and its multiplied use during later years. Prompt control of this highly destructive gear at the outset would have saved the fishery, but warnings of the Service were not heeded until the damage was done. The International Board of Inquiry for the Great Lakes Fisheries, established by Canada and the United States on February 29, 1940, has completed its work, and it may be forecast with certainty that the final report will recommend some form of unified control and scientific management of the fisheries to replace the present divided jurisdiction among nine regulatory bodies.

Shellfishery Investigations

In investigations directed toward the solution of practical problems concerned with the cultivation of oysters and other mollusk culture and management of oyster bottoms, improvement in the quality of the product, protection against enemies and pollution, and measures for restoring stocks, special surveys were conducted in Louisiana, Texas, and Washington to determine causes of low production. Private oyster farming was recommended as one method of producing additional wartime food. To enable oyster growers to learn new methods, demonstration oyster farms were set up with State cooperation in North Carolina and South Carolina. Farming of mollusks as a means of providing more food was undertaken experimentally; only a few months' work has shown its feasibility.

Oyster cultivation has been assisted by the development of a new method of spreading quicklime on oyster beds to destroy pest starfish and by the use of a strong solution of copper sulphate to destroy young oyster drills. In the control of the boring clam, which has been found more difficult, the best method yet devised is to destroy oystershells that harbor the pests and plant clean seeds.

Sponge Investigations

There was a recurrence of the sponge blight that caused widespread damage off Florida and the West Indies 2 years ago, but it was less intense and appeared in only a few localities. The causative organism was identified definitely as *Spongiophagus*, a water-borne fungus. Florida grounds are showing good recovery, and if no further epidemic occurs a return to normal sponge-fishing operations will be possible within 2 years.

Management of Angling Resources

The war has given added importance to fresh-water angling resources, not only because of their recreational aspects but also because they make a significant annual contribution to the food supply. Intensification of hitherto limited activities in local fisheries for cold-water fishes, and the creation of new fisheries for warm-water species in areas where fishing possibilities are few, are but two of the direct measures compensating the tremendous demands now made on the commercial fisheries at all the great coastal producing centers.

The fish-management investigations that have been carried on for several years are beginning to yield positive results, particularly in the southern Appalachians, where they demonstrated that trout production can be improved greatly by consistent stocking, even in streams

ly poor in food. They have also shown that the number of trout dying from natural spawning is approximately the same from year to year and that increases in the numbers available to anglers must be supplied by artificial stocking. Experiments on conditioning hatchery fish have proved that gradual acclimatization of trout to stream conditions prior to planting results in much greater survival.

The farm-pond program, a relatively new development, offers possibilities for increasing fish production and fully utilizing undeveloped water areas. The belief of many that a fishpond once stocked will continue to produce year after year, with no attention, is erroneous.

To afford optimum conditions for good fish growth, ponds must receive care similar to that of farm lands—fertilization, control of noxious weeds, and careful cropping. Experiments are gradually developing methods that the layman can apply in good pond management. Fertilization is not only instrumental in increasing and maintaining fish production in farm ponds but is also increasingly important in the production of warm-water fishes at hatcheries. Among various fertilizers being tested are soybean meal, cottonseed meal, mixtures of sheep manure and superphosphate, and inorganic compounds. Heavy fertilization of standing waters is proving to be the most effective method of controlling undesirable aquatic vegetation, in that it does not subject fish to the hazards inherent in copper sulphate, sodium arsenite, and other chemical weed killers.

Testing artificial diets for hatchery fish was continued in various attempts to devise feeding procedures that provide good growth at low cost—an important factor in raising large quantities of fishes to fingerling or even to legal size before planting in streams.

Fish Parasites and Diseases

Diseases and parasites are the greater deterrents to hatchery efficiency. New contributions to the pathology of fishes included the isolation of the causative organism of ulcer disease, a strain of *Bacteria* *luminicida*, another strain of which causes furunculosis. Inoculations of healthy brook trout with a pure culture of the new strain produced the typical lesions of ulcer disease. Progress was made in the study of fin rot disease, which, it was determined, is caused by infection by bacteria not yet isolated in pure culture. Four new species of external protozoan parasites, occurring on gill filaments, were discovered as infestations of crappies. A new suctorian parasite of smallmouth bass was described, and highly effective techniques for controlling these parasites *Costia* and *Trichodina* by means of formalin were developed, as was the fact that bacterial gill disease can be controlled by prolonged treatment with nontoxic concentrations of potassium permanganate.

Pollution Studies

Defense production, followed by actual war conditions, has intensified existing water-pollution problems and added new or little-known types of pollution. Wastes from paper, fiber, and pulp industries including rayon and viscose plants, increased in volume; the petroleum and its derivatives opened new oil fields with attendant pollution hazards; and increased and unrestricted mining activity added volumes of silt and rock wastes to formerly unpolluted areas. War also brought great changes in the chemical industry that resulted in new wastes, some harmless and others dangerous, but concerning which little is known. The mobilization of large concentrations of troops created in some areas difficult problems of sewage disposal and sanitation.

Given full cooperation of the War Department, field investigators of the Service studied pollution problems at 30 ordnance plants; visited 12 others where no pollution occurred. With standard test equipment installed on its laboratory trucks and in permanent pollution laboratories at Columbia, Mo., Fort Worth, Tex., and Spearfish, S. Dak., complete analyses of wastes were undertaken and biologically determined the effects of their components on fishes. As rapid results warranted, recommendations for pollution control were forwarded to the proper authorities, who are giving excellent cooperation in aquatic-resource preservation.

In addition to the special investigations at Army plants, regular programs for studying industrial pollution were maintained. A report on arsenical wastes was completed, and detailed researches are being made on mine wastes and return waters from irrigation projects. A manual for the study of water pollution is being prepared.

Fish Protection and Engineering Developments

Only in recent years has attention been paid to the preservation of fish in streams affected by the construction of dams for power generation and for irrigation, flood control, and other purposes. Consequently, some fisheries have been permanently lost. Detailed biological surveys as well as the solution of problems in engineering design, construction, and hatchery development are necessary for the protection of fishery resources in waters affected.

Stream surveys were conducted throughout the Columbia River Basin to appraise the effectiveness of fishery protective measures already in operation and to learn where additional protection facilities are needed. Programs of rehabilitation were planned for the vicinity of Shasta Dam, Calif., where the former spawning grounds in the upper Sacramento River have been made inaccessible.

The procedure followed is essentially similar to that in operation at Clark Island Dam on the Columbia River, where the great height of Grand Coulee Dam prevents the use of ladders or other devices that enable fishes to pass over lower dams. The upstream migrants are trapped below the dam and hauled to new streams suitable for spawning or to holding ponds where they remain until the sex products are ripe, can be stripped, and are incubated artificially in hatcheries. Surveys in the Willamette Valley were continued in cooperation with the War Department to determine the need for fish protection in connection with four high dams scheduled for future construction. Fish screens have been used with some success for many years to prevent the loss of fishes in irrigation diversions, but their designs have not yet been standardized. Screens constructed and operated by the Service serve both to conserve fishes and to test new designs and methods of operation. Accumulations of silt and debris on the screens are troublesome, and efforts are being made to overcome the difficulty by use of baffles. Fungous growth also clogs the screens, and customary automatic cleaning methods have been ineffective, but various devices tested experimentally have proved satisfactory.

Research on Birds and Mammals

Waterfowl and Other Migratory Birds

To supply current information as a basis for sound regulation, instigational activities were concentrated on the migratory game birds, a resource of great recreational and esthetic value as well as of economic worth. The food value alone of the estimated annual bag of 15,000,000 ducks and geese is not less than \$5,250,000 and when used as food the game releases its equivalent weight in domestic poultry and other meats.

The Waterfowl Situation

The Service's minimum objective for a continental waterfowl population has been achieved, the inventory of January indicating that the stock of ducks and geese has grown to about 100,000,000 birds, more than $3\frac{1}{2}$ times the estimate for 1935.

Canada.—Sampling of conditions on important Canadian breeding grounds was continued in Nova Scotia, New Brunswick, Prince Edward Island, Quebec, Manitoba, Saskatchewan, and Alberta. A report on British Columbia prepared by the chief migratory bird officer of that Province was received through the cooperation of the National Parks Bureau at Ottawa. A trip was made to Newfoundland, followed by a survey in the Maritime Provinces during the hunting

season. In eastern Canada there was a gratifying increase in numbers in most species of nesting ducks and geese. Only those of the important black duck appeared to have decreased slightly. During the fall migration, however, this species appeared in normal numbers. In the Prairie Provinces there was little change in the general water situation. Many sloughs and pot holes visited in 1940 were dry, whereas other areas that formerly grew wheat were supporting broods of ducks. Insufficient water to last through the season frequently resulted in waterfowl losses. A few moderately severe outbreaks of botulism occurred, and comparative analysis indicated that the number of birds produced probably varied little from that of 1940. Water levels were below normal in the Athabaska Delta, and although food was abundant most lakes lacked good rearing cover. As a result ducks were less common than the year before, and it seemed probable that many had continued northward to the McKenzie Basin. The great interior valleys of British Columbia supported a somewhat larger population of breeding waterfowl than in 1940, which was particularly gratifying in the case of the diving species.

Alaska.—The biologist of the Mississippi Flyway established summer headquarters at Chevak, in the lower Yukon Valley and from that point made an extensive survey of the vast breeding grounds of the region, which indicated a satisfactory increase in both ducks and geese.

Mexico.—The biologist of the Pacific Flyway continued studies in the Valley of Mexico and in western areas. The number of ducks reaching these winter quarters was far below normal, attractive climatic and water conditions keeping them in the United States. Geese and cranes were present in numbers that compared favorably with those of other recent seasons.

United States.—Studies in the United States were concentrated chiefly about units of the national wildlife refuge system. Abundance of water throughout the breeding grounds resulted in the highest waterfowl production in many years, a fact that was confirmed by reports from volunteer migration observers. In the North Central States and generally on the Pacific coast, sportsmen had good shooting, apparently close to normal. Elsewhere, however, due to continued mild weather, the kill was light.

Other Migratory Birds

Studies of the woodcock on its breeding grounds in Pennsylvania, Maine, and the Maritime Provinces indicate slow recovery from the losses suffered 2 years ago. Regulatory action affording complete protection to the Wilson's snipe was fully justified, as reports indicate a continued decrease in its numbers. The causes are not definitely

own, and this species should be made the subject of continental investigation. Studies of the status of the mourning dove were made during fall, winter, and spring, particularly in the Southeastern States. Recovery of this species, especially the eastern form, has not been satisfactory, indicating need for additional restrictions on shooting. A definite management plan for the white-winged dove will result from investigations being concluded during the calendar year 1942, including those of the biologist of the Central Flyway who worked with through eastern Mexico to Guatemala and El Salvador, and of a special party assigned to northwestern Mexico.

Distribution and Migration Records

For reasons of economy and to limit the use of aluminum needed for war purposes, bird banding was drastically curtailed. Though practically no new permits were issued, and work with colonial species was largely suspended, cooperators reported the banding of 30,842 birds, of which 46,758 were ducks and geese. Returns and recoveries totaling 25,846 brought the grand total to more than 2,000. Distribution and migration data received from 225 observers added 44,340 records to the files. In addition, 900 locality and 817 bibliographic references were compiled.

Wildlife Surveys and Management

Wildlife Relationships to Forest and Range

In the Lake States the goldfinch, junco, chipping sparrow, and Brewer's blackbird, and the white-footed mouse, chipmunk, and red squirrel, seriously reduce both the natural and artificial regeneration of jack pine. The practical remedy after fires or logging operations is to plant seed at ebbs in these animal populations and to treat the seed with certain recently developed repellents. Experiments show that bird damage to longleaf pine reproduction in Mississippi and Florida, is partially offset by direct seeding following planned burning. Studies on the San Joaquin Experimental Range, Calif., reveal that the ground squirrel, kangaroo rat, and cottontail rabbit compete directly with livestock for forage. Damage by the pocket gopher to vegetation in foothill areas is adequately compensated through benefits resulting from the presence of this rodent. Pneumonia and malnutrition contribute to constant fluctuations in the numbers of all species of rodents and rabbits and of some species of birds. Investigations at the Squaw Butte Experimental Range, Oreg., show that rodents prevent the reseeding of crested wheatgrass in midsummer. The remedy appears to be artificial seeding in periods of rodent scar-

city. A plague of meadow mice destroyed 50 percent of grass, 25 percent of bitterbrush and other browse plants in some Oregon areas. Experiments were begun in Montana and Idaho to determine the effects of fire on rodent populations and the measures necessary to protect forest plantations from rodents. Pocket gophers are of importance on Rocky Mountain and Intermountain ranges in relation to livestock grazing. Overutilization of range by livestock and deer constitutes a serious problem in Nevada and California forests, and recommendations were made for liberal reductions in livestock herds in critical areas. Damage to ponderosa pine in Arizona by Abert squirrels was controlled by live trapping for several years in other areas and by supervised hunting.

In Arizona and New Mexico jack rabbits were most abundant in overgrazed livestock areas. Smaller numbers were noted on some ranges, and an increase on good grass lands. Active cooperation in the work on forests and ranges included the Forest Service, Game Service, Soil Conservation Service, and State conservation departments.

Cooperative Wildlife-Management Research

Active cooperation with the land-grant colleges, State conservation departments, and the American Wildlife Institute was continued in wildlife management research in 10 States representative of all regions (table 1). As in preceding years the major objectives were: (1) Research on important problems in wildlife management, (2) training young men for management and investigative work, and (3) cooperation with all agencies in translating research findings into active programs and practices. A brief tabulation of activities follows:

TABLE 1.—Activities in cooperative wildlife-management research, 1942

Units	Projects		Graduate students trained	Active cooperators	Units	Projects		Graduate students trained
	Carried	Completed				Carried	Completed	
Alabama	6	0	7	15	Pennsylvania	11	2	1
Iowa	10	2	8	17	Texas	7	0	1
Maine	8	3	6	18	Utah	9	4	1
Missouri	17	7	13	22	Virginia	11	5	1
Ohio	12	5	8	15				
Oregon	7	4	8	16	Total	98	32	70

† Wildlife under investigation: Wild turkey, quail (bobwhite and mountain), ring-necked pheasant, grouse (ruffed and sage), mourning dove, woodcock, Hungarian partridge, deer (white-tailed and blacktail), antelope, snowshoe hare, cottontail rabbit, squirrel (gray and fox), muskrat, beaver, opossum, weasel, red fox, predators, and waterfowl.

Biological Investigations on Wildlife Refuges

In the Wichita Mountains Wildlife Refuge, Okla., rainfall above normal produced a heavy growth of annual forage plants and an increase in long grasses, possibly crowding out some of the valuable short grasses. The small herd of introduced pronghorn antelope is slowly increasing. On the Sheldon National Antelope Refuge, Nev., and the Mt. St. Helens National Antelope Refuge, Oreg., competition between wild game and domestic stock and the range requirements of the antelope were studied. A cover-type map of the Sheldon Refuge was completed in cooperation with the Grazing Service and a management plan projected.

State Biological Surveys and Faunal Studies

Investigations were continued on a biological survey of the State of Washington, a report on the biological survey of the Aleutian Islands is nearing completion, a manuscript was completed for publication as a North American Fauna on the habits, classification, and distribution of North American wolves, work progressed on revisions of the classification of American pumas and the white-tailed deer, and a study was completed of the marten of the northern Rocky Mountains, with plans for its management. From surveys an estimate was made of 64,391 big-game animals in the United States at the close of 1940. The mammal collection was increased by 800 specimens, 496 specimens were identified for other institutions, and 706 were loaned. To the bird collection were added 935 specimens, 819 specimens were identified for other institutions, and 716 were loaned. A leaflet describing the Biological Surveys mammal collection was issued. Service biologists described 12 new mammals belonging to the genera *Canis*, *Urocyon*, *Lutra*, *Nasua*, *Onychomys*, *Peromyscus*, *Pitymys*, *Tamias*, *Thomomys*, and one new bird of the genus *Colinus*. The Biological Surveys laboratories were used by more than 150 cooperative research workers.

Economic Investigations on Wildlife

Wildlife relationships.—Studies were continued in cooperation with the Bureau of Entomology and Plant Quarantine, Department of Agriculture, of the relationship of birds to rice production, particularly to the control of insect pests of rice. Investigations were made of waterfowl depredations on crops in Colorado, Utah, Idaho, and Washington and of the effectiveness of control methods. In surveys of damage by starlings to horticultural crops, methods for prevention

were tested. Economic relationship studies involved bald eagles, band-tailed pigeons, gallinules, owls, foxes, raccoons, and cats. Cooperation in wildlife food studies was extended to Federal and State agencies, and eight State conservation agencies utilized the Service's laboratory facilities for work on wildlife problems. Completion of field research on the economic status of the Canadian porcupine included the development of measures that eliminate losses due to local concentrations in timber and forest production and maple-sugar production areas and in orchard and crops. A color motion picture on the subject was filmed and will be available for public use.

Control Methods

Coyote control.—Research on coyote control methods included to determine the efficacy of a new device, the "coyote-getter," a discharging cartridge. Results obtained from 82,000 traps and 107,000 set days with the new device disclosed that the device is less destructive than steel traps to domestic sheep, big game, furbearers, and large birds of prey and that the trap is superior for use in cattle pastures and in sections containing bears and dogs, but more subject to interference by rodents. The coyote-getter was generally more effective in severe weather; the trap in mild weather. The new device is being used to a limited extent in coyote control in the Western States to supplement trapping operations.

New or substitute control poisons.—As the war has cut off imports of thallium, squill, and strychnine, programs of predator and rodent control must depend upon poisons that can be effectively used as substitutes. Tests thus far made indicate that zinc phosphide, though not so consistently satisfactory, may serve in place of strychnine and thallium in rodent control.

Propagation of red squill.—Toxic red squill, a most important poison formerly imported from Mediterranean countries can be grown in the United States, although the supply of bulbs and seed for this purpose is limited. Experimental propagation of the plant is being developed through cooperation with the Bureau of Plant Industry of the Department of Agriculture. Red squill requires 4 to 5 years, however, to mature. It is hoped that through careful selection of tests marked increase can be made in the toxicity of bulbs and seed. Numerous cooperators from Florida to southern California are engaged in this effort. The process for the fortification or strengthening of low-grade squill powder developed by the Service last year is now put to practical use in rat-control work. In addition to the Government-operated fortification unit at Denver, a plant was set up at Louisiana under technical direction of Service scientists.

Control of rabbits on southwestern ranges.—Ranches in the Southwest have been periodically confronted with ravages by jack rabbits and other rodents on the open range, particularly under the combined pressure of livestock and drought. Removal of livestock alone will not correct the situation—the rabbits also must be removed for a season. An investigator is working on a low-cost method for range control on areas of relatively low forage production.

Black rat control.—An experienced investigator was sent to Florida to develop control methods for black and Alexandrian rats in the southern coastal areas and at ports where the entrance of rats infested with plague or typhus-bearing parasites might occur.

Eagle studies.—Federal legislation giving protection to the bald eagle in all parts of continental United States except Alaska has focused attention on its economic relationships, but investigations of the status of this and the golden eagle have been largely stopped by war conditions. The bald eagle is relatively uncommon over much of the United States though still abundant in the coastal region of southern Alaska, despite being long subject to bounty payments there.

Upland Game Birds

Nutrition and physiology of upland game birds.—As a basis for management, comparative studies were made of the feeding of immature ring-necked pheasants and ruffed grouse. In studies of nutritional requirements of breeding bobwhite quail the effects of various kinds of feed on the health of these birds were extensively tested, certain ones showing important results in the lowered death rate of young birds. The symptoms of vitamin A deficiency in quail were determined.

Upland game management.—The results of stocking a pure strain of wild turkey on Bull Island, S. C., in 1940 were encouragingly successful, as there was a marked population increase after two breeding seasons. Cooperating with the Forest Service, Department of Agriculture, a management unit known as the Wambaw Wild Turkey management area was established on the Francis Marion National Forest, S. C.

Waterfowl Habitat Studies

Marsh management.—Surveys were completed of the 200,000 acres of wildlife refuge land in Louisiana, and recommendations made to state authorities for needed biological improvements for fur, fish, and other wildlife resources. Investigations of waterfowl habitats demonstrated the relation of shallow water areas and cyclic organisms to the occurrence of duck sickness and pointed to remedial management measures. Grazing was shown to be an aid to maintenance of desir-

able goose and shorebird habitat. Habitat and economic relations of the sandhill crane were investigated on breeding grounds in Oregon and on wintering areas in New Mexico and Texas.

Mosquito control in wildlife habitat.—Completion of a 4-year study on means of coordinating necessary mosquito control with wildlife conservation demonstrated that by developing appropriate water-control structures in coastal or tidal marshes so as to maintain fishes at all times, mosquito breeding usually is practically eliminated and that improving such marshes for waterfowl may afford local control of mosquito production. In cooperation with the Tennessee Valley Authority, an analysis was completed of the results of malaria-control practices at power and flood-control reservoirs.

Propagation of waterfowl food plants.—In studying optimum storage conditions for the germination of seeds of five valuable species of bulrush, in cooperation with the Bureau of Plant Industry, it was found that material stored wet gives uniformly better results than that kept dry. The effects of changing salinities and of silting on the production of marsh and aquatic plants were recorded for the tidal section of the Potomac River. Successful experimental plantings of waterfowl foods were made in storm-created ponds at the Delta National Wildlife Refuge, La.

Control of pest plants.—Changing undesirable to desirable plant associations and maintaining the latter is imperative in developing and managing areas for producing game and fur. Intensive investigations were made on refuges in Louisiana, Tennessee, New Mexico, Oregon, Utah, and Maryland. Experiments in plant growth control by alteration of water levels, by planting desirable competing species, by use of chemical agents and mechanical devices, and by grazing and burning, showed that each method is effective under appropriate conditions.

Fur Animal Conservation and Restoration

Wartime Use of Furs

To render maximum service toward insuring that our armed forces in cold climates shall be properly equipped with warm clothing, the fur resources program was reorganized, cooperative arrangements were entered into with the Quartermaster Corps and the War Production Board, and the Secretary of War appointed an official of the Service as fur consultant. The Service supplied samples of numerous furs for use in determining their frost-resistant qualities and testing their suitability for sleeping bags and certain types of clothing. At the request of war agencies, comparative tests of furs and fabrics were initiated in cooperation with the Bureaus of Home Economics

Animal Industry of the Department of Agriculture. The receipts for furs sold by the Service amounted to \$2,466,308. These comprised furs taken on national wildlife refuges, \$73,891.77; predatory animal pelts, \$22,389.47; experimental and miscellaneous skins, \$28.76; and fur seals and blue foxes, \$2,360,698.

Cooperative Research

Fur-fiber investigations.—Continuing the study of factors contributing to desirable quality in pelts of fur animals, a preliminary analysis was made of inherited fur fiber characteristics associated with woolli-ness in domestic rabbits. Studies of luster in Karakul sheep pelts were furthered by construction of new apparatus, and information on the characteristics of Persian lamb curls was assembled from available foreign literature, contributing to investigations conducted in cooperation with the Bureau of Animal Industry. Toward the close of the year the entire program was so revised as to handle new projects having direct bearing on the war. These include studies of suitability of furs and fur fibers for war use, and the utilization of waste fur and fur scraps.

Reproduction studies.—In studies on the reproductive cycles of fur animals, continued in cooperation with Swarthmore College, work on the silver fox was concentrated on the relation of onset of heat to estrus, maturation of the ovum, sperm transport and respiration, spermatogenesis, and on chromosomes. A survey of breeding practices in mink ranching was begun. Relationship between delayed implantation and long gestation period in the marten was established. Seal reproductive and embryological material was also studied.

Nutritional research.—Nutritional studies on fur animals conducted in cooperation with Cornell University have shown that silver foxes require vitamins A, B₁, D, nicotinic acid, and the antigrey hair factor. The minimum requirements of foxes and minks for vitamin A were determined. The effects of thiamin deficiency and Chastek paralysis in foxes were found to be identical. A series of digestion trials showed that both minks and foxes digest cooked starch to the extent of 90 percent or more but that they do not digest raw starch so well. An estimate was made of the maintenance-energy requirement of adult foxes and minks. Studies were continued on the digestibility of high protein feeds by foxes and on the relation of nutrition to urinary calculi and Chastek paralysis in minks.

Fur-Animal Experiment Stations

New York.—Wartime conditions have demonstrated the wisdom of developing substitutes for raw meat in feeding fur animals. Experiments at the station near Saratoga Springs showed that beef meal, fish

meal, and tripe can be used to replace half the raw meat in summer mink rations. Preliminary studies indicated that mating minks on two consecutive days after March 9 or 10 is as satisfactory as the usual practice of mating them several times at weekly intervals. Observations were made of the effect on the quality of fox pelts of shaded fur sheds as compared with open, raised wire pens. Data obtained during the fox breeding season indicated a definite correlation between vulvar size, cell structure, and ovulation. Experiments are in progress to determine the minimum calcium requirements of growing fox pups.

California.—In a 27-month test at the Rabbit Experiment Station at Fontana, in which 56 does and 2,758 young were self-fed during the lactation period, it was found that a ration containing a limited number of cereal grains is satisfactory when the rabbits are given free choice of one or more grains in conjunction with a plant protein supplement and legume hay. The normal body temperature for rabbits was determined to be 103.6° F. Encouragement was given to the use of domestic rabbit meat in the Food for Freedom campaign.

Maryland.—Muskrat investigations at the fur animal field station on the Blackwater National Wildlife Refuge included correlation of house count with pelt production per acre and field studies of trapping management methods, effects of sex and season on market classification of pelts, and feeding and breeding habits. The value of fur research on the refuge was enhanced by the establishment there of a Weather Bureau observation unit. Studies of the muskrat and nutria in pens were expanded. Musk glands of muskrats and beavers and testes of muskrats were collected for the Bureau of Animal Industry for analyses with a view to the isolation of new compounds to point the way to an interpretation of steroid hormone metabolism. Embryological material also was assembled to complete the representation for the year. Upon request, a study was made of the possibilities for raising muskrats in the Mobile Bay Delta, Ala.

Wildlife-Disease Investigations

Fur animals.—Through laboratory and field tests an increased margin of safety in distemper vaccine for use with farm-raised minks has been achieved by prolonged exposure of the virus to formalin. A valuable contribution to knowledge of the hosts of canine distemper was made by the detection of this disease in a zoological park in red, gray, and kit foxes, raccoon dogs, coyote-dog hybrids, and dingoes. A source of loss in domestic rabbit has been eliminated by the recognition and removal from forage of the woollypod milkweed (*Asclepias eriocarpa*).

Big game.—The practice of vaccinating the buffaloes on game refuges against brucellosis is being continued, and a considerable num-

of young immunized animals are now safe for introduction into localities.

Bird diseases.—Measures for the control of infectious rhinitis in al have been improved by the use of bacterins in combating the secondary invading organism. An important relationship of the bacterium *Pseudomonas aeruginosa* to *Clostridium botulinum* in outbreaks of western duck sickness has been discovered, and steps are being taken to apply this finding in more effective control measures.

National Park Wildlife

The study of the relations of predators to Dall sheep and caribou, begun in 1939 in Mount McKinley National Park, was completed. The presence of a rather stable wolf population the sheep numbers do not to have varied greatly in recent years, as it is generally the weaker animals that are captured. Wolf predation on lambs during their first winter seems the most important factor in stabilizing the sheep population. The caribou, which is the main wolf food, is a preferred species in respect to sheep and appears to be maintaining its numbers. No evidence was found of eagles preying on Dall sheep lambs.

A thorough range survey of Glacier National Park led to the coordination of the horse-grazing program with improved wildlife, vegetation, and soil-management practices. In Kings Canyon National Park, studies of grazing pressure by pack and saddle stock led to recommendations for the protection of scenic and recreational areas. Studies were made of livestock grazing in Arches and Zion National Monuments and Carlsbad Caverns National Park, and of winter range in Yellowstone National Park and of the possibilities for disease and probable consequent losses in big game. Survey of the critically overbrowsed condition of Zion Canyon in Zion National Park showed that tree and shrub reproduction is impossible with present deer numbers. As previous live-trapping of deer proved ineffective, more drastic reduction is imperative. Damage to forests by porcupines was investigated in Bryce Canyon National Park and Montezuma National Monument.

Inventories were made of wildlife populations in Kings Canyon, Sequoia, and Kings Mountain National Parks, Joshua Tree National Monument, and Cape Netarts State Park. A survey of Custer National Recreation Demonstration Area was made to determine the possibility of reintroducing big-game mammals. Inventories were made of the flora of Organ Pipe, Arches, and White Sands National Monuments and of the proposed Big Bend National Park. Cooperation was extended to military authorities at Fort Knox in reintroducing game and fur animals and at Fort Story in plans for mosquito control.

Investigation of aquatic resources were made in Kings Canyon National Park and Boulder Dam National Recreational Area. Waters of five recreational demonstration areas in Pennsylvania were inspected by Service and State biologists in a movement to formulate a fish-stocking policy for all areas in that State. A study of waters in Shenandoah National Park was made as a basis for determining streams to be stocked and for preparing fishing regulations.

Wildlife on Indian Lands

Wildlife research and conservation activities of this Service were this year extended to cover all Indian lands in the United States—about 55,000,000 acres. Under an agreement with the Indian Service, approved August 7, 1941, a project for investigations of wildlife on Indian lands was organized in the Fish and Wildlife Service to work on the conservation of wildlife resources of reservations and the increase of food and fur therefrom. Practical problems studied included food production from salmon, bison, deer, and other species; fur production from beavers, muskrats, and other fur animals; rodent and predator control; conservation and management education; drafting wildlife laws; and coordination of Indian and State conservation activities. The facts disclosed and the recommendations made had the following results: Six tribes enacted laws to maintain high yields of prime beaver pelts; management of the Crow buffalo herd, largest in the United States, was directed toward meat and hide production; salmon fishing was regulated on the Columbia River and on the Quillayute Reservation, Wash.; Indian claims to fish trap sites in Alaska were suspended to prevent hindrances to salmon production during the war; and wartime development of wildlife resources on the Colorado Reservation was begun by using Japanese evacuees.

National Wildlife Refuge Program

Land Acquisition

The program of land acquisition for national wildlife refuges was greatly curtailed by economic conditions brought on by the war. Early in the year it was decided not to institute arbitrary condemnation cases but to proceed only with those already filed.

The Migratory Bird Conservation Commission, at its only meeting of the year, on January 27, approved the Service's recommendation for the lease of 1 tract of 4,756 acres and the acquisition of 203 parcels totaling 23,511 acres in 22 refuge units, as follows: Bear River, Utah (an easement); Blackbeard, Ga. (headquarters site); Brigantine, N. J., 4.6 acres; Chassahowitzka, Fla., 4,837 acres; Chincoteague, Md.-Va., 10,000 acres; Horicon, Wis., 695 acres; Kentucky Woodlands, Ky., 248 acres; Lake Ilo, N. Dak., 144 acres; Lake Isom, Tenn., 11 acres;

Little Pend Oreille, Wash., 681 acres; Long Lake, N. Dak., 320 acres; Lower Klamath, Oreg., 1,275 acres; Necedah, Wis., 87 acres; Okefenokee, Ga., 980 acres; Parker River, Mass., 417 acres; Reelfoot, Tenn. (headquarters site); Santa Ana, Tex., 2,014 acres; Skagit, Wash., 81 acres; Tamarac, Minn., 212 acres; Union Slough, Iowa, 905 acres; White River, Ark., 532 acres; and Willapa, Wash., 65 acres.

On 29 refuges 121 acquisitions were closed, adding 58,394 to the acreage already under the jurisdiction of the Service. Appraisals were made of 331,000 acres for the program under the Federal Aid to Wildlife Restoration Act, and by Executive order there were reserved 3,114 acres of public lands in Arkansas and Washington under the jurisdiction of the Department of the Interior for use by the State game commissions in connection with State wildlife refuges established under that act.

Executive orders added 4 national wildlife refuges—the Kenai National Moose Range and the Kodiak, both in Alaska; the Safford, Ariz., and the Susquehanna, Md., involving 4,657,000 acres of public domain, 245 acres transferred from other agencies, and 2,895 acres leased—and one wildlife-management area of 81,049 acres, the Beltrami, Minn., for administration under Service custody by the Minnesota Department of Conservation, through the transfer of jurisdiction from the Department of Agriculture to the Department of the Interior; and enlarged the St. Marks Refuge, Fla., by 40 acres of public lands. Three easement refuges—the Creedman Coulee, Halfbreed, and Lamesteer, Mont.—involving 80 acres of public domain and 6,826 acres of land under gratuitous easement were added.

Surveys were made of 654 miles of boundary and interior lines; and 87 miles of boundary were staked for fence construction. Survey descriptions for title examination and preparation of deeds of conveyance for 411 tracts were completed on approximately 86,731 acres.

In March the Bureau of Yards and Docks of the Navy Department made the first of many requests for appraisals of lands for war purposes, and at the close of the year practically the entire land-acquisition personnel was engaged in evaluating and surveying lands and preparing reports and maps for that Department.

Development of Refuges

Despite great curtailment in the use of CCC, WPA, and NYA labor on wildlife refuges, development progressed considerably. The WPA furnished 5,747 man-months of employment, of which 1,173 were used on road improvements essential in the national emergency. The projects were operated principally in localities where relief labor was not required in connection with the war program.

In the past the CCC provided the labor necessary for extensive development operations on Federal refuges, but this year, in order to

furnish the greatest possible aid to the war program there was a transition of CCC activities from refuge development work to important war work and the number of camps assigned to the Service was reduced from 36 to 12. Of these, 4 were engaged in the development and improvement of military areas, and arrangements were completed for utilizing 8 camps on military areas or on projects necessary for the protection and conservation of national resources that are important to the war program. The work accomplished by the 4 military camps is typical of the contribution made to the war program by the CCC. It consisted of constructing and improving truck trails, fences, communications systems, bomb-storage shelters, pipe lines, rifle ranges, and recreational areas and in improving areas by mosquito control. Camps not detailed to military areas were assigned the important task of protecting natural resources, which involved the construction and maintenance of fire breaks and fire lines, extensive reduction of fire hazards, fire fighting, completion of water-control structures, dikes, dams, and other water-utilization projects, and biological development.

Administration and Management

The number of national wildlife refuges now administered by the Service is 272 (17,643,915 acres) (table 2), of which 254 (9,592,713 acres) are in the United States and 18 (8,051,202 acres) in Alaska, Hawaii, and Puerto Rico, 2 having been dropped from the list—Siskiwit, Mich., and Expedition Island, Alaska. Executive orders established 7 new refuges, and 8 refuges (1,272,407 acres) were placed under active administration with permanent personnel assigned. Exclusive of easement refuges, 101 units (11,960,268 acres) are now operated by a staff of 261 permanent and 36 part-time personnel, about the same as last year, although the acreage increased 12 percent, assistance from CCC and WPA was practically eliminated, and many employees were on military furlough with the armed forces. War restrictions on the purchase of tires, equipment, and repair parts reduced the operation of automotive and other equipment drastically, the permitted mileage for cars and trucks from a third to a half that of the previous year.

TABLE 2.—Classification and acreage of national wildlife refuges administered by the Fish and Wildlife Service

Classification	Number	Acres
For migratory waterfowl.....	184	2,962,025
For other migratory birds and general wildlife.....	25	3,973,754
For colonial nongame birds.....	46	104,149
For big game.....	16	10,601,364
Patuxent Research Refuge, Md.....	1	2,623
Total.....	272	17,643,915

Funds received from the Sixth Supplemental Defense Act of 1942 for the emergency protection of forests, forest industries, and important facilities were expended for that purpose on a number of refuges. Fires on refuges totaled 169 and involved 32,195 acres. Moneys made available under a special appropriation for soil and moisture conservation activities were allotted to 10 refuges.

For use for bombing and artillery ranges, troop maneuvers, military bases, emergency landing fields, and other war purposes, the Service turned over to the War and Navy Departments for the duration 972,987 acres of refuge lands—primarily submarginal areas in the South and Midwest and parts of large areas in the West used jointly for wildlife and livestock. No highly developed wildlife areas were released and little or no harm to wildlife has resulted from military activities.

Bird Refuges

The following bird refuges were established by Executive orders: Ash Creek (Safford), an upland game-bird area of 240 acres in Graham County, Ariz., transferred from the Soil Conservation Service (E. O. April 20, 1942); Susquehanna, an area of 2,900 acres in Cecil and Harford Counties, Md., primarily a resting and feeding refuge for ducks during migration (E. O. June 23, 1942); Creedman Coulee, an easement area of 2,684 acres in Hill County, Mont., as a waterfowl nesting and resting refuge (E. O. October 29, 1941); Halfbreed Lake, an easement area of 3,097 acres in Stillwater County, Mont., for waterfowl nesting and resting (E. O. May 19, 1942); and the Lamesteer, an easement area of 800 acres in Wibaux County, Mont., also for waterfowl nesting and resting (E. O. May 19, 1942).

Most of the waterfowl nesting refuges had more water and were in better condition than ever before, and several had an abundance of water for the first time since their establishment. The spring run-off gave the water-control structures the most severe test since their installation. Most of them proved adequate, although some suffered damage necessitating minor repairs.

Big-Game Refuges

Two new big-game refuges were established, both in Alaska: The Kenai National Moose Range (2,000,000 acres), for the protection of the giant Kenai moose and other wildlife (E. O. December 16, 1941); and the Kodiak National Wildlife Refuge (1,957,000 acres), for the protection of the brown bear and other wildlife (E. O. August 19, 1941).

The numbers of big-game animals on the fenced big-game areas are given in table 3.

TABLE 3.—Number of animals on fenced big-game areas maintained by the Fish and Wildlife Service

Harvesting Refuge Crops

Extensive habitat improvement and other development work on refuges is resulting in greatly increased wildlife production. The restoration of drained marsh areas has served to increase substantially not only the numbers of waterfowl but also of fur animals, the pelts of which are of great value in outfitting troops in northern climates. In all, 153,000 muskrats and other fur animals were taken from refuge lands. Reconditioned water areas are producing enough fishes to permit the removal not only for sport but also for commercial purposes, thus supplementing the take of salt-water fishes that has been reduced because of naval and military coastal activities.

To keep the herds of big game at a level consistent with the available range, 136 buffaloes, 71 elk, 60 white-tailed deer, and 17 Texas longhorns were transferred from the 4 fenced big-game refuges to State conservation commissions for restocking or were sold or donated for exhibition, propagation, or food. The harvesting of wildlife from the refuges for restocking other public lands and through controlled public hunting increased greatly. Permits issued to State conservation departments authorized removal of 41,200 ring-necked pheasants, 1,215 deer, and 1,620 fur animals for restocking State areas, and more than 50,000 ducks and upland game birds were taken on lands open to public hunting. Grazing by domestic livestock, hay harvesting, agricultural crop production, timber cutting, and other economic uses of refuge lands were permitted wherever they would have no adverse effect upon wildlife. The total revenue from the lease of refuge lands and the sale of surplus refuge products was \$100,396.26.

Federal Aid in Wildlife Restoration

The benefits of 4 years' operation of the Federal aid in wildlife restoration program under the Pittman-Robertson Act are becoming increasingly apparent. Projects approved are being utilized by State game departments to gather information on scientific and administrative problems for which State funds had not been available; areas for wildlife restoration and perpetuation are being acquired; and developments are being made on private and public lands for game and fur production. The Federal Aid to Wildlife Restoration Act was amended to extend its benefits to Alaska, Hawaii, Puerto Rico, and the Virgin Islands. Restoration projects were inaugurated in all these areas except Hawaii, where action was postponed because of the war.

Acquisitions made by 18 States this year for wildlife breeding, feeding, and resting grounds totaled 150,081 acres, representing largely additions to existing State programs. Examples are the placing of many scattered refuges and game management units in Pennsylvania, Michigan, Iowa, Utah, and Washington; acquisition by Kansas of 6,800 acres in the Cheyenne Bottoms for developing a combination waterfowl refuge and public shooting ground; purchase by Wisconsin of land to restore the southern part of the famed Horicon Marsh; and purchase by Florida of 19,130 acres in the Charlotte County game management unit for deer, wild turkeys, and bobwhites.

A comparatively recent development in wildlife management has been the restoration by Federal aid of desirable species through soil-conservation practices. Game departments of Virginia, Florida, Alabama, Mississippi, Louisiana, Arkansas, Texas, Nebraska, Idaho, and Washington are supplying farmers in soil-conservation districts with seeds of soil-holding plants for use on field borders, gullies, and odd corners that cannot be successfully cultivated but will provide essential cover and food for game birds and mammals. Missouri conservation officials have cooperated with farmers in building ponds in areas deficient in surface water, to serve as refuges and breeding places for fur animals, waterfowl, and upland game birds and to provide water for domestic animals.

Many States are stocking depleted ranges with native wild-caught birds and mammals. Texas had unusual success with wild turkeys and reports increases up to 400 percent from transplantings. Virginia, West Virginia, Florida, and Texas transplanted white-tailed deer from areas where plentiful to those where scarce. New Mexico, Colorado, Wyoming, and Texas did the same with antelopes; and Alabama, Mississippi, Idaho, Oregon, Montana, and Wyoming, with beavers.

The 46 cooperating States, Alaska, the Virgin Islands, and Puerto Rico submitted and had approved 301 projects involving Federal funds of \$2,075,476.76. Of these projects, 111 (\$857,497.49) were for the purchase of lands, 99 (\$620,001.39) for developments of lands and

waters, 70 (\$490,901.64) for surveys and investigations into problems of wildlife management, and 21 (\$107,076.24) for direction and co-ordination of the wildlife restoration programs undertaken by the States.

Does not include funds unexpended and unobligated during availability and transferred for carrying out the provisions of the Migratory Bird Conservation Act.

¹ Apportionment of Federal funds to Alaska, Puerto Rico, and the Virgin Islands was made on November 19, 1941.

² Credit adjustments (italic figures) during the fiscal year 1942.

³ Not eligible to participate.

⁴ Unexpended funds on completed projects have been deducted from this column and credited for future use.

Propagation and Distribution of Food and Game Fishes

Hatchery Production

The record of fish-hatchery production deviates from previous records in that it covers the calendar instead of the fiscal year, a change adopted because both the practical aspects of hatchery operations and the reproductive cycles of fishes impose a definite break, or seasonal interruption, in midwinter. Moreover, planting young fishes from the hatcheries corresponds in season to the annual increment from natural reproduction, and an accurate impression of yearly accomplishment cannot be gained if the tabulations are summarized in the middle of the propagating and distributing period. In presenting totals, therefore, there is an overlapping of 6 months and certain lots of fishes will appear in both reports. The duplication is more seeming than real, however, as the current report does not include figures for 2 consecutive reproductive periods for any species.

The gross production of fishes and eggs for the calendar year 1941, the output of 119 fish-cultural stations, some of which were under construction, was 5,862,960,200, a decrease of more than 15,000,000 from that of the fiscal year 1941. Among the groups showing increased production were six species of game trouts, both the largemouth and smallmouth black basses, and four species of Pacific salmon. The take of eggs of the buffalofish, an important freshwater commercial species, was doubled. The eggs were fertilized and planted on the spawning grounds, as also is done with eggs of groundfishes along the New England coast.

The policy of not releasing game fishes until they reach a larger size was reflected in an increase of about 10,000,000 fingerlings. There were decreases in several of the marine commercial species and in some of the lesser pan and game fishes.

The Carbon Hill, Ala., Hebron, Ohio, and Moorefield, W. Va., pond-fish stations operated on a productive basis for the first time. Two cooperative seasonal units were not used—the Senecaville, Ohio, station was not opened in the spring because of an inadequate water supply; and the Barneveld, N. Y., station was permanently closed.

Salvage operations along the Upper Mississippi River were insignificant in comparison with those of earlier years. Slightly more than half a million stranded fishes were seined from overflow areas.

Construction

All new hatchery developments and work on the partially completed unit at Farlington, Kans., were suspended at the outbreak of the war, but projects well advanced were continued, including hatch-

eries at Williams Creek, Ariz. Salem, Maine, Austin, Tex., and
ing, Ark. The substations for salmon propagation at Winthe
Entiat, Wash., built by the Bureau of Reclamation, are part
field establishment supervised by the Service and the latter was
in partial operation. The Bureau of Reclamation continued the
struction of the large Sacramento River salmon hatchery at Col
Calif.

Cooperation With Other Conservation Agencies

A decline in the number of applications for fishes submitted by
private individuals does not indicate a lessening of demand but
reflects the Service's policy of handling fish distribution through
conservation departments and other official bodies responsible for
management of lands and waters. The advantages of thus con
ing fish distribution have become increasingly evident, and though
much remains to be done in extending this policy, it has proved
type of informal Federal aid that results in greater returns from
expended.

Cooperative Predator and Rodent Control

The control of predatory animals and injurious rodents con
tributes to fulfilling the Service's obligations during the war
by increasing the food and feed supply through reducing depreda
of ground squirrels, jack rabbits, prairie dogs, and other rodents
growing and stored crops and range forage and reducing rat dan
city, town, and country; by increasing the food supply and ma
terials for clothing through protecting sheep, goats, and calves
slaughter by coyotes, wolves, and other large predators; and by
guarding public health through the destruction of rodent and pre
carriers of bubonic plague, typhus, rabies, and other infe
diseases.

In cooperative predator and rodent control, expenditures
made of \$873,597 from departmental funds; \$536,933 from coop
ing States; \$1,055,576 from cooperating counties, livestock and
cultural associations, and others; and approximately \$254,146
emergency funds.

Predator control resulted in the taking of 111,076 coyotes
wolves, 10,957 bobcats and lynxes, 204 mountain lions, and 639
tory bears, a total of 123,667. In rodent control operations, 728
acres of infested lands were treated under direct supervision
13,703,158 under general instructions. In cooperative rat con
assistance was given local communities in organizing rat control

, including permanent control measures. The Service's Supply and Laboratory at Pocatello, Idaho, prepared and distributed 224 pounds of rodent bait materials to cooperators throughout country and manufactured and distributed other equipment andplies used in predator and rodent control operations.

Destruction of Food and Property

Because of inability to apply control measures in all areas, heavy losses often occur in localities where destructive rodents and predators are numerous, as illustrated by the following instances.

In Arizona a goat raiser near Aquila, and his neighbor, lost 200 to goats annually to predators, and a sheep raiser reported that untain lions killed 26 sheep in one night in March. In the raine area of Florida, cotton rats destroyed \$10,000 worth of tomatoes and eggplants on 250 acres. At Belfield, N. Dak., a rancher lost many sheep to coyotes that he had to dispose of a flock of 200 sheep t he had owned for a year and a half; and in Slope County, N. Dak., er small flock owners report annual losses to coyotes of 15 percent of ir flocks. A poultryman in Pennsylvania lost 1,500 week-old chicks rats in one night. In a Rhode Island orchard 300 apple trees were killed by meadow mice with a loss of \$4,500. On a sugarbeet-seed ntation in Weber County, Utah, field mice destroyed 10 acres of ing plants having a value of \$3,000. On a farm near Georgetown, , wolves killed 192 pigs valued at \$768 and 46 calves worth \$368.

Conserving Food and Feed Supplies

f, as has been stated, food will win the war, every effort must be de to produce and to conserve it as a vital factor. To this end Service has cooperated with State agencies, local livestock, altry, and agricultural interests, individuals, and military establishments in preventing the destruction and damage of food and feed predators and rodents. The chairman of the United States partment of Agriculture War Board of Cass County, Tex., expressed nks to the Service for helping acquaint the farmers with the icultural outlook in the Food for Freedom program, stating that plan for controlling pocket gophers in and around peanut fields l greatly assist farmers in meeting their peanut quotas and that plan of directly coordinating work toward the war effort will terially assist them in meeting their goals.

Cooperative rodent control has been carried on about cultivated l grazing areas to protect growing farm crops and forage, and red food and feed has been protected from rat and mouse damage meeting increased demands from many areas for cooperative

assistance. Rat and mouse destruction of grain in elevators and mills has been severe. Toxic baits have been used extensively in combating it, but sanitary and rat-proofing methods of control have been stressed to insure more lasting results. Cooperation has been extended to counties and cities in organizing intensive permanent rat-control projects and to State, county, and local livestock organizations and individuals in organizing and supervising intensive control programs to protect sheep, goats, cattle, pigs, and poultry from the larger predators, thereby safeguarding the Nation's meat resources. In 4 counties in South Dakota and 6 in North Dakota cooperative control operations reduced the average annual sheep loss to coyotes from 10 to 2 percent. Application of the Service's rat-control methods stopped the following losses: \$10 weekly to foodstuffs in a grocery market in Florida, \$300 annually to a turkey grower in Maine, and \$2 a ton on 2,000 tons of stored feed at a cottonseed oil warehouse in Texas. Rats were controlled also in a military warehouse and an airport hangar in Texas, where they were cutting cords from parachutes and chewing fabric and stitching off the wings of training planes. In September, a Service hunter reduced destruction by taking 6 coyotes in 6 days from an area in Nevada, where, during a 14-day period, 3 purebred Hereford calves valued at \$50 each were lost. In Catron County, N. Mex., cooperative pocket gopher control effected a 25-percent increased yield of potatoes from a 20-acre field. The carrying capacity of a 40-acre pasture in Beaver County, Okla., increased five times after removal of prairie dogs at a total cost of \$3. Capture of one bear that killed 20 adult sheep last fall in Summit County, Utah, ended depredations.

Conserving Raw Materials for Clothing

In the Western States the more than 37,000,000 adult sheep and lambs that graze on open ranges that are infested with coyotes and other large predators have been protected by the Service's cooperative control operations conducted over the greater part of the range areas, and thus losses of essential raw materials have been reduced.

The need for wool for clothing to meet the Army estimate of 100 pounds of scoured wool for each man during his first year in service makes it a matter of grave concern to maintain and if possible increase the output of domestic wool, the only supply deliverable in quantity to our mills without undergoing the hazards of marine transportation. The requirement of 15,000,000 shearling pelts for lining aviators' coats exceeds the present supply. Lanolin, a byproduct of wool, is needed in quantity to insure the smooth operation of war machines.

In western Wyoming a livestock outfit lost 80 valuable range sheep to coyotes during January and February, but losses stopped after a

Service hunter took 42 coyotes. In Montana, a producer in Meagher County running 5,000 head of sheep reduced annual losses from 7 to less than 2 percent by organized predator control, and in Yellowstone County a Service hunter stopped losses by taking a female coyote which had killed 15 of 25 lambs in a short period. During February in Clatsop County, Oreg., the capture of a single crippled coyote, named Two-Toes, which was known to have killed 250 lambs and 40 sheep over a 3-year period, prevented further losses. The taking of 1 coyote charged with killing 125 sheep and goats during a short period in Garza County, Tex., ended the trouble, and losses were stopped in Garza County, Tex., by taking an old female wolf reported to have killed 50 lambs and 14 sheep.

Safeguarding Public Health

During the national emergency, greater attention must be given to the part played by rodents and predators in the dissemination of zoonotic diseases. Outbreaks of bubonic plague, rabies, typhus, infectious jaundice, and Rocky Mountain spotted fever, all of which are transmissible from wild animals to man or to livestock, have occurred, some of them near military areas; and the Service has worked closely with war agencies, the United States Public Health Service, State and local health units, and other cooperators to reduce the number of disease-carrying rodents and predators. Rat control was inaugurated at Fort Lupton, Colo., to overcome infectious jaundice, and in Miami and in Dade County, Fla., and New Orleans, La., in cooperation with city and county health departments, to suppress typhus fever; and in San Antonio, Tex., cooperative rat-control operations reduced the positive laboratory-tested cases of typhus from 80 to 1. During the spring, 30 people in southern New Mexico were required to take the Pasteur treatment for rabies, when an outbreak occurred among coyotes. Valuable livestock also were infected, but increased predator-control operations are being carried on in the hope of soon suppressing the disease. In Bryan County, Ga., Rocky Mountain spotted fever caused the death of an attending physician and one member of a family of six. Pocket gophers were found to be infected with the ticks that transmit the disease, and control measures were promptly applied. Experts from the Service have been commissioned in the Sanitary Corps of the Army to supervise rodent control on military areas. Systematic repressive work is being conducted in cooperation with the Gulf Coast Health Unit, which is responsible for work on epidemics in coastal parts of Texas. Control of ground squirrels in and around the army air base at Boise, Idaho, where bubonic plague was found by the Public Health Service, was continued.

Fishery Industries

Technological fishery investigations and broad statistical work are functions delegated to the Service by a Congress desirous of increasing, promoting, and developing an industry that although vast in ramifications and great in significance to the economy of the Nation is composed of units too diverse to carry out these essential functions for themselves. Thus, the fact-gathering facilities of the Service have been placed at the disposal of the commercial fishing industry both to their benefit and to that of the public. By developing orderly marketing procedures and more efficient methods of handling raw materials, conservation of fishery resources is promoted, the Nation's nutritional level is improved, and great quantities of foodstuffs are made available to meet wartime emergency conditions.

Fishery Exploratory Investigations

During the spring, the United States Government in cooperation with other American Republics and with the Government of the West Indies, undertook through this Service, an inquiry into the fisheries of the Caribbean Sea. Information thus far collected indicates that the fisheries in some localities can be materially extended. Undoubtedly new industries can be developed in the fishery resources of South America and the West Indies and areas not now visited by commercial fishermen can be made highly productive, developments that are particularly important in wartime. Such cooperative studies off the coast of neighboring Americas result not only in augmenting the total food supplies of the Americas, but also in strengthening general relationships among the American Republics.

Investigations to Improve Fishery Technology

In technological fishery work the Service is concerned chiefly with problems in the production, preservation, and utilization of fish products and byproducts. Investigational work conducted in the laboratories at College Park, Md., Seattle, Wash., Ketchikan, Alaska, and Mayaguez, P. R., made use of applied chemistry, bacteriology, and engineering in the improvement of current practices and the development of new methods and products.

War has created a multitude of new fishery problems and an increasing dependence upon scientific research for their solution. Previous technological work is now proving of direct value in increasing and extending fishery activities the better to meet present and future needs. When early in the war it became apparent that increasing disruptions in world trade were likely to develop short-

number of items necessary to public well-being that are derived principally from the fisheries, technological programs were revised to include investigations of possible new sources of these items or suitable substitutes. A partial substitute for imported agar was developed; empty bottles were shown to be desirable as substitutes for imported glass floats formerly used on subsurface gill nets; and it was found that a high quality poultry feed can be prepared from dogfish and shark carcasses—now discarded by the shark-liver fishery—thus supplementing the vital domestic supply of protein concentrates. For more efficient utilization of raw material in manufacturing fish meal and fish oil, additional information was obtained regarding the digestibility of fish proteins during the reduction process. Conversion of tarfishes and other oyster pests into substitutes for some of the materials that may not long be available is being studied.

Increasing demand for vitamin A for domestic consumption and for distribution under the lend-lease program directed greater attention toward possible new sources of raw materials, and caused data to be obtained regarding more efficient vitamin A recovery from existing supplies and studies to be undertaken to establish standards of quality. Increased Government buying of canned salmon, pilchards, sardines, and mackerel so reduced the supply for domestic needs that it was sought to develop new canned products from species not previously included in canning or considered of only limited utility. With the increased demand for dehydrated foods for transport abroad, attempts are being made to devise more efficient methods of dehydrating fish.

Investigations to Improve the Economics of Fisheries

Continued studies in fishery economics resulted in two published reports, one dealing with the retailing of fish in 56 cities in the Eastern States and the other with similar information on a regional basis for parts of the upper Ohio River Valley. In addition, brief studies were made with the object of providing necessary information to the Office of Price Administration, the War Production Board, and other emergency agencies and to the trade interests appearing before governmental bodies.

As war activities intensified, the drainage of manpower and vessels from the industry became more serious. Lowered production in combination with vast military and lend-lease purchases reduced civilian supplies of certain fishery commodities. The market development work of the Service was gradually reoriented to meet the situation. Of chief concern now are the encouragement of those fisheries most susceptible of stimulation under war conditions and a adjustment of fish consumption to meet new conditions of supply. The marketing of varieties not usually produced in large volume is

being encouraged and the public is shown how to make the most of them. Consumer information was aided by the establishment of defense councils under the auspices of the Office of Civilian Control and of information centers encouraged by the Office of War Relocation Administration.

The territories of field agents were enlarged, and agents were given new assignments to cover specific problem areas. More use was made of the heavy runs of Great Lakes smelt and herring which were related through work with producers, dealers, and consumers. Fish plant operators were shown how they could make fish more readily available in the Midwest by establishing contacts with producers, dealers and using their refrigeration facilities. Army purchases helped to get a variety of fishery products beyond that furnished by the more common species and to get the species favored by consumers from specific regions. Problems of obtaining adequate quantities and the desired methods of preparation also were solved. Fish plants and schools were helped to add variety to their cafeterias by greater use of fish. Efforts were made to facilitate the entry of canneries producing interdicted commodities into the fishery products.

Fishery Market News Service

From field offices of the Fishery Market News Service at New York, Boston, Chicago, Seattle, Jacksonville, and New Orleans, the latest available information on production and shipment of fish products and marketing data on supply, demand, and price is put out in daily mimeographed reports, telegraphic bulletins, and radio broadcasts to fishermen, shippers, wholesalers, buyers, and consumers. This market news service has been conducted long enough to build up a valuable backlog of fishery data and experienced personnel capable of meeting increased wartime demands.

In order that the fishery resources may be utilized to the maximum extent consistent with conservation, detailed periodic surveys of the most important markets are prepared. These and the daily releases on production and current prices furnish the War Relocation Administration with the data needed for regulating our food supplies with price and quantity controls. Thus, quickly recognized, surpluses may be removed and shortages remedied, and military purchase of fishing vessels may be based on the daily reports and the effects gaged almost as fast as the vessels are withdrawn from the fishing fleet. Since Pearl Harbor, military officers and mess sergeants have been placed on the daily reports lists in order that with a knowledge of market conditions they may request bids for sea foods, and suppliers are kept informed.

Army's requirements and Federal specifications. Former Federal specifications for fresh fish were revised to meet military needs and to conform more closely to current commercial practices. The first step in the direction of establishing standard Federal specifications for sea foods and in enabling purchasing officers to buy fish and fish more economically was the issuance of a Fresh and Frozen Fishery Products Reference Manual, a supplementary number of the Service's monthly periodical, Fishery Market News. The text is replete with tables and diagrams embracing information of paramount importance to the fishing industry as well as to the military service. It is intended primarily for use in procuring supplies of fishery products for the armed forces, it includes data on seasons of abundance, standard market forms, food and fuel values, edible portions, fat content, packing containers, methods of cooking, basic recipes, and related information.

Collection and Dissemination of Fishery Statistics

The collection of essential statistics relating to the yield of fishery products, the employment of men, craft, and gear, and the production of manufactured fishery commodities was continued, and new surveys were undertaken to provide specific current information required by military war-training agencies. With expanding civilian and military demands for fishery products for food and industrial uses and with increased demands placed upon these by lend-lease commitments, the commercial fisheries have been subjected to unusual strain. To help the industry fulfill its obligations, many statistical services have been developed in getting priorities, matériel, and Federal aid. A survey is in progress to learn the exact requirements of the fishery industry so that locations and priorities can be most efficiently determined and fishery production maintained. Data are being gathered upon fuel-oil requirements, and vessels operated and needed. This will guide, especially the War Production Board, the Navy Department, and the Office of Petroleum Coordinator for War in their respective fields. For use in the price-ceiling schedules the Office of Price Administration surveys were conducted to determine the production of vitamin A fish-liver oils for human consumption, the normal stocks on hand, and the sales, prices, and anticipated production. A similar survey on vitamin D oils for presentation to various war-planning agencies was made. Finally, the War Relocation Authority Board was supplied with statistical information on the effects of Japanese purchases of fishing vessels upon landings of fishery products.

being encouraged and the public is shown how to make the best use of them. Consumer information was aided by the establishment of defense councils under the auspices of the Office of Civilian Defense and of information centers encouraged by the Office of Price Administration.

The territories of field agents were enlarged, and agents were given roving assignments to cover specific problem areas. More effective use of the heavy runs of Great Lakes smelt and herring was stimulated through work with producers, dealers, and consumers. Locker-plant operators were shown how they could make fish more readily available in the Midwest by establishing contacts with producers and dealers and using their refrigeration facilities. Army purchasers were helped to get a variety of fishery products beyond that furnished by the more common species and to get the species favored by personnel from specific regions. Problems of obtaining adequate quantities and the desired methods of preparation also were solved. Industrial plants and schools were helped to add variety to their cafeteria menus by greater use of fish. Efforts were made to facilitate the conversion of canneries producing interdicted commodities into those canning fishery products.

Game Law Enforcement

Administration of Conservation Laws

The principal Federal wildlife-conservation statutes administered by the Service are (1) the Lacey Act; (2) the Migratory Bird Act; (3) the Migratory Bird Conservation Act; (4) the Mammal and Bird Hunting Stamp Act; (5) the black bass law; (6) a law protecting wildlife and property on Federal refuges (sec. 84, Criminal Code); and (7) through the Alaska Game Commission, the Alaska Game Law of 1925, as amended.

Amendments to the Migratory Bird Treaty Act regulations: canvasback and ruddy ducks from the list of species that were limited to 3 in the daily bag, legalized in 15 States the possession of a duck, prohibited the use of cattle, horses, or mules as blinds, and the weekly limit on geese in certain counties of North Carolina, California, and Illinois, closed the season on Wilson's snipe, and the mourning dove season to 42 days.

Work of Game-Management Agents

The 74 regular Federal game-law enforcement officers, singly and in cooperation with State agents and United States deputy game warden, obtained evidence in 2,892 cases of game-law violations. In State and Federal courts, these resulted in 2,711 convictions (see p. 5). By undercover operations under rules approved by the Secretary, and with an expenditure of \$599.89, game-management agents obtained evidence in 54 cases, 11 of which are pending; and in 11 already tried, fines of \$2,385 and jail sentences of 15 months were imposed.

Cases of violation of the Migratory Bird Treaty Act disposed of during the year, and cases still pending on June 30, 1942

<i>Disposition</i>	<i>Number</i>	<i>Pending</i>

Importations and Permits

war conditions caused a decrease in importations of birds and plants from 1,640 to 1,371, including 4 at Honolulu; and the number of shipments inspected from 250 to 154. Denied entry were 1 monkey from India, 2 crested mynas from China, and 2 bullfinches from Japan, which were destroyed or returned to the shippers. Birds imported, including 6,389 canaries, 100 parrots, and 37,490 Mexican quail, totaled 56,211, compared with 89,028 last year. Among animals imported were 6,024 Rhesus monkeys compared with 3,655 last year, 68 black bear cubs from Canada, 2 giant pandas from China, 8 gorillas from the Belgian Congo, 1 Chilean fox, and 1 vampire bats from the British West Indies.

Scientific collecting permits issued aggregated 320, bringing the total to 1,779. Scientific possession permits numbered 604, and 125 were issued to 132 individuals to possess specimens found dead. Hunting permits numbering 2,363 are in effect.

Propagation permits issued to possess migratory waterfowl numbered 258, and to take migratory waterfowl, 13; 632 propagating permits were canceled, and 3,716 are outstanding. Permittees reported existing in captivity of 3,101 wild geese and 76,072 wild ducks, of which 71,325 were mallards. Sale of propagated migratory waterfowl included 31,921 ducks and 329 geese for food, and 11,545 and 1,550 geese for propagation. Propagated birds liberated included 12,611 ducks, 234 geese, and 33 mourning doves.

Predation permits were issued in 758 instances to protect crops, and property, but only after investigation by game-management officials disclosed frightening devices to be ineffective. Other permits numbered 29 for taking birds and mammals in Alaska and 8 for taking fishes for bait from the waters in the District of Columbia.

Shore station and two whale catchers were licensed to capture whales along the California coast and to process them for which the wharves received a fee of \$1,000.

Alaska Fish and Wildlife

Fishery Laws and Regulations

Under the broad principles laid down in the act of June 1908 whereby the Department is vested with full authority and responsibility for regulating the time, place, and method of commercial fishing in Alaska, the Service continued its established program of protection and conservation of the fisheries to assure a sustained yield. The Director and other officials spent several weeks of territory giving attention to problems pertaining to management of aquatic resources. After the close of the fishing season, public hearings at which the Director presided were held at seven points in Alaska and at Seattle, Wash., to obtain recommendations and testimony regarding fishery regulations. Revised regulations were based upon the testimony presented at these hearings and upon investigations conducted by fishery biologists and law-enforcement officers of Alaska. Vigilant control over the fishery resources is necessary to prevent unwise exploitation in the period of national emergency when current market demands stimulate increased operations. The Department's regulations are meant to provide a sustained yield of fishery products; any prolonged emergency will not find the Nation lacking in fishery products.

In protecting the fishing grounds, 12 patrol vessels, 13 seaplanes and a number of other small powerboats, effectively supplemented Government-owned and chartered airplanes, were used. Personnel engaged in fishery protective work numbered 190, including management agents, stream guards, weir operators, vessel inspectors, and biologists. In addition, 11 wildlife agents of the Alaska Game Commission were deputized to assist.

Throughout the season, careful observations were made of the time and condition of the salmon runs and escapements, for guidance in modification of the regulations. Weirs for counting the escapement of spawning salmon were operated in 10 representative streams. Biological investigations concerning the salmon and hatcheries were continued.

Products of the Fisheries

The total output of Alaska fishery products in 1941 was 42,000 pounds, valued at \$63,439,593, compared with 323,507,000 pounds valued at \$36,441,000 in 1940. The estimated value of the products to the fishermen was about \$15,512,000, or about \$5,000,000 less than in 1940. The number of persons employed in the various branches of these fisheries increased from 25,199 in 1940 to 27,000 in 1941.

Salmon products represented about 83 percent of the weight and 92 percent of the value of Alaska fishery products in 1941. Canned salmon made up 93 percent of the output, the pack amounting to 6,932,040 cases, or 332,737,920 pounds, valued at \$56,217,601, an increase of about 37 percent in quantity and 79 percent in value over the 1940 pack. Red salmon comprised 17 percent and pink 67 percent of the total pack, as against 19 and 58 percent, respectively, in 1940. There were 109 canneries in operation, 9 more than in 1940, and the number of persons employed increased from 19,666 to 21,994.

In the herring industry, the number of operated plants dropped from 24 in 1940 to 13 in 1941. This decrease was due principally to the number of small plants closed in central and western Alaska and had little effect on the total production.

Halibut landings of the Alaska fleet decreased 5 percent in quantity but increased about 8 percent in value over 1940. Several of the minor fisheries made gains over the previous year, but there was a marked decline in the production of clams, shrimps, and crabs, owing chiefly to labor disputes and to the scarcity of labor.

Pribilof Fur Seals and Blue Foxes

Sealing on the Pribilof Islands and the incidental foxing operations were carried on by the natives under supervision of white employees. In all, 95,013 fur seal skins and 834 fox skins were obtained.

At the fur seal byproducts plant on St. Paul Island there were produced 35,000 gallons of No. 1 blubber oil; 19,610 gallons of No. 2 press, or carcass, oil; and 747,546 pounds of seal meal. All the meal and 39,610 gallons of oil were shipped to Seattle and sold through competitive bidding.

The annual supplies for the Pribilofs were shipped from Seattle on the U. S. S. *Spica*, through the cooperation of the Navy Department. The Coast Guard also cooperated in patrolling waters of the North Pacific Ocean and Bering Sea for the protection of fur seals and sea otters. The Service vessel *Penguin* made five round trips between Seattle and the Pribilofs, transporting supplies and personnel.

The Fur-Seal Treaty of 1911 expired on October 23, 1941, 1 year after formal notice of abrogation had been given by the Japanese Government. As the expiration was not until after the 1941 sealing season, both Canada and Japan normally would be entitled to the usual 15 percent of the season's take. Canada will receive her share, but in view of the existing state of war, the eventual disposition of the Japanese share has not been determined.

The estimated number of animals in the Pribilof Islands fur seal herd as of August 10, 1941, was 2,338,000 or 153,000 more than in 1940, an increase for the herd of about 7 percent.

Two public auctions of fur seal skins were held at St. Louis, Mo. In September 29,668 sold for \$1,363,310.50, including 8,246 dyed black, 8,701 safari brown, 12,075 matara brown, and 646 raw and partly processed; and in April 30,695 sold for \$985,839.75, including 6,101 dyed black, 10,387 safari brown, 13,848 matara brown, and 359 raw and partly processed. In addition, 2 sealskins were sold for \$105.11 at a special sale authorized by the Secretary. In all, 60,365 seal-skins were sold for the account of the Government for a total of \$2,349,254.96.

The care of blue foxes on the Pribilof Islands is incidental to sealing activities. Of the 834 fox skins taken, 182 were from St. Paul Island and 652 from St. George Island. There were sold at public auction 640 blue and 11 white fox skins taken on the islands in the 1940-41 season. The blue pelts brought \$11,634, and the white \$236.50, a total of \$11,870.50.

Japanese Activities in Bering Sea

A Japanese fishing fleet, comprising the floating plant *Kosei Maru* of Tokyo and 8 trawlers, also the *Tenyo Maru* and the *Sugura Maru*, and numerous small tenders, engaged in fishing operations in the Bering Sea in 1941. The fleet arrived off the northern coast of the Aleutian Islands in May, worked northward past the Pribilof Islands, and spent the greater part of the season fishing in the waters between the Pribilofs and Nunivak Island and elsewhere. The fleet withdrew from the Alaska coast sometime in July. Apparently the catch consisted chiefly of halibut and cod.

Enforcement of Alaska Game Law

The regulations approved for the 1942-43 season under the Alaska game law prohibit the taking of mountain sheep anywhere in Alaska, reduce the bag limits on deer and caribou, and generally shorten the open season on all game animals. On brown bear the bag limit was reduced to one in the Kodiak-Afognak Islands, and a closed season provided on the Alaska Peninsula west of Herendeen Bay. An open season on marten is allowed throughout the Territory, except on Prince of Wales, Baranof, and Chichagof Islands.

With the purchase of 2 more airplanes, the Commission now operates three 4-place and two 2-place planes based at Ketchikan, Anchorage, Dillingham, and Fairbanks, in addition to three salt-water patrol vessels, 4 river boats, 13 automobiles, and numerous outboard-motor craft.

Office of Indian Affairs

JOHN COLLIER, Commissioner

IT IS probably difficult for the average layman to understand why an agency such as the Indian Service becomes immediately and directly involved in the war. The Office of Indian Affairs has a wide range of responsibilities, covering almost every aspect of human living for a group of some 350,000 Indians in the United States and 33,000 natives of Alaska. In an all-out war these people are vitally affected. Indians who have heretofore lived in isolated areas on reservations suddenly find themselves part and parcel of the national war program. Their young men volunteer or are drafted. Both men and women enter war industries in large numbers. Blocks of their lands are requisitioned for cantonments and bombing ranges, and in the case of natives of the Aleutian Islands the war comes to their very door steps. Consequently, the Indian Service finds itself devoting much of its time and effort to problems arising directly from the war.

Indian Service Administers War Relocation Center

One of the major war connected tasks of the Service had to do with the evacuation and relocation of Japanese from the West coast. Even before the creation of the War Relocation Authority, the assistance of the Indian Service was sought in the handling of this problem. Within a few days after the creation of the WRA arrangements had been made to utilize a portion of the Colorado River Indian Reservation in western Arizona, upon which to locate some 20,000 evacuees. This project, the largest of all the centers established to handle evacuees, is being administered entirely by the Indian Service under an agreement with the War Relocation Authority.

There are approximately 1,200 Mojave and Chemehuevi Indians living at the northern end of the reservation. They have irrigated and cultivated some 8,000 acres of land by pumping water from the Colorado River. Several years ago the Indian Service planned the

subjugation of approximately 100,000 acres of land within the boundaries of this reservation lying along the eastern bank of the Colorado. Inasmuch as the resident Indians could use not more than 15,000 or 20,000 acres, it was planned over a period of approximately 15 years to colonize on the newly developed land Indians from other reservations, such as the Navajo, Hopi, and Papago, where land resources are utterly inadequate to meet the needs of the existing population. In 1942, the Indian Service completed the construction of a diversion dam across the river. In May, the main canal from the dam was connected with the irrigation system used by the Indians, substituting gravity water for the water previously pumped.

Several miles to the south of the land occupied by the Indians the War Department has built three communities for evacuees. The first accommodates 10,000 colonists and each of the other two accommodates 5,000. A ditch from the Indian irrigation system to the relocation center delivers water to the communities in order to provide for the planting of grass and shrubs around their homes. The colonists are clearing and leveling land in the vicinity of the communities and crops soon will be planted to aid in their own subsistence. Eventually it is expected that they will clear, level, and irrigate 25,000 acres, planting this with subsistence crops. After the war the evacuees will be removed from the reservation and these newly developed lands will be used by members of the Colorado River tribe, and of other tribes to be colonized there.

The War Department, under contract, built the communities, but upon completion, moved out and turned them over to the Indian Service to administer. The Service found it necessary to transfer many of its best personnel to the project in order to get it under way promptly. The superintendent of the Papago Reservation was detailed to become the director of the project and the superintendent of the Truxton Canyon Reservation was detailed as his associate. Many other employees of the Service were detailed to various types of work within the project.

One of the major problems was to provide necessary school facilities for the 6,000 children of the colonists. These schools had to be designed, built, equipped, and staffed between the first of July and the opening of the school term. The colonists themselves aided in the construction.

These buildings were constructed of adobe, thus making the maximum use of the labor of the colonists, both skilled and unskilled. Buildings of this type are more useful in the hot climate.

The difficulty of securing adequate medical personnel and the delay in the completion of the hospital units placed increased burdens upon the project staff. Furthermore, the lack of adequate medical facilities caused considerable anxiety and insecurity among the colonists.

ously, the problems of 20,000 people living under most adverse conditions are very acute. These were further complicated by the uncertainty of the future and the tremendous shock incident to their being uprooted, and moved from their homes into a new and utterly different life. In spite of these conditions, the rate of sickness has gradually declined.

The experience of the Indian Service with a minority group over 17 years is proving invaluable in the administration of the Center. With both the Indians and the evacuees the major objective is to help functioning local democracies. The colonists have elected a representative government. Local courts and all aspects of municipal government have either been formed or are in process of formation. Smith's intensive training in the principles and procedures of cooperatives was arranged in response to the request of the colonists that sports, amusements, and personal services of all types, be conducted on a cooperative basis. In cooperation with the Friends Service Committee and St. Johns' College a program of adult education has been initiated. Other types of adult education are also planned. Freedom of liberty of speech and assembly is granted the colonists.

Relocation Center on Gila River Reservation

On the Gila River Reservation, in southern Arizona, an additional 100 evacuees are being placed. Here the War Relocation Authority is leasing 7,000 acres of land which the Indians have held in a large communal tract and which they have operated for cash income in order to take care of their irrigation costs. On these lands the colonists plant crops for subsistence. They will clear and level an adjacent 100-acre tract and construct laterals and bring this land under irrigation. Upon the termination of the war this improved land will revert to Indian use. Many of the Indians are employed upon community construction at these two centers.

Japanese Invade Aleutian Homes

Prior to the attack on Dutch Harbor, plans were being developed in cooperation with the Naval authorities for the possible evacuation of the Aleutians. Immediately after the attack these plans were put into effect and all of the natives of the islands west of Dutch Harbor were evacuated to the mainland. It became necessary for the Indian Service, in cooperation with other agencies, to make arrangements for the relocation of these evacuees, to house them, to provide necessary food and medical care, and to plan for their future self-support. Many of the Indian Service teachers in Alaska are licensed radio operators under the Federal Communications Commission, and their

responsibilities for maintaining communication with the authorities as well as for looking after the welfare of the Indians and Eskimos are of prime importance during wartime.

Indian Service Hospital at Unalaska Bombed

Across the narrow bay from Dutch Harbor lies the little town of Unalaska. In the bombing of Dutch Harbor, one bomber sacrificed itself from the squadron and devoted its efforts to the destruction of buildings at Unalaska and the machine gunning of citizen streets. The Indian Service hospital was struck and partially destroyed. The civilian defense organization had functioned perfectly and every patient, nurse, and physician had been removed to sheltered quarters.

Enemy Attack Expected

Since the outbreak of war, Alaska's Indians and Eskimos, totaling 50 percent of the peacetime population, have expected enemy attack, and are prepared to meet it. The United States forces in Alaska contain a number of natives, whose special training is of inestimable value. Alaskan natives are accustomed to all day on snowshoes, are skilled in the use of rifles and knives, have first-hand knowledge of the geographic and climatic conditions of the Arctic region, and are accustomed to its peculiar temperatures. These are factors of prime importance in territorial defense.

The full support of Alaskan natives to the United States Government is manifested by their eagerness to enlist in the armed forces and by their generous purchases of war bonds. The largest purchase of war bonds in the Territory for the month of December came from Indians and Eskimos, who presented Gov. Ernest Gruening with a check for \$110,645.72.

A few days after the outbreak of war, Alaska organized an organized civilian defense program.

There is much yet to be told of the courageous work of the Alaska National Guard Service men and women and the inspiring role of the Alaska natives in defending their homes and giving their lives in the war for freedom.

Indian Lands Used for Army Purposes

Many requests for use of Indian lands and other facilities for a variety of purposes were made during the year by both the Army and the Navy.

For example, the enlargement of a camp and the establishment adjacent to it of a large bombing range necessitated the almost

removal of some 50 Indian families located in the area. It was necessary to purchase additional land for them, to provide housing to rehabilitate these families in new locations. Almost at the same time the demand of the War Department for an aerial gunnery range necessitated the removal of more than a hundred families to another part of an Indian reservation. There is little tribal land on this reservation; most of it is individually owned or held by allottees and their heirs under restricted or trust title. Therefore, it was necessary to purchase land for these families and to provide them with the necessary livestock to make themselves self-supporting in their new location. The Metlakhatlans in Alaska made part of an island available to armed forces.

The Attitude of Indians Toward the War

One would expect the Indians of the United States to be confused and perplexed by the war situation. Essentially they are a rural people. Many of them live in remote areas, speak only their native languages, and have little access to newspapers, radio, or other forms of communication. How could they be expected to understand the intricacies of ideologies which has precipitated the world crisis?

Moreover the treatment which the Indians received at the hands of the Federal Government during the past century and a half might very well have alienated their sympathy and loyalty and left them disgusted in the Nation's welfare and unwilling to defend it against its enemies.

From the very beginning, official attitude toward the Indians was largely one of intolerance and repression. They lost much of their land through forced treaties and were pushed back onto reservations which the Government promised to preserve. Treaties were broken, promises pledged ignored, and more and more of their land taken from them.

Finally through the forced allotment of many of the reservations much of their remaining land was lost to them and their social organization destroyed and their tribal culture driven under cover.

This "liquidation of the Indian" was accomplished by the destruction of his ways of earning a livelihood, by the wiping out of the buffalo, the Indian wars in which the slogan was that the only good Indian was a dead Indian, and by a vigorous campaign of education and regulation to stifle Indian languages, arts, and ceremonials.

Although Federal policies for the past 12 years have been completely reversed, Indians are still experiencing discrimination on every hand. In at least three States Indians are still refused the right to vote. They are often discriminated against in industrial

employment; are the last to be taken on the job and the first to be let off. In many areas even where they are permitted to live have been in a large measure debarred from participation in the life of white communities. How, one might ask, could they be expected enthusiastically to take up arms in the defense of the white community which has treated them in this fashion?

Strange as it may seem the Indians have responded eagerly and even enthusiastically to the challenge of the war. From the remote parts of isolated reservations has come evidence of Indian participation over the war. More than once an Indian, or a group of Indians, has shown up at agency headquarters, each man with his gun, to register for selective service and to proceed immediately to the front of fighting. Prior to the Japanese assault at Pearl Harbor the Indian in the Army alone numbered 4,481, of whom approximately 50 per cent had enlisted either in the Regular Army or the National Guard. The rate of enlistment increased very substantially since the outbreak of war, until on June 1, 1942, more than 7,500 Indians were in the armed forces. While this seems relatively a small number it represents a larger proportion than any other element of our population.

Of record in Washington are purchases of \$1,270,000 in war bonds from April 1, 1941, to March 1, 1942. Additional purchases aggregated approximately \$750,000.

The Crow Tribe of Montana offered the Government its own resources and all of its manpower. Even the girls and women were tempted to enter active military service.

The California Indians, especially, have been at odds with the Federal Government since 1850, and yet the Mission Indian Legion, with 3,000 members from 30 reservations telegraphed President Roosevelt and Governor Olson "a message of loyalty and resolve to serve our great Nation."

Indians are serving in almost every corner of the world. American forces are in action. Large numbers were killed. Occasionally individuals are singled out for honors. The first Indian soldier thus far has been the late Maj. Gen. Clarence C. Roberts, an enrolled member of the Osage tribe, who was lost in the attack on Midway. Major General Tinker was placed in command of the Hawaiian Air Force shortly after Pearl Harbor. In the attack on Midway he selected himself to lead a bomber attack on the Japanese navy. Flyers in the same formation with General Tinker were shot down; that his plane was last seen descending rapidly into the sea. Although a careful search was made of the area, no trace was found of the bomber or its occupants.

Lt. Gen. Delos C. Emmons, Military Governor of Hawaii, in the command of the Hawaiian Department, praised General Tinker's

y and skill in a statement which he issued shortly after the Air
Commander was reported missing. General Emmons said:

The entire Hawaiian Department mourns the loss of Major General
er and his gallant crew.

Because General Tinker would not ask his subordinates to under-
take risks he himself would not take, he selected himself as flight
leader of an important combat mission requiring great courage, skill,
and experience.

He died knowing that he had had an important part in winning a
victory. His leadership was an inspiration to his command and
his loss is a deep personal one."

It may not be too great a stretch of the imagination to suggest that
Indians have identified the struggle of democracies the world over
with their own struggle of the last century. It may be that they see
the victory of the democracies a guarantee that they too shall be
permitted to live their own lives. Perhaps their experiences of the
10 years in which there has been a rebirth of spirit, a reviving of
smoldering fires of local democracy, and a step toward economic
stabilization have helped them to see the possibilities in a world of
"Four Freedoms."

A few instances lifted from the official record will serve to show
something of the spirit with which they approach the world crisis:

Immediately after Pearl Harbor, the Indians of the little village of
Santa Ana in New Mexico left their homes and went secretly to their
sacred shrine. There in their former home, long since abandoned,
the entire Pueblo remained for one unbroken month in secret prayer.
Their prayers were for the people of all the world. News of the pil-
grimage became known only when the Indians sent word to the author-
ities that they intended to build a great fire at the conclusion of their
pilgrimage. They wanted the Army to know that this was a sacra-
mental fire and not the result of sabotage or overt enemy action.

The Pueblo of Zia, also a little village in New Mexico, engaged in
it before the second selective service registration. In the Pueblo
of Santa Ana in New Mexico the Red Cross drive was announced from the
beginnings and the canvassing started in a blinding snowstorm. Each
household contributed wheat, corn, or hay, or whatever there might
be available. One family donated \$6 and two rings.

The great Navajo Tribe, numbering some 50,000, was so stirred by
the country's declaration of war that its tribal council laid aside its
business and spent almost an entire day in patriotic demon-
strations, plying the superintendent with questions about the flag
and its meaning, questions as to how the Navajo Tribe could best
contribute to the prosecution of the war. Even the old people were
determined that they be allowed to enlist and the action of the Selective
Service officials in turning down many young Navajos because of their

inability to read and write or speak the English language has been felt very keenly by the entire tribe.

There is some evidence among the Indians of confusion over their legal obligations and responsibilities under the Selective Service Act. During the last war most of the Indians in the United States were not citizens, and were, therefore, declared not to be subject to conscription. Only those few who were citizens were required to register. A very large number volunteered, however, and made an enviable record.

In 1924, Congress passed an act which conferred citizenship upon all Indians born in the United States who had not already acquired such citizenship. The courts have now held that by virtue of this conferring of citizenship the Selective Service Act is applicable to all Indians. That they should be exempted in one war and drafted in the second has created some confusion. It has been necessary for agency officials patiently to explain and to interpret.

The unique legal status of Indian tribes as separate political communities has further confused some of the Indians with regard to their status under the Selective Service Act. Indian tribes have many inherent powers—far more than the average municipality. They possess all of the powers of a sovereign nation except those specifically infringed by acts of Congress or by treaties. Several tribes, conscious of these powers of self-government, have made declarations of war upon the Axis Powers. Notable in this regard was the action of the Six Nations of the Iroquois confederacy. Delegates of this historic government, representing the 6,000 Indians who reside on eight reservations in New York State, came to Washington early in June to present to the President and to the Congress their formal declaration of war against the Axis Powers.

Indians in Wartime Industry and Agriculture

The Indians are playing an important role in the agricultural and industrial production program of the war. Skilled Indian workers are to be found scattered throughout important war industries in almost every section of the country. They are doing highly technical jobs in aircraft industries on the West coast, in Kansas, and in New York State. They are to be found among the crews constructing bases in far-flung parts of the world. They are handling skilled jobs of every description—welding steel, operating jack hammers, and handling some of the most difficult machine operations. Under the program of the Indian Service during the past 10 years thousands of Indians were employed in the building of truck trails, look-out towers, highways, and soil conservation structures. They demonstrated

marked ability to learn to operate heavy machinery of all kinds. Hundreds of other young Indians were trained in Indian schools in sheet metal, welding, auto mechanics, radio maintenance, and other industrial trades and are now employing their skills in airplane plants, tank factories, and shipyards.

Indians Grow Food for Freedom

Reports coming to the Indian Office indicate that there has been a 15-percent increase in the number of gardens planted by Indians this year and a 35-percent increase in acreage. Field crops are reported 18 percent greater and the spring pig crop 25 percent greater than last year. Indian livestock increased by 35 percent during the first 6 months of this year and sheep by 50 percent.

Every acre of grazing land not essential to Indian operation is being made available for permittees.

The unsettled conditions in Alaska make uncertain at the moment the output of the canneries operated by Indians. They have been urged to make every effort to increase their packs, but the availability of transportation and cans will partially determine the success of these efforts.

The Indians of the Red Lake Reservation expect to market a million pounds of fresh fish during the present season.

Timber Production

In connection with timber production, the Office recently approved a sale of spruce on the Quinault Reservation for airplane production. A contract has been let on the Warm Springs Reservation for one-half billion feet of lumber. There is under consideration a contract for one-half billion feet each on the Yakima and Colville Reservations. Lumber amounting to 400 million feet on the Fort Apache Reservation and 150 million feet on the Klamath Reservation is available if scalers can be found to help get timber out of the forests. In each instance the maximum cut allowable under sustained-yield operation is being permitted.

Last year approximately 600 million feet of timber were cut from Indian reservations. It is expected that this will be materially increased this year.

In addition to the regular funds, \$140,000 have been placed in Arizona, California, and Washington for the employment of lookouts and guards to protect Indian forests. One hundred and thirty towers are now manned.

Indian Service Assists Other Countries

The work of the Indian Service during the past year literally extended to the four corners of the world. For example, the Government of Saudi Arabia learned of some of the small-scale irrigation developments among the Indians of the Southwest and the King personally requested assistance in developing similar facilities among the people of that country. The Palestine Economic Corporation asked the Office of Indian Affairs for recommendations and help in the development of similar work in Palestine.

At the request of the Rosenwald Foundation, studies were made of Indian education in Peru, Ecuador, and Bolivia, and assistance given educational officials in those countries in the development of a program of Indian education.

Active assistance was rendered the Ecuadorian Economic Survey Mission, formed by the Office of Foreign Agricultural Relations of the Department of Agriculture, upon request of the Coordinator of the Office of Inter-American Affairs, to study the possibilities of improving and increasing the production of sheep and wool in Ecuador. Service officials assisted the Haitian Government in developing its rural school program. This service was requested by the Haitian Government and the Department of State.

Other activities included a study of Indian administration in the various Latin American republics, assistance in developing collaboration among the several governments which have large Indian populations, and surveys in South America in behalf of the Coordinator of Inter-American Affairs, in the interests of the popular arts.

Indian CCC Leaves Outstanding Record

The fiscal year 1942 marked the ninth year of conservation work by Indian enrollees of CCC and concluded a unique chapter in the annals of Indian Service. The original objectives of CCC-Indian division were to provide employment and vocational training for Indians who were in need of work. Actual accomplishments far surpassed those initial aims.

Conservation structures to check the destructive erosion of lands now protect the forests, range, and forage cover on Indian reservation lands and adjacent areas. Thousands of miles of truck trails reach into Indian forests and range lands. Telephone lines, fences, and firebreaks aid in the efficient protection and use of forests and ranges. Fences alone, built by Indian enrollees, measure 12,537 miles—more than half the circumference of the earth.

More than 75,000 different Indians had a part in the CCC program. Vocational training was provided in 55 different occupations. Eight

and Indians earned the rating of skilled workmen. Forty thousand were classed as semi-skilled in job performance.

Approximately 6,500 former Indian enrollees are now in the armed

The skills and safety habits acquired through their CCC jobs in truck driving, tractor operation, radio and telephone mechanics, motive repairs, jack-hammer operation, handling of explosives, fighting, and the like, will prove of inestimable value to the nation.

Others are employed in airplane factories, in shipyards, in munition manufacturing plants, on highway construction. Among them are welders, riveters, engineers, tractor operators, metal workers, carpenters, and masons.

Indian Schools Adapt Curricula to War Training

Indian schools of the Indian Service naturally have been affected by war preparations for war and by the program of war training. Many older boys have entered the armed forces of the country and many of the men teachers have accompanied them. In the Indian schools located near war industries, the remaining students have been rapidly absorbed into such employment as soon as they reached an employable age and have had a minimum of skilled training. On the West Coast, employment opportunities in aircraft factories and shipyards have been opened to young women and classes in machine-shop practice and welding for girls have been provided for the Indian Service. This trend toward female employment is being carefully watched and similar classes will be opened in other Indian Service schools as the demand arises. Most of these high schools have operated on a 6-day week, 12-month basis, to speed up training of students and provide for the training of an increased number. Older men have been welcomed in these schools for retraining or brush-up work preparatory to entering the war industries.

The Wingate Vocational High School on the Navajo Reservation has undertaken special pre-enlistment training for young Navajo men to correct their use of English, give them necessary preliminary health examination, and the elements of preliminary military training which will ease their induction into the armed forces and compensate for lack of earlier education. The war is resulting in additional emphasis on the program of native language work for it is through the use of written Navajo particularly that the older non-English-speaking Indians are receiving instruction in war aims and objectives, with regard to civilian activities which contribute to the war effort.

On the reservation Indian schools have taken the leadership in repair and maintenance of automotive equipment, farm machinery, and

other similar activities making their shops available for use by adult Indians in cooperation with the Extension Division and CCC project leaders. School gardens have been greatly increased and school personnel has cooperated closely with the Extension Division in encouraging the increase of Indian community gardens.

The rubber shortage has reduced the use of school buses, and in a number of instances riding horses or horse-drawn vehicles have been substituted. The Education Division's program of breeding Morgan horses initiated several years ago at Pine Ridge, Rosebud, Tongue River, Carson, and Chilocco has laid the foundation for the replacement by horses of much automotive equipment. The success of the program has led to the introduction of horse breeding on other reservations. This activity may contribute directly to the war program in other areas by supplying well-bred horses for military and civilian use outside the Indian Service.

Cooperation with the Department of Agriculture in the development of community size dehydrating plants has resulted in the production of a very useful unit built largely of second-hand material, which has made possible the quick drying of many types of fruits, vegetables, and meats. These experiments have been conducted at Phoenix Indian School and hundreds of tons of this summer's crop of surplus food products have been dried and are available for use in Indian schools in the United States and Alaska. Additional units are being built for use in other areas of the Service. This is only a portent of the potentialities of dehydration not only for the Indian Service, but for commercial production.

Tribal Government in the War Crisis

These war years perforce will hasten the maturing of tribal self-government. With appropriations reduced, with personnel drawn off into military service and war industries, and with the Federal Government concentrating its resources on the prosecution of the war, the Indian tribes will find it expedient and perhaps necessary to make ingenious use of their powers of self-government. Some few tribes may fail for lack of leadership or because of peculiar handicaps, but for the great number it will be a time of challenge and of growing into maturity. Under normal conditions this growth might have been reached through years of hesitant groping. Now, faced by crisis, there is no choice.

The ground is well prepared for this testing. The tribal governments which have been fostered since June 18, 1934, the date of the passage of the Indian Reorganization Act, are survivals of tribal governments which existed even before the founding of the American Republic. Were they the recent creations of a federal government

only granting local home rule to Indian groups there could be expectation of survival for them during the months ahead. the rooting is deep. The powers of self-government possessed Indian tribes are not derived from the Indian Reorganization Act. act is largely a recognition of the inherent powers of self-government, which the tribes have always possessed and is the means of making such tribal government effectively to function.

From the earliest years of the Republic, the Indian tribes have been recognized as distinct and separate political communities, qualified to exercise powers of self-government, not by virtue of any delegation of powers from the Federal Government but rather by reason of their national tribal sovereignty. The public usually thinks of Indians as wards of the Federal Government, which exercises over them individually the kind of power and protection usually exercised by a guardian over a minor. Many people, otherwise familiar with Indian affairs, do not realize that Indian tribes are legal entities, subject to Federal law to the exclusion of State law, and entitled to exercise their inherent rights of self-government so far as is consistent with Federal law. An Indian tribe possesses all powers of a sovereign State except those which have been specifically taken away from it either by treaty or by act of Congress. Tribes are subject to the legislative authority of the United States, that is to the Congress. Tribes are not subject to State laws except where Congressional action has so decreed.

While the Congress and administrative officials have in numerous instances frustrated the exercise of tribal powers, the courts have steadfastly upheld them. And while these powers have been restricted somewhat by treaties and acts of Congress there still remains for the Indian tribes a large area in which the inherent powers of self-government may function. A tribe may determine its own membership, regulate domestic relations, control the distribution of the property of its members in the absence of contrary legislation, administer justice in connection with every offense not specifically made a Federal offense, and exercise many other rights and powers.

It is well to call attention at this time to the relationship of Indian tribes to State and Federal government in view of the considerable attention now being given in this country to problems of colonial administration likely to be encountered after the war. The Indians represent conquered nations but nations whose rights are being protected by the highest courts in the land. However much the Federal Indian Service may suffer for lack of appropriated money or of qualified personnel, Indian tribal government should suffer no loss of effectiveness. On the contrary this should be a time of structural growth against the future.

Tribes Invest Their Money in Land

One certain indication of the growing earnestness with which Indian Tribes are facing the task of providing for the future is to be seen in their willingness to invest their own tribal monies in land. This trend started several years ago and continues at a quickening pace. Among the tribes using their funds for land purchases are the Navajo tribe of New Mexico and Arizona; the Confederated Bands of Utes, Utah; the Round Valley Reservation, California; and Colville Reservation, Washington; the Flathead Indians, Montana; the Omaha Reservation, Nebraska; the Spokane Indians, Washington; the Chippewa of the Consolidated Chippewa jurisdiction in Minnesota; the Warm Springs Reservation in Oregon, and the Cheyenne River Reservation in South Dakota. The Flathead tribe, which receives a sizeable annual revenue from a power site lease, is in the midst of developing a long-term program which contemplates land purchase, the resettlement of landless members, and investment in livestock and farming equipment. A similar opportunity confronts the Blackfeet Tribe in the same State. Here royalties derived from oil deposits in tribal land are being converted into the resources and tools required for an extensive program of tribal and individual rehabilitation.

Lands in Heirship

Absence of an adequate land base is not the only handicap which some tribes face. In the Sioux area of North and South Dakota there is abundant land, but unfortunately a great part of it, in the case of one or two reservations the greater part of it, remains in Indian possession and yet is lost to effective Indian use through inheritance possession; ownership has become divided among so many and so widely scattered heirs that control is lost and the Indian Service is burdened with a costly and unproductive real estate agency. This situation has existed for a number of years. The Indian Service has made little headway in improving the situation though it has been a subject of constant discussion during the past decade. The most encouraging development of these last 10 years is the interest which the Sioux Indians themselves are now taking in the problem. During the fall of 1941 meetings were held with Indians on several of the Sioux reservations, followed by a general conference for the purpose of summarizing observations and recommendations. Indians eagerly participated in these conferences and contributed some of the most searching and constructive thinking. The Cheyenne River Tribe has already taken the lead in formulating a code of land management aimed at establishing procedures for consolidating scattered individual and tribal holdings. It has long been realized that this baffling

em will not be remedied until the Indians concern themselves t. From the beginnings now being made in the Sioux country possible that the first real advance toward the solution of this lemma will be made.

Tribes Maintain Their Own Courts and Police

still another important area of social action Indian tribes are oping the type of autonomous action which is latent in the s residing in them. This is in the field of law and order, do- c relations, and the conduct of members. Maintaining law and among upwards of 350,000 Indians living on 174 reservations ever been a simple task. Offenses committed by Indians against ns on Indian reservations are not usually subject to the juris- n of the State courts. Only 10 major offenses are subject to urisdiction of the Federal courts. Other offenses must be led by the Indians themselves through their own courts. To add e difficulty there has been a serious reduction in law enforcement nnel. The Indian tribes have met the situation seriously and ively. Out of all the Indian tribal courts and Indian enforce- machinery now operating, there have been remarkably few laints of injudicious action or of failure of the tribal machinery. mparative study of the effectiveness of this tribal adjudication courts operating in non-Indian communities would probably inate interestingly the essential law abidingness of the Indian e and the high level of judicious practice. In the allotted where Indians and non-Indians live side by side the enforcement v and order through tribal courts is often more difficult. ie Planning and Development Branch has especially emphasized ecessity of having tribal councils and Indian communities plan , more effective utilization of their social and economic assets. umerous conferences have been held in the field with Indian Service nnel and members of Indian councils relative to the formulation ans for the establishment of planning committees and the develop- of social and economic programs for communities and reserva- . Functioning planning organizations have been established on Warm Springs, Flathead, Fort Belknap, Rosebud and other vations.

Victory for the Walapai Tribe

1 December 8, 1941, the Indians won an important victory in Supreme Court of the United States. A unanimous decision ns the possessory right of the Walapai Indians to lands which have occupied from time immemorial although these lands had

been granted by the Congress of the United States to the Santa Fe Railroad prior to the establishment of the reservation.

In 1923, the Santa Fe Railroad, claiming about half of the lands of the Walapai Reservation under a railway grant act, asked that the reservation be divided into two equal parts, one of which would henceforth be the absolute property of the railroad.

Case Lost in Two Courts

Six years ago, the Department of Justice commenced a suit to establish the continuing Indian right of occupancy to the whole reservation and, its right to such other areas as still might rest under an unextinguished right of occupancy. The case was lost in the United States District Court of Arizona, and again in the United States Circuit Court of Appeals. The Solicitor of the Interior Department, upon invitation of the Department of Justice undertook to make a final effort to have the Supreme Court review and reverse the decision of the lower courts.

The Supreme Court granted the petition for a review of the case by certiorari. The case was argued on November 13 and 14.

The Circuit Court of Appeals had held that Indians in this area are in an inferior legal status to Indians in other areas, because of supposed discriminations under Spanish and Mexican law. This position was vigorously rejected by the Supreme Court, which declared that the rules laid down in earlier opinions guaranteeing respect for aboriginal occupancy of tribes under former Spanish dominion had "been so often and so long repeated as respects land under the prior sovereignty of the various European nations, including Spain, that like other rules governing titles to property they should now be considered no longer open."

Supreme Court Reaffirms Marshall Doctrine

It was argued also that since the land claims of the Walapai Tribe had never been recognized by the Federal Government either in a treaty or in any other formal action, the tribe could not show any rights superior to those of the railroad. In rejecting this contention the Supreme Court reaffirmed the doctrine of Chief Justice Marshall that the Indian tribes are "distinct political communities, having territorial boundaries, within which their authority is exclusive, and having a right to all the lands within those boundaries, which is not only acknowledged, but guaranteed by the United States." Accordingly, the Court said, the fact that a right of occupancy finds no formal recognition is not conclusive.

A third question of general interest considered in the Supreme

Court's opinion, written by Mr. Justice Douglas, was whether forcible removal of Indians from their ancestral homeland terminates their possessory rights in lands which they have occupied from time immemorial. The Supreme Court held that where such removal is not based upon Indian consent, there is no forfeiture of rights. Referring to the military removal of the Walapai Tribe, the Court said:

Their forcible removal in 1874 was not pursuant to any mandate of Congress. It was a high-handed endeavor to wrest from these Indians lands which Congress had never declared forfeited. No forfeiture can be predicated on an unauthorized attempt to effect a forcible settlement on the reservation, unless we are to be insensitive to the high standards for fair dealing in light of which laws dealing with Indian rights have long been read.

The case was remanded to the courts below to secure an accounting to the Walapai with respect to income heretofore derived by the railroad from lands legally subject to Indian occupancy.

Supreme Court Upholds Indians' Fishing Rights

In another significant decision the Supreme Court on March 30, 1942, held that the State of Washington is without power to charge the Yakimas a fee for fishing in their usual and accustomed places.

Sampson Tulee, a member of the Yakima Tribe, was convicted in the Superior Court for Klickitat County, Wash., on a charge of catching salmon without first having obtained a State license. This conviction was upheld by the Supreme Court of the State of Washington.

In 1855, the Yakimas were occupying lands which the United States wished to open up for settlers. Representatives of the Government met with representatives of the Indians and negotiated a treaty under which the Indians ceded a large amount of land.

Article III of this treaty secured to the Indians the exclusive right of taking fish in streams running through or bordering the reservation and also the right to take fish at all usual and accustomed places in common with the citizens of the territory.

Relying upon its powers to conserve game and fish within its borders the State asserted that its right to regulate fishing might be exercised at places not within the boundaries of the reservation. The appellant, on the other hand, claimed that the treaty gave him the right to fish in the "usual and accustomed places" free from State regulations of any kind.

The Supreme Court decision upholds the right of the Yakimas to fish in such areas without having to pay the State license. The decision, however, makes it clear that the State does have a right to regulate the taking of game and fish but holds that the imposition of license fees is not indispensable to the effectiveness of a State conservation program.

Menominees Win Court Award in Swamplands

When the United States, in 1854, under treaty with the Menominee Indians, set aside the present reservation, the Menominees were left with lands which 4 years before had been granted to the State of Wisconsin as "swamplands."

The Court of Claims during the past year decided that the Menominees were entitled to these lands and handed down an opinion opening the way to the recovery of the lands from the State of Wisconsin. If this opinion is not upset by the Supreme Court, it will be the final solution of a problem which has vexed the Indians and Indian administration for many years. These swamplands are scattered over the reservation—small islands of land, within the reservation, the title to which was in dispute. With the purchase of these the entire reservation and its timber will belong to the Menominee Tribe.

This reservation has one of the finest stands of hemlock and spruce woods in the entire Lake States. It has not been cut over and covers most of the area. The Menominees operate a lumber mill on the timber of the reservation on a sustained yield basis.

A Vital Opinion on the Fishing Rights of Alaskan Natives

The fishing industry is the largest and most important source of income and of employment for the natives of Alaska.

Originally the natives of the Territory had access to many fishing areas. Under Indian custom certain families or tribes were recognized as owners of these areas. From time immemorial, they possessed hereditary exclusive rights to these sites. The white men came to Alaska and established fishing traps and salmon canneries, and began to encroach upon and to establish fishing sites where the Indians had formerly been fishing.

After the Supreme Court handed down the *Walapai* decision, the Solicitor of the Interior was asked to give an opinion as to whether the rights of the Indians of Alaska did not have aboriginal fishing rights according to the principles set forth by the Court in the *Walapai* case, were being violated. The Solicitor's opinion of February 1942, was in the affirmative.

After citing numerous court decisions upholding the possessory rights of Indians in lands and water where such rights have been extinguished by any treaty, statute, or administrative action, the Solicitor concluded that "Available evidence indicates that the possessory rights traditionally asserted by Alaskan natives in

clusive rights, under which the right to exclude others from a given area is an integral part of the right in itself. In this situation the Interior Department would have no authority to open up to public fishing any areas subject to such possessory rights, any more than it could open to the public a private cannery, whether on land or afloat."

It becomes necessary, under the opinion of the Solicitor, for the natives to establish the fact of continued occupancy.

National Indian Institute Formally Created

The report of the Department for 1941 announced the ratification by the United States Senate on May 26, 1941, of the international convention creating the Inter-American Indian Institute. This institute was formally created on March 25, 1942. On that date the representatives of the adhering nations met in Mexico City, organized the Governing Board, and selected Mexico City as the permanent site of the Institute. Commissioner Collier was selected president of the board. This organization is the official agency for the development of collaboration among the American nations on matters affecting the more than 30,000,000 Indians who live in the Western Hemisphere.

Article X of the Convention stipulates that each ratifying nation shall establish a National Indian Institute to serve as an affiliate of the Inter-American organization. Pursuant to the provisions of this article, President Roosevelt, by Executive order, on November 1, 1941, established an Institute to serve the United States.

The National Indian Institute will perform within the United States functions comparable to those which the Inter-American Indian Institute performs among the American nations.

The National Indian Institute utilizes the administrative facilities of the Office of Indian Affairs and receives guidance from a Policy Board composed of the Commissioner of Indian Affairs, two or more members appointed by the Secretary of the Interior, one of whom must be an Indian, and one representative each to be designated by the Secretary of State, the Secretary of Agriculture, the Smithsonian Institution, the Librarian of Congress, the National Research Council, the Social Science Research Council and the American Council of Learned Societies.

The Department of Interior representatives on the Board are Assistant Secretary Oscar L. Chapman, who will serve as chairman, Mr. Rene d'Harnoncourt, General Manager of the Indian Arts and Crafts Board, Mr. D'Arcy McNickle, who is the Indian member of the Board, and Mr. John Collier, United States Commissioner of Indian Affairs, who serves as the director of the Institute.

Activities of the Institute During the Last Year

The National Indian Institute last year sent two field representatives to Latin America to investigate the Indian policies of the various countries, to describe the work of the several divisions of the governments dealing with the Indian problems, and to evaluate the effectiveness of that work. Reports on the Indian policies of Venezuela, Ecuador, Peru, Brazil, and Guatemala were prepared and the data were collected for an evaluation of these policies. These reports have had wide distribution among United States officials interested in Latin American collaboration.

The war has served to focus the attention of the American people upon the necessity of improving our relations with the peoples of other American republics. In this process we are discovering that in many of these countries the Indians constitute the bulk of the population. We are finding out, too, that if we are to get rubber from Brazil, tin from Bolivia, and other strategic minerals from the Central and South American countries we shall be dependent almost entirely upon Indians for labor and transportation. Thirty million Indians in the Western Hemisphere are a significant percentage of the total population, indicating that only in our provincial North American thinking has the Indian and his culture ceased to live and function. With the increased emphasis upon Pan-Americanism we shall hear much more of the Indian in the post-war era.

For many years the record of the United States in its handling of its Indian minority served only to create fear among the countries south of the Rio Grande with large Indian groups. Fortunately, however, the new Indian program of the United States, increasingly effective over the last dozen years, has exhibited nearly all that the Indians of the southern countries could hope for. This new program has emphasized the changed attitude on the part of the United States toward a minority of a different culture and blood, and constitutes a reassurance to our neighbors. It has provided one of the needed foundations for Hemisphere cooperation.

Indian Arts and Crafts

The impact of the war economy on the production and merchandising of Indian arts and crafts has created many new problems that threaten the gains made in this field under the guidance of the Indian Arts and Crafts Board. General regulations governing production and commerce in the emergency must be formulated mainly to fit

industrialized production and therefore often create excessive hardship among Indian craftsmen. The WPB regulation prohibiting the use of wool in the manufacture of drapes and floor coverings, for example, would have barred thousands of Navajo weavers from earning a cash income. Since these Indian weavers are not in a position to change their technique or to use other raw materials, and since the total wool consumption by Indian weavers is relatively small, their case was presented by the Board to the appropriate authorities, and an exemption was secured for textiles that are both hand-woven and hand-spun. A similar problem was presented by the restriction on the use of silver for purposes nonessential to the conduct of the war.

The intervention of the Board has been and is still needed in the establishment of price ceilings and the posting of price lists based on price levels as of certain dates in the past. Since many Indian products are not made in accordance with accepted standards, but vary from piece to piece, arrangements must be made to allow for the evaluation of those products for which no precedent has been established.

One of the tasks of the Board in wartime is to keep up crafts production among those groups who are unable actually to participate in work that is directly connected with the war. This is particularly important, since many of the jobs now available to Indian labor, such as construction work on factories located near reservations, are only of a temporary nature.

The present decrease in tourist trade, that is due to the current transportation difficulties, has been felt in many regional outlets for Indian arts and crafts. To overcome these difficulties, the Board is organizing new temporary retail outlets in areas not affected by travel limitations. The Board has also continued its long-range activities of initiating and enlarging Indian production and merchandising organizations.

The Northern Plains Indian Arts and Crafts Association, located on the Blackfeet Reservation at Browning, Mont., has for the first time, during the past summer, offered products from several other nearby reservations, such as Fort Belknap, Rocky Boy, and Flathead. On each of these reservations, production groups have been or are now being organized to supply the Northern Plains Arts and Crafts Association with merchandise.

Surveys to be used for the organization of production and merchandising units have been made among the Hopi, the Maricopa, and the Yavapai.

Research Projects

Several research projects have recently been organized which should prove of far-reaching value to Indian administration.

The first of these is a study of Indian diet, a study intended to determine the effects on food habits, of custom, tribal project, economic factors, and education. The study is to be comparative of tribes of different environment and tradition. Pilot studies have been completed on the Papago, Hopi, and Navajo reservations for comparative purposes in two Spanish-American communities in New Mexico. The Indian Service and the University of California are jointly undertaking this study, field direction under the oversight of Dr. Robert Redfield, being provided by Dr. Fred H. Steward, assistant professor of anthropology at the university. The American Indian Institute has signified its wish to extend the study to Latin America.

Of still deeper significance is a study of personality development of Indian children begun tentatively on the Papago Reservation in February and now broadened into a well-organized project on several reservations: Papago, Navajo, Hopi, Zuni, Zia, and Pine Ridge. The research seeks to describe how Indian children grow up, how they are molded by the world of family, of tribal customs, of white society, and government personnel, and how they take their places as adults. The data gathered by this inquiry will be coordinated by a special staff under the chairmanship of Dr. W. Lloyd Warner, professor of sociology and anthropology at the University of California and will be available at the same time for administrative consultation by the Indian Service. This project also has been accepted as an international one by the inter-American Indian Institute.

The study of the relationships of Navajo medicine and modern medicine, mentioned in last year's report, has been continued during the year and will extend throughout the fiscal year 1941. The study was first begun by Dr. Alexander Leighton and Dr. I. D. Leighton of Johns-Hopkins. Dr. Dorothea Leighton has been retained by the Indian Service and will continue the study. She already is giving Indian Service physicians an insight into the means of utilizing the therapeutic values inherent in the songs, ceremonies, and healing herbs, sweat baths, and other aspects of the native medicine and religion.

Dr. Alexander Leighton was called to active duty by the War Relocation Authority but fortunately the Office was able to obtain his detail to the Relocation Center on the Colorado River Reservation to conduct the needed research in connection with the administration of the Center where many social problems confront the administrative staff.

le this particular research does not deal directly with Indians, findings should be of inestimable value in future dealings with groups where many of the same problems are to be found. It is even probable that this study will prove helpful in coping with some of the problems of colonial administration which will be encountered in the post-war reconstruction the world over.

Medical Research

Indian Service continued during the year its tuberculosis case work, although the loss of personnel handicapped these efforts somewhat. A general survey revealed 419 fewer new cases than the year of 1937, indicating at least a slow but definite progress in the abatement of this scourge among the Indians.

Treatment of trachoma by sulfanilamide has continued to produce encouraging results. Although close laboratory check has been discontinued, most patients receiving treatment are hospitalized in order to insure supervision. Sixty to eighty percent of all cases treated reported arrested with remarkable improvement in vision. Many patients are now entirely free of the disease.

Publication of Handbook of Federal Indian Law

One of the outstanding contributions to Indian administration was made during the past year with the publication of the Handbook of Federal Indian Law by Felix S. Cohen, Assistant Solicitor of the Department of the Interior.

Based on a compilation of some 4,000 statutes and treaties and judicial decisions and administrative rulings, the handbook traces the development of Federal Indian law, Indian administration, and Indian rights from their origin to present time. The legal basis of Federal Government's treaty relations with Indians is fully explained and there is a detailed analysis of the extended relationships of tribal self-government, Federal powers and reserve State powers over Indians. Mr. Cohen's work represents the most comprehensive ever made of laws relating to Indians in the United States.

Indian Service Personnel Hard Hit by War

Indian Service personnel administration has experienced the worst perhaps of all times. Scores of employees have left to join the armed forces. Many others have transferred to agencies more closely connected with the war.

The medical service has been especially hard hit. Twenty physicians and six part-time physicians have been called to duty with the armed forces. Replacements are difficult to obtain. An additional 15 physicians hold reserve commissions and can be called at any time. Some have also left the Service to enter private practice. There is now a 70-percent coverage of the Indian Service by full-time physicians. This situation is alarming and it is imperative to provide Indians with even the most essential medical care.

Nurses likewise have been called to the armed forces. There are 200 vacant positions among the Indian Service hospital and clinic nurses. The situation is particularly acute in Alaska where transportation of newly appointed nurses often delayed for months. To help meet this critical situation the Indian Health Service is broadening and intensifying its training program for Indians. Classes for hospital aides at the Kiowa hospital in Oklahoma now enroll 40 students instead of 20. Graduation occurs after 6 months of training instead of the usual 9. Sixty men are being trained as hospital orderlies and interpreters at various centers, following a regular schedule of work. Hundreds of Indians and employees are being given first aid and home nursing courses.

Restrictions in local transportation due to rubber shortages limits the effectiveness of those employees who remain. Ingenious methods of increasing the scope and effectiveness of the employees are appearing on every hand. Extension agents and field workers are riding horses. Regional supervision has been materially reduced.

There has been a continual recasting of the functions of the Indian Service. Essential war activities must go on, such as food production, production of strategic minerals, protection and utilization of forests, production and protection, and cooperation with the War Department in securing gunnery and bombing ranges and airports. Other activities not immediately war connected will be maintained to the extent possible with limited personnel. Every effort will be made to continue to provide medical care and to maintain school facilities for Indian children, and to operate other functions essential to the welfare of the Indians.

Civilian Conservation Corps

CONRAD L. WIRTH, Representative, Department of the Interior,
Advisory Council, Civilian Conservation Corps

DURING the fiscal year ending June 30, 1942, six bureaus and as of the Department of the Interior supervised the conservation development of the Nation's natural resources through the operation of an average of 309 Civilian Conservation Corps camps 71 CCC-Indian units in the continental United States and an average of 8 camps in Hawaii, Alaska, and the Virgin Islands. Projects undertaken by the CCC included the protection and improvement of Federal Grazing lands and Indian reservations; protection and propagation of wildlife; development of recreational facilities in National, State, and local parks; cooperation in the development of irrigation and hydroelectric power programs; broad preservation of the public domain; and rehabilitation of the human natural resources of the islands and territorial possessions.

General Land Office Camps

The General Land Office operated three Civilian Conservation Corps camps in Oregon, and one in Wyoming, and carried on a program in the Territory of Alaska. The camps in Oregon were assigned to the conservation, protection, and development of the 2,500,000 acres of Oregon and California revested lands, an important reservoir of commercial timber being put on a sustained-yield basis to provide a productive forest in perpetuity. The declaration of war, however, caused concentration on activities directly connected with the waging of the war, with the resultant curtailment of forest conservation work. Despite this diversion of strength from conservation projects and the reduction of personnel, however, the camps continued their forest protection and utilization work. Since the Oregon and California forests are an important source of timber for military purposes, every effort must be made to protect it and make it available for present use. The Wyoming camp, until it was closed in May, continued its work in suppressing the outcrop coal fires which were threatening with

destruction an inestimable amount of the Nation's coal reserves in the vicinity of Little Thunder Basin, Wyo. These deposits are a fuel reserve of untold value.

During the year 11 coal fires were attacked, 4 of which were completely suppressed. Although all of the fire suppression projects have not been completed, all except one are in good enough shape to withstand weathering and further combustion for some time due to lack of attention.

Civilian Conservation Corps activities on the 325,000,000 acres of public domain in Alaska were transferred to the General Land Office on April 1, 1940. Since the impact of the war prevented completion of the planned number of whites, the enrollment was limited to native Alaskan Indians and Eskimos. The program was directed mainly for the benefit of the native peoples. Working in cooperation with the Office of Indian Affairs, the General Land Office coordinated its enrollment, work projects, and camp locations with the development program of the Indian Office. Wherever CCC camps were established in villages in dire need of assistance and where projects would benefit the entire community. About 50 villages were benefited during the year.

One of the greatest problems in Alaska is transportation. Personnel maintained and staked winter sled trails and new winter landing fields to make mail, freight, and passenger travel possible with a minimum disruption in service.

Office of Indian Affairs

Both the work projects and training activities of CCC in the Office of Indian Affairs were modified during the past fiscal year. The whole program would be made to contribute directly to the preparation of the war.

At the invitation of the War Department, three projects were taken on military reservations to relieve troops for training. These would otherwise have been required to do this work. Typical of the work rendered was one project where Indian enrollees, using CCC equipment, cleared and leveled the drill fields, removed brush and filled in gulleys, cleared away debris left by the gas contractors, built camouflage structures, constructed a small range, and a small arms practice range.

During the year, approximately 2,000 Indian enrollees completed themselves through national defense training courses for employment in war industries. Over 8,000 Indians have been trained in forest fire fighting and a similar number have completed the Red Cross standard or advanced first-aid training. The Indian first-aid instructors in the CCC-Indian division

operated by the Indian CCC are located at strategic places in forest or range areas, thus providing trained crews ready for instant call in emergency service. Other CCC-Indian division activities have centered around the Indian communities, thereby permitting close coordination between CCC and the local programs for civilian defense.

Results of the work of Indian CCC which are helping to win the war are becoming increasingly evident. The enlarged carrying capacity of ranges, the saving and storage of water for livestock and for irrigation, the conservation of ranges and forests, are enabling the Indian reservations to yield increased quantities of needed food and wood products.

Bureau of Reclamation

During the fiscal year 1942 there was a reduction in the number of CCC camps assigned to the Bureau of Reclamation from 43 camps in operation on July 1, 1941, to 7 camps in operation on June 30, 1942. The termination of the camps assigned to the Bureau was effected in company with a general reduction of all camps within the Civilian Conservation Corps.

In general, the year's activities were a continuation of previously initiated programs, accentuated to reflect the country's war program. The development of irrigation facilities and the rehabilitation of existing irrigation facilities were stressed for early completion.

National Park Service

The fiscal year 1942 saw a marked change in the Civilian Conservation Corps program conducted by the National Park Service. The development of park and recreational areas gave way to the urgent business of developing military reservations with the many facilities needed for proper training of the armed forces that had to be made available quickly. In July 1941, 262 continental CCC camps were operating under the technical supervision of the National Park Service, 20 assigned to areas under the jurisdiction of the Army and Navy, 83 to national parks and monuments, 21 to recreational demonstration areas, 113 to State parks and 25 to county and metropolitan areas. Because of reduced enrollments numerous reductions in over-all CCC operations were made until at the close of the year only 89 camps were being operated, with 50 assigned to military and naval areas, 20 to national parks and monuments, 10 to recreational demonstration areas and 9 to State parks.

With the declaration of war, the National Park Service terminated CCC projects which were not directly related to the war effort. By the end of the year all work was progressing in the interest of the full

war program. The on-the-job training that the enrollees had in the development of public lands for park and recreational purposes equipped them well for the work required at the many larger reservations. This enabled the armed services to devote more attention to the important job of providing military training.

The realigned CCC programs for the protection of Federal areas were planned for defense against direct enemy attack, and other war hazards to forests, waters, strategic structures and physical improvements. Major emphasis was placed upon personnel and organization for protection of important natural resources and strategic facilities against incendiary fires and high explosives of personnel against war gases. But consideration was also given to the protection of forest and grass lands which represented the watersheds essential to agriculture, power, and domestic water.

Civilian Conservation Corps activities in the Territory of Alaska continued with an authorized strength of 675 enrollees. Until December 8, general conservation projects were prosecuted. Thereafter CCC engaged in emergency work directed by the Army. The time work has been reported to be of great importance to the military authorities.

The CCC in the Virgin Islands completed an important well-being program started in the previous year. Also much general conservation and development work was continued. After the declaration of war CCC labor and resources were used on defense projects requested by the military authorities.

Grazing Service

The facilities of the Civilian Conservation Corps were utilized by the Grazing Service in the construction and maintenance of range improvement projects on the public domain during the past year. The work was equitably distributed among the 58 Federal grazing districts located in the 10 Western States of Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, and Wyoming. These districts embrace a total of 142,000 acres of range land which provides forage for the seasonal grazing of 11,000,000 head of livestock.

At the beginning of the fiscal year 63 camps were assigned to the Grazing Service. The number was gradually diminished, however, until only 10 were in operation at the end of the fiscal year.

In the last half of the year much of the regular range improvement work was deferred in order to concentrate on projects which would contribute more directly to the war objectives. Minor roads were built to mines and mills engaged in the development and production of strategic minerals. Roads were also built to aid in the construction of military installations.

operation of bombing areas, gunnery ranges and emergency landing fields. And, in one instance, many miles of road were constructed parallel to an international boundary as an aid to border patrol. The Grazing Service reproduction plants, manned largely by CCC enrollees, produced many maps and photographs for the Army and various defense agencies.

On December 9, 1941, less than 48 hours after Pearl Harbor, the Grazing Service, working in conjunction with the Office of Civilian Defense of the State of Utah and the Army, established a detection service for reporting the approach of aeroplanes. Ten Civilian Conservation Corps camps are equipped with radios and 24-hour service has been maintained. Any unusual movement of planes is immediately reported by radio to our station and the information relayed to the Office of Civilian Defense and the Army.

The CCC camps of the Grazing Service supplied the main source of power for our program of range and forest fire protection during the year. Extensive training in fire suppression was given to selected enrollees in order that well-trained and efficient crews would be ready in any emergency.

Fish and Wildlife Service

The amount of wildlife conservation and developmental work accomplished this year by the CCC on refuge areas was greatly diminished due to the gradual decrease of the number of camps under jurisdiction of this Service from 36 to 12. Existing camps have been or are being converted as rapidly as possible from work on the refuge areas to more important essential war work in order to furnish the greatest possible aid to our war effort. During the year this Service had 4 camps directly engaged in the development and improvement of military areas, and arrangements are being completed to transfer the remaining 8 camps which are scheduled to this Service either to military areas or on projects necessary for the conservation of our natural resources most important to the war program.

Division of Territories and Island Possessions

GUY J. SWOPE, Director

THE impact of war on the offshore areas coming under the supervision of this Division has overshadowed all other events. The war brought about changes in the lives of the people in the continental United States, but it can truthfully be said that every aspect of life has been affected to a much greater extent in all our offshore areas. In a report such as this it has been customary to present considerable statistical information as to progress made during the preceding year; but it does not seem advisable to attempt to do so in any detail in this report primarily for military reasons, and also due to the fact that statistics in a war economy, particularly such as in effect in our offshore areas, are distorted to such an extent that they are almost meaningless.

The general pattern during the year up to December 7, in all these areas, was almost the same. Feverish defense preparations and the expenditure of large amounts of Federal funds had brought about increased employment. On the other hand, the cost of living was going up rapidly and the shipping problem was causing widespread adjustments in the internal economy of the offshore areas. The controls which the United States Government placed over exports and the supply of strategic material and equipment presented additional problems. Other factors which caused intricate and difficult situations, notably in the Philippines, were the orders establishing control over assets belonging to aliens.

These conditions were bringing home to the people the imminence of war and, to a much greater extent than prevailed generally on the continent, the people and local officials visualized the problems which would bring to the civil governments and the civilian populations. Preparations for civilian defense were under way in all areas for it was realized where the brunt of opening attacks would be likely to fall.

Attacks on Hawaii and the Philippines were almost simultaneous; these were soon followed by hostilities in Alaska. With these

attacks the people of the offshore areas settled down in the grim business of war.

The people of these areas reacted in a manner which was a source of pride and satisfaction to the government. Whatever sins of omission and commission may have been in respect to the inhabitants of areas over which the American flag was less than 50 years ago, the fairness and justice of basic policy at a time of real emergency, bore abundant fruit. All joined in the common defense of a system of government, the advantages of which were more appreciated by residents of insular areas than they were, in many cases, by residents of the continental areas. For generations had never known any other system of government and had come to take their rights and privileges as a matter of course.

A brief résumé of conditions in each area follows:

The Territory of Alaska

Actual hostilities came to Alaska in June 1942, when the United States Naval Base at Dutch Harbor was bombed and this was followed shortly by the occupation of the three western-most islands, Agattu, and Kiska. Even before this attack, the Territory had been declared a combat zone. These attacks brought about the continuation and expansion of a program which has been in operation for 2 years, a program which has affected every aspect of life in Alaska, and seemed certain to bring about even more far-reaching changes.

Just what part Alaska is playing in the war cannot be reported at this time, but eventually the record will form an important chapter in the history of the Territory.

The routine affairs of the Territory and the activities of the Federal agencies which function in the Territory were carried on as well as could be expected under abnormal conditions. The activities of the territorial government are in excellent shape. The Federal agencies which operate in the Territory do so largely on their own funds which relieves the Territory from what would otherwise be a heavy burden. Cooperation between representatives of the Federal Government and the territorial officials has been excellent. One Federal activity, the Civilian Conservation Corps, carried on its functions on the last day of the fiscal year. The work done by the organization in its 9 years of operation in constructing landing fields in remote areas and the building of docks, roads, etc., is proving of immense value in the defense program. Much work was done during the year in the development and protection of wildlife resources which is one of the major assets of the Territory. Both the Territory and Federal agencies concerned give special

tion to the problems of the native population and the means of adjusting them to a rapidly changing social and economic order. An extensive program of education and public health designed to fit the peculiar interests of the natives is followed.

The general public in the United States has little conception of the present importance of Alaska industries to the economy of the United States and the latent possibilities of their development of these resources. Products of the mines, and of the fish, fur, and lumber industries are of tremendous value in a wartime economy. Alaskan spruce is of importance in the manufacture of airplanes and there are extensive forests suitable for the manufacture of newsprint. It may reasonably be expected that one result of the war will be the development of aviation both for passenger and freight traffic beyond anything formerly even dreamed of. More than any other area under the American flag, such a development would be of importance to Alaska and the possibilities of aviation and other means of communication which are being improved as a result of the military program as a means of developing the latent resources of the Territory are almost unlimited.

The Alaska Railroad

The Alaska Railroad operated 500.8 miles of line the year around, furnishing passenger and freight service between Seward and Fairbanks, and on branch lines serving the Matanuska and Nenana coal fields.

The passenger train schedule in effect during the summer of 1941 provided for three round trips weekly between Seward and Fairbanks, one weekly between Fairbanks and McKinley Park, and one every 2 weeks between Fairbanks and Nenana. No regular schedule was maintained from September until January, when a weekly trip between Anchorage and Fairbanks was made. Beginning April 24, three round trips weekly were made between Seward and Anchorage.

Both passenger traffic and freight tonnage showed substantial increases over last year. A new freight house was built at Anchorage, and a new concrete depot and general office building is under construction there. A dormitory and mess house was completed at Eska Coal Mine.

River boat service was maintained during the season of river navigation from Nenana to Tanana, Ruby, Holy Cross, and Marshall.

Territory of Hawaii

Immediately following the attack on Pearl Harbor on December 7, 1941, the Territory was transformed instantaneously into the center

of an active combat zone. The Governor of the Territory proclaimed a state of martial law and suspended the writ of habeas corpus.

Under an act passed a few months before known as the "Defense Act," steps had been taken prior to the attack by the Japanese authorities to prepare for war. The Office of Civilian Defense was sufficiently well organized to swing into immediate action with 17 divisions and 12 subdivisions, employing a total of 2,529 employees augmented by some 14,000 volunteers. From funds provided by the Department of the Interior for civilian defense in Hawaii assistance was rendered and is being continued to four agencies not directly under OCD—the office of the military, the public health service, public and private hospitals, and county and fire departments.

The more important divisions under the OCD, all of which are functioning continually, include the bomb disposal division; communications; gas defense; mortuary and burial division; plans and maps; women's division; demolition, rescue and repairs; transportation; air-raid wardens, with nearly 5,500 volunteer members; evacuation division, emergency medical division, including supervision of blood plasma banks, first-aid stations and emergency ambulance service, the civilian emergency hospital and nursing school; registration division; and bureau of classification.

Despite the dislocation in all phases of life and economy engendered by the state of war, the financial condition of the Territory continues to be excellent, it was indicated by the general fund receipts for the fiscal year which totaled \$22,065,468.54 as compared with estimates as prorated for the fiscal year of \$19,707,155.22, an increase of \$2,358,313.33. From a review of a further prorated estimate for the next fiscal year it is felt that an unexpected surplus of the general fund at the close of the present year ending June 30, 1943, will approximate \$4,000,000 in the light of emergency conditions.

Cash on hand and in banks of all funds deemed to be in the Territory of Hawaii amounted on June 30 to \$24,529,428.50, an increase of \$4,923,150.51 over the \$19,606,277.99 on hand and in banks on June 30, 1941.

Collections of the Territorial Harbor Board in the fiscal year ending June 30 were \$891,336.51, a decrease of \$66,591.53 from the previous year, due to the current war conditions since February 7, 1941.

This decrease was brought about by reason of the fact that shipping between the Territory and overseas as well as inter-island shipping was operated after December 7, 1941, by agents of the Federal Government which paid no charges. Negotiations are being made by which it is hoped that the territorial government

required to maintain such harbor facilities may be reimbursed by the Federal Government.

The Governor of the Territory points with pride to the fact that Federal internal revenue collections for the fiscal year amounted to \$32,067,927, an increase of more than 100 percent. As compared to the situation in other offshore areas, the Territory may well be proud of this record.

Production and shipment of canned pineapple and pineapple juice continued throughout the year in nearly normal quantities, shipments in the 12 months ended May 21, 1941, having been 11,056,491 cases of pineapple and 11,284,938 cases of pineapple juice. The Federal Government purchased substantial quantities of these and announced that its requirements for the coming year would be 34 percent of the canned pineapple pack and 21 percent of the juice pack for Army, Navy and lease-lend shipments.

Shipments of raw sugar, Hawaii's other principal agricultural product, are expected to total 850,000 tons for the calendar year 1942.

In brief, under martial law and under the broad provisions of the Hawaii Defense Act, the work of virtually every Territorial department has been turned in some degree to furthering the war effort of the United States. War and the Nation's program has affected in some way the life of every citizen and every person resident in the Territory of Hawaii.

Territory of Puerto Rico

Employment rose during the year to levels hitherto unknown in the labor history of Puerto Rico. Work on the various military establishments now under construction on the island thinned out appreciably the legions of the unemployed, once a salient feature of the local economic scene.

Wages likewise rose. Increased employment, the operation of the Fair Labor Standards Act, and heightened union activity, all combined to ordain sorely needed adjustments. An additional factor, the Insular Minimum Wage Law, is expected to make a similar and important contribution during the coming year; it became operative at too recent a date to make itself felt at this writing.

Prospects for the immediate future, however, are distinctly less promising, for as the year drew to a close the employment situation took a sudden turn for the worse. The cumulative effects of the shipping problem became increasingly evident as shortages of raw materials, consumption commodities and gasoline dictated curtailed operations in private business. Widespread dismissals of employees ensued, and to aggravate matters, they came at a time when defense projects were nearing completion.

of an active combat zone. The Governor of the Territory proclaimed a state of martial law and suspended the writ of habeas corpus.

Under an act passed a few months before known as the "Hawaii Defense Act," steps had been taken prior to the attack by the civil authorities to prepare for war. The Office of Civilian Defense was sufficiently well organized to swing into immediate action with its 17 divisions and 12 subdivisions, employing a total of 2,529 persons, augmented by some 14,000 volunteers. From funds provided by the Department of the Interior for civilian defense in Hawaii, financial assistance was rendered and is being continued to four additional agencies not directly under OCD—the office of the military governor, public health service, public and private hospitals, and county police and fire departments.

The more important divisions under the OCD, all of which are functioning continually, include the bomb disposal division; communications; gas defense; mortuary and burial division; plans and training; women's division; demolition, rescue and repairs; transportation; air-raid wardens, with nearly 5,500 volunteer members; evacuation division, emergency medical division, including supervision of the blood plasma banks, first-aid stations and emergency ambulance service, the civilian emergency hospital and nursing activities; registration division; and bureau of classification.

Despite the dislocation in all phases of life and economy in Hawaii engendered by the state of war, the financial condition of the Territory continues to be excellent, it was indicated by the general fund revenue receipts for the fiscal year which totaled \$22,065,468.54 against the estimates as prorated for the fiscal year of \$19,707,155.21, or an increase of \$2,358,313.33. From a review of a further revision of estimates for the next fiscal year it is felt that an unappropriated surplus of the general fund at the close of the present biennium on June 30, 1943, will approximate \$4,000,000 in the light of present emergency conditions.

Cash on hand and in banks of all funds deemed to be in the Treasury of Hawaii amounted on June 30 to \$24,529,428.50, an increase of \$4,923,150.51 over the \$19,606,277.99 on hand and in banks as of June 30, 1941.

Collections of the Territorial Harbor Board in the fiscal year ended June 30 were \$891,336.51, a decrease of \$66,591.53 from those of the previous year, due to the current war conditions since December 7, 1941.

This decrease was brought about by reason of the fact that all shipping between the Territory and overseas as well as interisland shipping was operated after December 7, 1941, by agencies of the Federal Government which paid no charges. Negotiations are under way by which it is hoped that the territorial government which is

required to maintain such harbor facilities may be reimbursed by the Federal Government.

The Governor of the Territory points with pride to the fact that Federal internal revenue collections for the fiscal year amounted to \$32,067,927, an increase of more than 100 percent. As compared to the situation in other offshore areas, the Territory may well be proud of this record.

Production and shipment of canned pineapple and pineapple juice continued throughout the year in nearly normal quantities, shipments in the 12 months ended May 21, 1941, having been 11,056,491 cases of pineapple and 11,284,938 cases of pineapple juice. The Federal Government purchased substantial quantities of these and announced that its requirements for the coming year would be 34 percent of the canned pineapple pack and 21 percent of the juice pack for Army, Navy and lease-lend shipments.

Shipments of raw sugar, Hawaii's other principal agricultural product, are expected to total 850,000 tons for the calendar year 1942.

In brief, under martial law and under the broad provisions of the Hawaii Defense Act, the work of virtually every Territorial department has been turned in some degree to furthering the war effort of the United States. War and the Nation's program has affected in some way the life of every citizen and every person resident in the Territory of Hawaii.

Territory of Puerto Rico

Employment rose during the year to levels hitherto unknown in the labor history of Puerto Rico. Work on the various military establishments now under construction on the island thinned out appreciably the legions of the unemployed, once a salient feature of the local economic scene.

Wages likewise rose. Increased employment, the operation of the Fair Labor Standards Act, and heightened union activity, all combined to ordain sorely needed adjustments. An additional factor, the Insular Minimum Wage Law, is expected to make a similar and important contribution during the coming year; it became operative at too recent a date to make itself felt at this writing.

Prospects for the immediate future, however, are distinctly less promising, for as the year drew to a close the employment situation took a sudden turn for the worse. The cumulative effects of the shipping problem became increasingly evident as shortages of raw materials, consumption commodities and gasoline dictated curtailed operations in private business. Widespread dismissals of employees ensued, and to aggravate matters, they came at a time when defense projects were nearing completion.

of an active combat zone. The Governor of the Territory proclaimed a state of martial law and suspended the writ of habeas corpus.

Under an act passed a few months before known as the "Hawaii Defense Act," steps had been taken prior to the attack by the civil authorities to prepare for war. The Office of Civilian Defense was sufficiently well organized to swing into immediate action with its 17 divisions and 12 subdivisions, employing a total of 2,529 persons, augmented by some 14,000 volunteers. From funds provided by the Department of the Interior for civilian defense in Hawaii, financial assistance was rendered and is being continued to four additional agencies not directly under OCD—the office of the military governor, public health service, public and private hospitals, and county police and fire departments.

The more important divisions under the OCD, all of which are functioning continually, include the bomb disposal division; communications; gas defense; mortuary and burial division; plans and training; women's division; demolition, rescue and repairs; transportation; air-raid wardens, with nearly 5,500 volunteer members; evacuation division, emergency medical division, including supervision of the blood plasma banks, first-aid stations and emergency ambulance service, the civilian emergency hospital and nursing activities; registration division; and bureau of classification.

In brief, under martial law and under the broad provisions of the Hawaii Defense Act, the work of virtually every Territorial department has been turned in some degree to furthering the war effort of the United States. War and the Nation's program has affected in some way the life of every citizen and every person resident in the Territory of Hawaii.

Territory of Puerto Rico

Employment rose during the year to levels hitherto unknown in the labor history of Puerto Rico. Work on the various military establishments now under construction on the island thinned out appreciably the legions of the unemployed, once a salient feature of the local economic scene.

Wages likewise rose. Increased employment, the operation of the Fair Labor Standards Act, and heightened union activity, all combined to ordain sorely needed adjustments. An additional factor, the Insular Minimum Wage Law, is expected to make a similar and important contribution during the coming year; it became operative at too recent a date to make itself felt at this writing.

Prospects for the immediate future, however, are distinctly less promising, for as the year drew to a close the employment situation took a sudden turn for the worse. The cumulative effects of the shipping problem became increasingly evident as shortages of raw materials, consumption commodities and gasoline dictated curtailed operations in private business. Widespread dismissals of employees ensued, and to aggravate matters, they came at a time when defense projects were nearing completion.

Organized labor registered a general advance during the year. New unions sprang up and became affiliated with existing organizations as discrimination against unionized employees tailed off under the National Labor Relations Act. A companion measure "To Protect Workmen and Employees Against Prejudicial Discrimination of Their Employers, etc.," was passed by the Insular Legislature and approved toward the close of the fiscal year.

However, the upward trend of wages can hardly be considered to have been adequate in the face of the proportionally greater increase in the cost of living that was registered during the year. Taking the year 1938-39 as a basis, it appears that indexes of wage rates were 130 for industrial workers, 136 for commercial employees, and 128 for office workers, whereas price indexes of the main constituents of the Puerto Rican labor diet were 191 for rice, 310 for codfish, 181 for beans, and 157 for fats; the index for all foods was 172.

As is to be expected in a period characterized by rapidly expanding commercial activity, increasing employment, and a rising cost of living, there were frequent industrial disputes during the year. The Department of Labor aided in the conciliation of 71 strikes and controversies involving 26,740 workers. In this task the Department enjoyed the cooperation of the United States Conciliation Service in the person of Commissioner Charles Goldsmith, whose extremely valuable assistance in preventing and adjusting strikes served to promote industrial peace, especially in those operations affecting the program of national defense.

A wealth of social and labor legislation was passed and approved during the year with a view to promoting the welfare of insular society in general and of labor in particular.

The financial progress achieved during the fiscal year amounted to \$10,650,411.82, as against \$2,960,415.82 for 1940-41. The general fund showed a balance of \$20,526,788.18, compared to \$6,447,843.39 for the previous year.

Total tax collections from the alcoholic beverage industry and from narcotics reached a new high at the close of the fiscal year under report. Total collections reverting to the general fund amounted to \$18,044,306.23, an increase of \$10,639,184.10, or 143.67 percent above the previous year's collections, which amounted to \$7,405,122.13.

The tax collections on Puerto Rican rum shipped to the United States constitute the largest amount ever collected on the island from a single source of government income. The unprecedented increase for the present year is accounted for by the rapid growth of the local rum industry, and the favorable market conditions prevailing in the United States.

Income-tax collections also reached a new high during the period under review. Total collections amounted to \$7,635,382.93 as com-

pared to \$2,843,433.42 for the previous year, the increase amounting to \$4,791,949.51.

During the year the Treasurer of Puerto Rico revised the revenue estimates for the general fund increasing them from \$20,450,000 to \$35,200,000, but the revenue collections actually totaled \$37,578,862.49.

Outstanding bond obligations of The People of Puerto Rico on July 1, 1942, amounted to \$23,700,000, as against \$26,975,000 on July 1, 1941. During the year bonds were redeemed in the sum of \$3,275,000.

The Virgin Islands

By reason of their strategic location not only as the most eastern outpost of the United States but also as the keystone of the arch protecting the Caribbean Sea approaches to the vital Panama Canal, it is most natural that the major concern of the Virgin Islands during the past year has been that of defense, both military and civilian.

Such has been the scope of the defense plans and their fulfillment that perhaps in no other place under the American flag has the normal economic and social structure of community life been so radically affected. Months before our entry into the war, the administration recognized the gravity of the geographical position of the Virgin Islands. Steps were initiated immediately toward a concentrated program of civilian defense. There was a prompt organizing of Councils of Defense by both island municipalities which were quick to move into active intensive programs. When war did come, the Virgin Islands defense program was well under way.

In this connection it is gratifying to note the comments of James M. Landis, Director of the United States Office of Civilian Defense, on examination of a report of civilian defense activities in the islands:

From these small dots of American soil in one of the world's most critical defense zones, we get a splendid example of civilian alertness to common danger and timely cooperation to meet it with adequate measures. We must put into practice in the Nation much of what these islands, which have an area of only 133 square miles, have already done.

On the islands of St. Thomas and St. Croix there have been extensive military preparations. What has been done in the past and what the effects have been may not properly be reviewed in detail. It can be said, however, that the entire population of the islands has responded in an excellent manner and that they have demonstrated their patriotism and loyalty to the United States.

The war has emphasized the difference in economy between the islands of St. Thomas and St. Croix. The resources of St. Thomas are commercial and the increases in trade stimulated by war activities raised the estimated municipal revenues of St. Thomas

nearly \$600,000, thus making it possible for the municipality of St. Thomas and St. John, for the first time since the purchase of the islands by the United States in 1917, to be financed without Federal deficit appropriation.

The economy of the municipality of St. Croix is agricultural and has been adversely affected during the last 5 years by repeated drought. During the year, the Municipal Council of St. Croix with the approval of the present administration repealed the iniquitous export tax of a ton on sugar, which tax was among the burdens that destroyed the private sugar industries of St. Croix and added to the losses of the Virgin Islands Co. which was established by the government to provide employment and a market for small farmers. Existing nowhere else under the United States flag, the repeal of this tax had been urged for many years. About the time of the tax repeal, the present administration succeeded in having Congress apply to the Virgin Islands the Sugar Act of 1937. Heretofore St. Croix had been the only sugar-producing area of the United States that did not share the benefit payments provided by that act, in spite of the fact that St. Croix's sugar was required to pay the processing tax from which such benefit payments were made to all other areas.

Employment, which is the first known measure of economic health, was at its peak on the island of St. Thomas where extensive military preparations gave remunerative employment to every employable male. In St. Croix, after months of much unemployment, the War Relocation Projects Administration and the National Youth Administration gave employment to nearly every eligible male. By the end of July, however, the WPA employment quota was severely reduced and the National Youth Administration and the Civilian Conservation Corps were abandoned. The serious effects of this, as well as the gradual reduction of employment in the municipality of St. Thomas by reason of the tapering off of military construction, will be increasingly felt in the new fiscal year. Although the employment situation was most satisfactory, it cannot be said that the economic health of the Virgin Islands is sound, despite its fair superficial appearance, because real economic health depends upon real wage and stability of employment.

In the municipality of St. Croix the new abattoir built by the Federal Government was operated as a WPA demonstration and training project. Many cattle, sheep, and hogs were slaughtered for export to St. Thomas and Puerto Rico. In St. Thomas the modern cold storage market built by the Federal Government was substantially completed. Facilities have been provided for the marketing and cold storage of all locally produced foodstuffs, fish, poultry, meat, vegetables, eggs, and dairy products. The processing, selling, and cold storing of meats have been given particular consideration.

er to serve as a companion project to the abattoir in St. Croix. It is expected that the operation of this market together with the operation of the abattoir in St. Croix will be within the framework of the Virgin Islands Co. These two units when organized for operation will be an important factor in meeting the demand for foodstuffs created by defense activities and the serious shipping situation.

The finances of the municipal government in St. Thomas were in excellent condition. For the first time since 1917, the municipality of St. Thomas and St. John was financed without a Federal deficit appropriation. The Federal deficit appropriation of \$15,000, which was made by Congress, was not used. In St. Croix the fiscal affairs of the municipality, after being at a very low ebb for many years, took a slightly more favorable turn. For the first time in 4 years it was not necessary to borrow money to meet an operating deficit over and above the Federal deficit appropriation. However, an enthusiastic reception of this golden era must be tempered by the poor potentialities of the forthcoming fiscal year.

The Philippine Islands

The Philippines are the only outlying possession of the United States under the jurisdiction of this Department that has fallen into the hands of the enemy.

In view of the growing tension in the Far East, President Roosevelt, on July 26, 1941, issued an order calling all of the organized military forces of the Government of the Commonwealth of the Philippines into the service of the armed forces of the United States for the period of the emergency.

During the preceding months, with the aid and cooperation of the American authorities, the President of the Philippines had used the emergency powers granted him by the National Assembly to prepare and carry forward the work for national and civilian defense. This foresight proved invaluable when the Philippines were attacked.

National elections were held in November 1941, for President, Vice President, Senators and Representatives to form the new bicameral Philippine Congress that was to replace the National Assembly on December 30. President Quezon and Vice President Osmena were reelected.

The outbreak of war with Japan came 3 weeks after the sixth anniversary of the establishment of the Commonwealth Government and completely changed the Philippine picture. At the celebration of that anniversary (November 15, 1941) President Quezon renewed the pledge of loyalty of the government and of the people of the Philippines to the United States and urged cooperation "in her gigantic

effort to save democracy and banish totalitarianism from the face of the earth." On December 3, 1941, President Quezon declared—

There is no territory under the American flag, including continental United States, where the people are more united behind President Roosevelt than we are here in the Philippines. . . . The flag of the United States will be defended by American and Filipino soldiers until the last round of ammunition has been fired. The whole Filipino people welcome the opportunity of testing their loyalty to America through blood and fire.

On December 8 (Manila time) the Japanese attacked the Philippines. A week later the National Assembly met and adopted a resolution declaring a state of total war emergency. President Quezon was authorized to enforce emergency regulations and he immediately commandeered food, fuel, building materials, and other prime necessities. He simplified government machinery by merging the nine cabinet positions into four key posts. When it became evident late in December that Manila could not be held against the advancing Japanese forces, it was declared an open city (December 26), and the United States High Commissioner with certain members of his staff and the President of the Philippines and cabinet members transferred their offices to Corregidor. There the second inauguration of President Quezon and Vice President Osmena took place on December 30. In his inaugural address the President reaffirmed his loyalty to the United States and pledged the Filipinos to "stand by America and fight with her until victory is won." Throughout the 4-month Luzon campaign—on Bataan which fell into the hands of the enemy on April 9 and on Corregidor which fell on May 6—Filipino soldiers heroically fought alongside Americans in defense of their country until disease and exhaustion forced them to surrender. As expressed by the President of the United States, their gallant struggle against the Japanese aggressors "elicited the profound admiration of every American."

United States High Commissioner Francis B. Sayre and certain members of his staff were transferred to Australia later in February and from there returned to Washington. Upon his arrival on March 23, Mr. Sayre submitted his resignation to the President, and it was later accepted effective as of June 30.

The President of the Philippines and members of his cabinet were evacuated to the southern part of the Philippine Archipelago late in February and subsequently transferred to Australia. Later, accepting the invitation of President Roosevelt, they arrived in Washington on May 13, and on May 14 formally established a government in exile. On many occasions since then, the President of the Philippines has reaffirmed the gratitude and loyalty of the Filipinos, stating "We stood and still stand with the United States in life and in death." He stated that his government's immediate job was to take care of

the thousands of Filipinos stranded here and abroad and to prepare for the day when his government is reestablished in Manila.

War conditions in the Philippines necessitated prompt action by our Congress. In December several measures were enacted for the purpose of dealing with the changed situation. The First War Powers Act, 1941 (Public 354, 77th Cong., approved December 18) conferred on the President of the United States broad powers to control foreign funds and enemy property. The powers of the High Commissioner were greatly extended by the delegation to him on December 19 of such powers relating to alien-owned property in the Philippines. These included authority to take over for safekeeping securities, gold bullion, silver currency and other reserves and to take steps necessary to prevent their falling into the hands of the enemy. The work of collecting tons of metal and paper in Manila and transporting them to Corregidor, where they were counted and inventoried, was performed with the aid of the Army, Navy and other government officials under most trying conditions. The paper currency and treasury certificates were destroyed; the bullion worth about \$1,500,000 and valuable securities were loaded on a submarine at Corregidor and transferred in mid-ocean to another naval vessel, which delivered them to the United States Treasury Department. Thus every ounce of gold and every security accepted by the office of the High Commissioner for safekeeping reached the United States safely.

The Sugar Act of 1937 was amended by extending for 3 years (or until June 30, 1945), payments to the Commonwealth government of taxes collected thereunder, and an additional sum of \$10,000,000 was appropriated by the Congress for public relief and civilian defense in the islands for the fiscal year 1942.

Granting in part a petition of the Philippine National Assembly, the Congress suspended until December 31, 1942, the collection of the export taxes on Philippine products and the progressive reduction of quotas prescribed in the Tydings-McDuffie Act as amended. The assembly had requested such suspension from January 1, 1941, until July 3, 1946, or during the present emergency.

The total overseas trade of the Philippines during the first 9 months of 1941 (the last period for which figures are available) amounted to \$245,532,635. Included in this figure is the value of gold and silver exports (\$38,542,914), nearly all of which came to the United States. Trade with the United States and Territories amounted to \$203,526,409, or approximately 83 percent of the islands' total trade. The Philippines purchased from the United States merchandise valued at \$90,113,868, thus occupying seventh place as a customer of the United States, as compared with ninth place in 1940. In this respect the islands were outranked by the United Kingdom, Canada, Union of South Africa, Egypt, Mexico, and Brazil, in the order named. Philip-

pine shipments to the United States, including gold and silver, amounted to \$113,412,541, or nearly 85 percent of the total exports.

The above figures reveal that, despite prevailing war conditions, **had** trade continued uninterrupted and at the same ratio for the full 12 months, the total external trade of the Philippines for the year 1941 would have exceeded that of the record year of 1929 by \$12,469,335, or nearly 4 percent. It should be noted, however, that there would have been only a slight gain of \$1,647,973 in imports. The increase of \$10,821,362 in exports would have been due entirely to the increased production of gold and silver, which rose from \$3,300,393 in 1929 to an estimated figure of \$51,390,552 in 1941.

Lack of shipping, excessive freight and insurance rates, tightening of export control and the dislocation of trade due to war conditions in Europe continued during the first 5 months of the period under review to hamper the normal interchange of merchandise. During the 3 months, July-September 1941, Philippine exports to Asia and Oceania, which in part had compensated for loss of trade with Europe, showed a decline of almost 22 percent compared with the corresponding period of 1940. The explanation for this is found in the fact that, due to the freezing of her assets, Japan's purchases for the same period had fallen from \$2,312,985 for the same quarter in 1940 to \$878,388 in 1941. On the other hand, the increased demand for war materials in the United States more than offset this loss, so that in September 1941, the American market absorbed more than 93 percent of all the products exported by the Philippines. Had it been possible to ship a substantial tonnage of the sugar held in Philippine ports because of lack of shipping space, the United States would have had a virtual monopoly of the Philippine export trade during the last part of 1941.

At the same time, however, the outlook for Philippine economy was not promising, especially as represented by the sugar industry, upon which the government depends for more than 40 percent of its revenue. The iron ore industry also had lost its best, and practically only, customer—Japan. Late in October it was reported that, beginning November 1, the United States Federal Loan Agency would begin the purchase of specified quantities of certain strategic war materials such as chrome and manganese ores and form stock-piles in case they could not be shipped at once. The course of events, however, made inoperative all measures taken to ward off an apparently impending economic crisis in the Philippines.

During the year ended June 30, 1942, payments in total amount of \$8,710,030.35 were made by this Division from funds of the Philippine government. Of this amount \$2,086,292.16 was for supplies purchased in the United States and shipped to the Philippines, \$4,109,000 was for the redemption of Philippine bonds, \$1,998,097.50 was for interest on the Philippine public debt, and the remaining \$516,640.69 was for

salaries and expenses of Philippine personnel in the United States, pensions to retired Philippine employees, and other miscellaneous items. The interest payment on outstanding bonds of the Philippine government will continue to be met from funds of the Commonwealth of the Philippines on deposit in this country. No payment of principal is due until 1946.

As of June 30, 1942, the Philippine Commonwealth had funds in a total amount of \$212,036,221.67 on deposit in the United States, \$210,047,729.54 being with the Treasurer of the United States and \$1,988,492.13 with two national banks. These funds consisted of \$134,169,734 currency reserves, \$67,900,933.78 general funds, \$9,950,000 trust funds and \$15,553.89 unexpended balance of funds set aside for the purchase of bonds.

Included in the amount of general funds mentioned is an item of approximately \$29,000,000 being the proceeds of collections of the excise tax on coconut oil, which is earmarked for the specific purposes stated in the Philippine Economic Readjustment Act of August 7, 1939. It is estimated that additional collections to be reported will raise this amount to approximately \$35,000,000.

The United States Treasury Department is also holding for the Commonwealth silver pesos with a face value equivalent to \$315,000, and gold bullion valued at \$1,500,000.

Equatorial Islands

The administration of Howland, Baker, Jarvis, Canton, and Enderbury Islands, situated in the mid-Pacific Ocean, approximately on the Equator, continued through the year without any untoward incident until the outbreak of hostilities on December 7, 1941. A detailed report on these activities is omitted on account of the war situation.

Puerto Rico Reconstruction Administration

GUY J. SWOPE, Administrator¹

DURING the past year, the impact of war in the Caribbean brought swift readjustment of several Puerto Rico Reconstruction Administration operations to meet emergency conditions. Local production of increased food supplies to take the place of imports from the States reduced by shipping difficulties became a major objective. Facilities made available by the long-range program for social betterment in Puerto Rico were placed at the disposal of the armed forces. For example, numerous prints of required portions of PRRA's aerial survey map of the island were supplied to the Army and Navy, and the Puerto Rico Cement Corporation plant which was constructed with PRRA funds has been allocating two-thirds of its daily production of high quality cement to Army and Navy projects and a substantial portion of the rest of its production is consumed by other defense projects. In addition, a butyl alcohol and acetone plant is delivering its complete production to industries having either direct or indirect war contracts.

Resettlers on PRRA lands have been moved to other locations in order that farms and homes they had occupied might be transferred to meet Army and Navy requirements. First aid emergency rooms have been provided adequately in the various urban housing projects and the fullest possible cooperation has been extended to the civilian defense authorities.

Under the expanded food production program, 175 acres of the land in the Eleanor Roosevelt Development not occupied by houses and streets has been planted in rice, beans, corn, and peas; short-term crops are intensively cultivated under PRRA supervision at the Cas-

¹ By Executive Order No. 8888 dated September 3, 1941, Guy J. Swope, Director of the Division of Territories and Island Possessions, was appointed Administrator to serve without additional compensation, vice Admiral William D. Leahy, who resigned as Administrator in December 1940 when appointed Ambassador to France. Miles H. Fairbank, Assistant Administrator, who had been interim Acting Administrator, resigned and was succeeded December 1, 1941, as Assistant Administrator in active charge of work in the field by Guillermo Esteves.

er and American Suppliers projects, and in the Lafayette District. Other, it is anticipated that at least 2,000 additional acres will be devoted to food production during the next fiscal year as the result of construction of about 600 small rural houses authorized by the President on previously undeveloped PRRA lands.

Funds Available

Contrasted with an aggregate of \$69,904,000 in relief funds made available to the PRRA during the previous 6 years of its existence, the Puerto Rico Reconstruction Administration has had only \$1,428,- available for expenditure during the 1942 fiscal year. Of this, \$5,338 represented unobligated balances as of June 30, 1941, from previous appropriations, was reappropriated by the Second Deficiency Act of 1941 to complete the purposes and objects stipulated in section 1 of the Emergency Relief Appropriation Act, fiscal year 1941; and \$253,553 was approved by the President for expenditure during the fiscal year from the Puerto Rico Revolving Fund (49 Stat. 1135) for the following projects:

housing management, replacement and repairs.....	\$186, 000
Lafayette project.....	95, 903
Stanley Farm, operation and maintenance.....	50, 000
grants to cooperatives.....	350, 000
Eleanor Roosevelt Development.....	450, 000
Administration.....	121, 650
Total.....	1, 253, 553

A summary of the year's principal accomplishments follows:

Housing Management

The PRRA manages, operates, and maintains 5 low-cost urban housing projects containing 1,051 family dwelling units, 2,589 homesteads in its 7 rural resettlement areas, and 3,129 homesteads scattered throughout the island. Most of these houses are of concrete, and are termite and hurricane-proof. In addition there are 5,272 small parcels of land which are leased for cultivation to laborers at nominal rentals. The Eleanor Roosevelt urban development near San Juan, containing about 500 dwelling units constructed under previous programs, was qualified as a defense housing project; construction of 161 additional units, financed by \$450,000 allocated out of the revolving fund was authorized, and 51 of these have been practically completed; the remaining 110 will be finished in the next few months. Occupancy as of June 30, 1942, for the urban projects was 100 percent; for the 7 rural resettlement areas 98.25 percent, and for the scattered rural

278 · Report of the Secretary of the Interior

units, 95.17 percent. Total rental collections amounted to \$1,112,390 with obligations for management, repairs, and maintenance of \$1,112,390, leaving a gross return of approximately \$112,390. With an estimated reserve of \$40,000 for future replacement and repair work, the net return of about \$72,390 as compared with \$60,000 for the preceding year.

Rural Electrification

To complete the program of previous years during which the PRRA expended approximately 9½ million dollars for hydroelectric projects, transmission and distribution lines, \$43,318 of the obligated balances authorized for use during the fiscal year was expended in supplies and machinery for the Dos Bocas hydroelectric project. The Insular Government has provided the necessary funds for the small amount of work required to bring this important project to completion and use.

Forestry

Having no further funds for continued development and protection of approximately 22,000 acres of land acquired under previous reforestation programs, the PRRA has practically completed negotiations for transfer of about 5,000 acres to the Forest Service of the United States Department of Agriculture, and the remaining 17,000 acres to the people of Puerto Rico for reforestation purposes.

Soil Conservation

To continue progress in soil conservation practices with a view to increased production of foodstuffs, the PRRA had available for the fiscal year only \$12,000 reappropriated from previously obligated balances. However, research, field, and demonstration work on insular, Federal, and private lands was continued.

Cattle Tick Eradication

The PRRA's systematic cattle-dipping program of previous years laid the foundation for providing the island with wholesome meat. To insure insular continuance of the program, the Legislature of Puerto Rico appropriated \$150,000, and the PRRA transferred the Insular Department of Agriculture and Commerce all the equipment formerly used in the work.

Loans to Cooperatives

With \$350,000 authorized for expenditure from the revolving fund, the PRRA continued the supervision, organization, and financing

eratives. Particular attention was devoted to the vegetable
eratives organized primarily with a view to exporting fresh
ables to the New York winter market. To save tomatoes, etc.,
h could not be shipped or sold to Army and Navy bases or in the
l markets, small loans were made for the purchase of cans, and
addition of the canned product to the island's needed food supply.
ortage of cargo space for their sugar has added to the problems
ne cooperative Los Canos and Lafayette sugar mills, and because
riority restrictions, they have also had difficulties in obtaining
pment needed for increased operating efficiency. However, they
e done as well as could be expected, and the increased supply of
yl alcohol and acetone by the Lafayette enterprise to industries
aged in the war program is a source of real gratification.

n insular act regulating the sugar industry of Puerto Rico was
roved May 12, 1942, effective 90 days thereafter. This new law
ces the manufacture, processing, and refining of sugar in Puerto
o a public service enterprise, subject to the control of the Insular
olic Service Commission as to rates, profits, zone of operations,

It is too early to speculate as to the possible effect of this
slation on the two sugar mill cooperatives financed by the PRRA.
The Puerto Rico Rug Cooperative, which obtained an additional
n of \$10,000 in the fall of 1941, and which from October last to the
t of June this year had shipped and sold nearly 114,000 rag and
ng rugs for about \$55,500, will now have to reduce operations and
fine itself to the local market until shipping conditions are im-
oved.

An additional loan of \$75,000 was made to the Puerto Rico Cotton
owers' Marketing Cooperative in July 1941 to finance its rapidly
anding operations. For the first 5 months of the season members
the southern district of the island had already delivered to the gin
ore than twice the amount of the previous year's production, and
is expected that the northern district also will surpass all previous
ords in cotton weight and quality. The cooperative has a con-
ct with the Commodity Credit Corporation for special cotton
quired in the war program.

The Sociedad Agrícola de Puerto Rico, organized in 1939 princi-
lly to purchase farm supplies (particularly fertilizer), for members
io now number about 1,700, obtained an additional PRRA loan
\$190,000 in February 1942, partly to finance acquisition of a
emical fertilizer mixing plant, partly for necessary operating capital.

Rural Rehabilitation

No Federal funds were made available for the broad program of
ral rehabilitation which formerly had been one of the most impor-

tant PRRA activities. However, through \$81,200 appropriated to the PRRA by the insular legislature, operation of PRRA'S Central Service Farms was resumed and substantial rehabilitation work in the rural resettlement projects was continued. With emphasis on increased production of food crops on approximately 12,000 acres already in cultivation by PRRA resettlers, 500 additional acres of seedbeds were planted in bananas, plantains, yams, corn, rice, beans and various other vegetables. In a coordinated program with the Work Projects Administration, the PRRA furnished technical direction, land, work animals, agricultural implements, warehouse and other facilities, and the Work Projects Administration furnished labor, fertilizers, insecticides, etc., for planting 300 acres of seedbeds in grains and tubers to be turned over to the WPA for its planting and school-lunch programs. Like activities, including repairs and upkeep of roads, waterworks and buildings in PRRA resettlement areas, as well as operation of Central Service Farms and the furnishing of technical advice and help to resettlers in their production of food crops so badly needed in the island, will be financed during the fiscal year 1943 by \$50,000 appropriated by the insular legislature and \$82,900 approved for expenditure from the revolving fund

Conclusion

The tremendous amount of unemployment which principally motivated the establishment of the PRRA does not appear in as bold outline as it did 7 years ago, but the problem of a dense and ever-increasing population forced to wrest a livelihood, mainly by agriculture, from exceedingly limited resources, still remains. Recent financing of the PRRA and the \$1,150,380 authorized for expenditure out of the revolving fund for the fiscal year 1943 is barely sufficient temporarily to protect investments of the Government valued at approximately \$20,000,000 produced by previous PRRA programs, and to conserve some of the social and economic progress which would be completely lost if the program were entirely terminated. Unless the present Revolving Fund Act is amended by legislation (S. 1358) which has long been pending in the Senate so that receipts from projects financed out of the revolving fund (as present PRRA projects are financed), shall go back into the revolving fund, that fund will soon be exhausted. Then either the PRRA will have to be liquidated, or continuation of its most necessary activities either by the PRRA or by some other agency qualified to do the work, will have to be financed by direct Federal appropriations. It is also to be borne in mind that when the war is over, or sooner if Army and Navy projects now under way are completed, the unemployment problem somewhat alleviated by those activities, will again become

acute. Inevitably then by reason of the insufficiency of the island's peculiar economy, consideration again will have to be given as to whether mere palliative relief should be afforded, or whether in the light of the PRRA's experience, relief or other Federal expenditures should not be devoted to projects with long range reconstruction possibilities. The contributions which the PRRA has made to the development of the natural and human resources of the island, and particularly the development of more progressive leadership among those who have received its help and training, should not be allowed to go to waste.

Division of Investigations

DALE B. WHITESIDE, Director

THE Division during the fiscal year 1942 rendered substantial services in meeting requirements of our Nation at war.

Before and since Pearl Harbor, large areas of public lands in the United States and Alaska were withdrawn by Executive order, subject to valid existing rights, from all forms of appropriation under the public land laws and reserved for the use of the War or Navy Departments as bombing or gunnery ranges, or for other military or naval purposes. Such use required the clearing of title to the withdrawn areas which necessitated the checking of thousands of mining claim records and the examination of several million acres of land. In order to serve notice of the proceedings, a search was made for approximately 10,000 claimants. Numerous hearings were held in contested cases and thousands of invalid mining claims were canceled as a result of the investigations.

Services performed for the Bureau of Reclamation included the appraisal of mineral lands and the examination of mining claims within the Shasta, Keswick, and Friant Reservoirs of the Central Valley project in California, the Davis Dam project on the Colorado River, and the Colorado Big Thompson reclamation project in Colorado. Similar services were rendered in completing the remaining mineral cases affecting the Grand Coulee project in the State of Washington.

A recheck appraisal of a considerable area of privately owned lands to be purchased in connection with the Cascade Reservoir site, Idaho, was also made at the request of the Bureau of Reclamation.

The Division cooperated with the National Park Service in appraising lands to be added to parks and in investigating mining claims on park and monument lands. The work involved in clearing title to lands within the Joshua Tree National Monument in California proved to be extensive as approximately 8,750 mining claims were found of record. Adverse proceedings have been directed against 3,900 of these claims and 105 applications for hearing are pending.

number of investigations were made for the Office of Indian Affairs, including a survey to determine the grazing privilege rights of white stockmen on certain lands within the so-called Ute Extension Area within Utah Grazing District No. 8. The lands in question had been purchased by the Office of Indian Affairs in furtherance of a program to make additional areas available to Indians for grazing purposes.

A substantial part of the work of the Division continued to be the investigation of grazing lease applications and renewals, in furtherance of the program to protect and conserve the public domain. During the fiscal year 2,899 reports were submitted relating to investigations of grazing lease applications.

The following violations were investigated on which reports were submitted during the fiscal year ended June 30, 1942, for criminal prosecution:

Embezzlement.....	4
Submitting false claims against the Government.....	3
Perjury.....	4
Making false acknowledgments in certificates.....	1
Timber trespass.....	3
Grazing trespass.....	2
Forgery.....	1
Cutting witness trees at section corners.....	2
Theft of Government property.....	2
Oil and gas frauds.....	2

Nine of these violators were indicted during the fiscal year and 10 defendants, some of whom were indicted prior to July 1, 1941, were convicted.

Reorganization

By departmental order dated January 17, 1942, the Division of Investigations was reorganized. A Branch of Field Examination was established in the General Land Office to make inspections, surveys, and other field examinations. The order also established a staff of field representatives attached directly to the Office of the Secretary for the purpose of making such over-all studies and performing such field examining work for the Office of the Secretary and its various bureaus as the Secretary shall direct.

Summary

The combined units, on June 30, 1942, consisted of 115 employees, of whom 23 were on duty at Washington, D. C., and 92 in the four regional offices located at San Francisco, Calif.; Billings, Mont.; Salt Lake City, Utah; and Albuquerque, N. Mex.

Division of Personnel Supervision and Management

MRS. J. ATWOOD MAULDING, Director

THE Division of Personnel Supervision and Management has stepped into the pace set by the emergency to meet the heavy demands for the recruitment of employees created by new war activities, heavy losses by personnel transfers, decentralization of bureaus, and the replacement of men leaving for military service. Nearly 5,500 separations in the Department have been directly attributable to the war, including approximately 1,500 military furloughs.

Many positions have been filled by promotion from within the service, in accordance with the established policy, and those vacated by employees going to the armed services are, of course, filled provisionally for the period of absence. During the year the bureaus in Washington requested eligibles for 2,460 positions, and single requests for as many as 50 or more coal mine inspectors, explosives investigators, geologists, engineers, and nurses were not uncommon. Over 200 engineering aides were appointed in response to an open order from the Geological Survey. These figures do not include the great number of positions filled in the field through the offices of the district civil-service managers.

On January 1, last, the Civil Service Commission inaugurated a direct recruiting system for certain types of qualifications, and the Department has cooperated in this recruitment program. The situation with regard to stenographers and machine operators has been particularly acute, and a large number of these were secured through the direct recruitment process. There has been daily liaison with the Civil Service Commission and recently the Commission has assigned a special representative to handle our requests. There has also been close cooperation with representatives of the Commission in the negotiation of war service transfers, both to and from the Department.

Nearly 17,000 applications for employment have been rated in the Employment Section, and more than 1,000 applicants interviewed,

not including those interviewed in regard to the forthcoming centralization of the Fish and Wildlife, National Park, and Services. Of employees unable to transfer with these bureaus have been placed in other positions, and 115 persons have been recruited for the transfer.

In October 1941, the Civil Service Commission delegated to the Department the authority to approve all promotions and establish status for our own employees. In order to regulate these the Division set up and distributed to the bureaus a complete set of qualifications standards for various types of positions.

In accordance with the terms of the Ramspeck Act, there was established a Departmental Board of Review on Efficiency including one member elected by the employees. Only three appeals were received by the Board. The Department feels rather proud of this record since it indicates considerate attention on the part of rating and reviewing officers and a well functioning grievance machinery. Effective March 31, last, the Civil Service Commission prescribed a revised efficiency rating system. This was inaugurated in the Department with a course in procedures and techniques conducted for 300 officers who are responsible for rating and reviewing the work of employees. The interest shown was commendable.

An effort has been made to stimulate training of various types within the Department, especially as a method of meeting the existing shortage of available experienced personnel. The Stenographic Training Center has continued with increased attendance, but because of the mounting shortage of stenographers, the program of the Center has been curtailed. Its principal objective now is to make newly appointed stenographers acquainted as expeditiously as possible with the Interior Department and its style and form of correspondence, make-up and procedure. The short program does not provide opportunity for increasing skills in short hand and typing. An effort is made, by means of diagnostic tests, to isolate performance faults and to prescribe remedial drills.

The volume of paper work in connection with enlarged war effort and increased personnel turn-over, as well as the loss of a number of the Division's own trained persons, have made unusual demands on the Division. The volume has also been increased by the operation of the automatic promotion law, involving the processing of a large number each quarter. To meet the situation there was installed in the Appointments Section a "processing line" type of organization for speedy transit of personnel actions for signature. Conforming to the departmental policy, classification, accuracy, and complete action are now checked in one continuous procedure without a change of routing and resulting delay. During the past year, 39,675 personnel actions have been handled.

The amendment to the Retirement law on January 24, 1942, extended the benefits to practically every regular Government employee. This very desirable legislation has greatly increased the number of records maintained in the Central Office of the Department, and a large number of inquiries have been handled in recent months. During the year there have been 188 retirements—65 for age, 65 for disability, and 58 voluntary retirements before reaching the retirement age.

A comprehensive Personnel Manual bringing together all existing orders and instructions relating to personnel management in the Department was issued in December 1941. The War Service Regulations and new streamlined procedures adopted by the Civil Service Commission have made material modifications necessary, but we consider the manual a valuable aid, especially to the field officers operating at long distance. The Personnel Bulletin formerly issued semi-monthly is now issued quarterly in line with the desire to conserve labor and paper.

An Employee Handbook explaining the objectives of the Department and the regulations, rights, and privileges of employees has been issued, primarily for the benefit of new recruits, and other steps have been taken to assist new employees in making a satisfactory personal adjustment.

Office of the Solicitor

NATHAN R. MARGOLD, Solicitor ¹

WITH the mobilization of the Nation's vast resources on a war-time basis there devolved upon the Office of the Solicitor, the bureau counsel, and field attorneys, a correspondingly heavy burden of complex, controversial, and unique legal questions. The necessity for developing and making immediately available all of the Nation's resources, without delay to the war program, within the framework of the law, with due regard for individual rights and with a minimum of interference with long-established conservation policies and programs, created many complex legal problems and presented many legal obstacles requiring resourceful, expeditious counsel.

Shortly after the start of hostilities with Japan, it became important to determine what measures would be necessary not only to protect American and Philippine currency and securities in the hands of United States citizens and nationals but also to prevent the use of such currency and securities which might be in or which might fall into the hands of the enemy or enemy agents here and abroad. After intensive study of the United States and Philippine laws involved, especially with respect to Philippine credits in the United States, and following conferences with the representatives of the Treasury Department and of the Commonwealth of the Philippines, measures were devised to accomplish the desired objectives and these measures were successfully carried into effect by the appropriate civil and military authorities. Similarly, the same subject has been studied with respect to currency and securities in other areas, as a result of which instructions have been issued by the Treasury Department providing adequate safeguards and machinery for the registration, custody and, if necessary, the destruction of securities and currency in the event of invasion of such areas.

One of the important laws enacted by the Congress during the year directly affecting the Department was the Federal Explosives Act of

¹ Mr. Margold terminated his service as Solicitor on July 9, 1942, to become an Associate Judge of the Municipal Court for the District of Columbia. Felix S. Cohen served as Acting Solicitor until August 26, when Warner W. Gardner was inducted into office as Solicitor.

September 26, 1941. This is a revision of the 1917 wartime explosives act and was drafted by the Solicitor's Office during the preceding fiscal year. It provides the necessary authority and machinery for the exercise of Federal licensing and control of the manufacture, distribution, storage, use and possession of explosives in time of war or national emergency and is designed to prevent the misuse of explosives by restricting their use and possession to reliable, experienced and loyal persons and their proper concerns. Regulations and licensing procedures implementing the provisions of the act were devised and prepared by attorneys of the Solicitor's Office, and promulgated with their assistance. The decision of the commanding general of the Pacific coast area to evacuate all persons of Japanese descent from within certain limits of the coastal zone to relocate them on Government land removed from possible enemy attack zones resulted in a series of agreements between the War Relocation Authority and the Department of the Interior. Thousands of acres of the public domain were required for this purpose and both the Bureau of Reclamation and Indian lands have been made available to the War Relocation Authority for the construction of housing facilities, the establishment of self-governing communities under Federal supervision and for farming and industrial purposes. Agreements have been negotiated and methods devised whereby the Bureau of Reclamation will supply these wholly unique projects with water and electric power for domestic and commercial purposes; it also will construct irrigation works and provide the necessary facilities and equipment. Cooperative agreements between the agencies affected, and with the Indians, provide for the utilization of Indian lands without extinguishment of the Indian title to such land or the transfer of title to any other grantee. Not only will the Indian owners receive money rental, but also any improvements made upon the land will accrue to their benefit. At least 30,000 evacuees will be relocated on the Klamath, Minidoka, and Shoshone sites, on lands of the Bureau of Reclamation; at least 20,000 on the Colorado River Indian Reservation and an additional 10,000 on the Gila River Indian Reservation. With the rapid development of the war program and the tremendous expansion of the armed forces it became necessary to make available to the Army, Navy, and Marine Corps millions of acres of public land for immediate use as bombing and gunnery ranges, antiaircraft ranges, training and recreation areas, and combat bases, and for other military purposes. Lands already withdrawn and dedicated to a particular use were also made available for military purposes by the Solicitor's Office, Bureau of Reclamation, National Park Service and Fish and Wildlife Service. The orderly, legal, and expeditious disposition of the lands so required presented a variety of novel legal problems. Many apparent obstacles had to be overcome and prac-

tical methods devised—consistent with existing law and the emergency presented.

An important decision concerning the validity of 174 mining claims situated in the area set aside for the use of the War Department as the Muroc Bombing and Gunnery Range, California, was rendered, thereby expediting the availability of the area for military use.

Greatly increased demands upon the Bureau of Mines by the Navy Department for helium gas necessitated the consideration of many intricate legal problems in passing upon the validity of title to easements, rights-of-way and plant sites, and in the preparation of contracts for the acquisition of such lands. A recent appropriation of 4 million dollars, to enable the Bureau of Mines to expand its program to meet the war requirements for helium will, necessarily, result in a marked increase in the legal work in connection therewith.

Rights asserted by private individuals under applications filed pursuant to the sodium provisions of the mineral leasing act to salt deposits in the Death Valley National Monument, California, needed for Federal use in connection with the production of magnesium, and private rights sought to be created by locating mining claims under the United States mining laws for Government-owned sand and gravel in Nevada, needed in the construction of Federal defense plants and housing, were held to be without force and effect.

Yucca, a plant found on the public domain and needed in the prosecution of the war as a substitute for certain strategic or critical materials formerly imported from abroad, was made available for appropriate disposition under authority vested in the Secretary of the Interior by Executive Order No. 9180, of June 5, 1942, issued pursuant to the President's war powers.

Hundreds of legislative matters were presented, vitally affecting the prosecution of the war. Legislation pertaining to the sudden development of the Nation's mineral resources, the rapid expansion of industrial operations and the resultant demand for increased power facilities in the Pacific Northwest; problems in connection with the use of public lands by the Army, Navy, and Marine Corps, especially by the air arms of the services; questions affecting an important source of food supply, the commercial salmon fisheries of Alaska and the Pacific Northwest, and many others, required extensive legal consideration.

A substantial portion of the legal work performed during the fiscal year affecting the Division of Territories and Island Possessions concerned matters directly or indirectly connected with the prosecution of the war. Examples of such matters are: Proposed legislation to provide protection for persons and property in the Territories and possessions against bombing attacks; authorizing the planting of guayule for the production of a domestic rubber supply; authorizing expenditures for evacuating dependents of civilian employees in the

territories and possessions; to permit censorship of communications and between the Territories and possessions; to provide benefits for injury, disability, death, or detention of civilians; questions concerning the filing of income-tax returns and the payment of the tax for persons in the Territories and possessions affected by the war; extension to officers in the Territories of emergency powers with respect to the making and modification of contracts; contracts, leases, and other questions regarding relief and civilian defense in the Territories and possessions; questions regarding shipping rates and fire insurance on shipments to the Territories and possessions; proposed legislation establishing a military code for Alaska; question regarding construction of a military highway to Alaska; orders for the extension of toll charges on shipments over the Richardson Highway for war projects; proposed legislation for the employment of natives on war projects in Hawaii; questions concerning the appointment of nonresident police officers in Hawaii to provide protection for vital facilities; questions concerning the payment of expenses of the Hawaiian home guard; questions as to civil jurisdiction in the naval base at San Juan; questions regarding the sugar quota and the suspension of quotas under the sugar act; Executive order certifying Puerto Rico as a distressed emergency area; questions regarding applicability of Selective Service Act in the Virgin Islands; Executive order transferring property in the Virgin Islands to the Navy Department; contract between the War Department and The Virgin Islands Co. for constructing distribution facilities supplying power in connection with Benedict Field, St. Croix, Virgin Islands.

The most important patent case arose during the fiscal year covering the use of new and useful means of extinguishing magnesium incendiary bombs by the application of feldspar. Manufacture and sale of the extinguisher is permitted under regulations which were drafted in order to insure availability of the product at low cost, honestly priced, and which prevent, insofar as possible, monopolistic practices.

During the fiscal year the office was required to pass upon many involved legal problems and to devise methods for the expeditious acquisition of Indian lands, resources and facilities necessary or desirable in the furtherance of the war program, including the production of strategic minerals, the marketing of commercial timber, increased grain and other food production, including forage for livestock on Indian lands, tribal or allotted, and acquisition by the military forces—Army, Navy and Air—of needed areas of Indian lands. A number of legal matters affecting the prosecution of the war were presented in connection with the activities of the Grazing Service, of which the following are examples: analyzing the means of providing recreational areas for civilian and armed war forces;

analyzing legal aspects of access-road problems, and facilitating drawals for bombing, aerial gunnery or chemical warfare; facilitating transfer of Grazing Service equipment needed by armed forces or for other direct war work.

The number of items presented to the Counsel at Large-Territory of Alaska was 781, many of which directly relate to prosecution of the war.

Legal questions arising in the Bureau of Reclamation during fiscal year 1942 were largely concentrated on activities relating to prosecution of the war. Contracts were drafted and negotiated for supplying power from the Boulder Canyon project and other reclamation projects to vital war industries. Legal arrangements were made for furnishing water for war industries, for military camps and training centers. Land acquisitions required in the construction of war-producing projects were expedited. Authority under the War Relocation Act was utilized to expedite construction of power producing projects such as Central Valley and Colorado-Big Thompson. Requests of the War Department and other war agencies for lands, rights, and equipment necessitated the preparation and negotiation of numerous leases and sale contracts. The irrigation program, of importance in furnishing food, forage and fiber essential to the successful prosecution of the war, continued to present the usual volume of difficult legal problems.

During the course of the year the Solicitor, or members of his staff, appeared before the courts in behalf of the Secretary of the Interior and other officers in many matters affecting the Department. Attorneys assigned to the immediate office, as well as bureau counsel and attorneys in the field, actively participated in the preparation of cases, in cases referred to the Department of Justice and, in many cases, cooperated with attorneys of that Department in the actual presentation and trial of cases. The two most important cases decided during the year were those argued by the Solicitor before the United States Supreme Court, in each of which the position taken by the Department was upheld. The decisions in these two cases, *United States v. Fe Pacific Railroad Co.* (Walapai case), and *State v. Sampson*, climaxed a record commenced in March 1933 in which the Department has been successful in every case before the high court where the validity of departmental action by this Administration has been challenged. The unanimous decision of the Supreme Court in the Walapai case affirms the possessory rights of the Indians in lands to which they have occupied from time immemorial, even where title to such lands has been granted to a railroad. The Sampson case affirms the sanctity of Indian treaties and denies the contention that such rights must yield to State laws; it is expected to have a far-reaching influence in the interpretation of Indian treaties where they deal with fishing rights in the Northwest. These two ex-

to a sweeping and significant victory for a minority people against the claims of a dominant majority, and are evidence of the sacredness with which the United States upholds its obligations toward the aboriginal owners of the continent.

Other litigation of particular interest included the cases of *Dow v. United States* and *Gilbert v. Ickes*, which were finally determined in favor of the Secretary of the Interior by the Court of Appeals for the District of Columbia, the United States Supreme Court denying certiorari. In the two cases were attempts to compel the Secretary to modify certain provisions of the Alaska Fisheries regulations. Certiorari was also denied by the Supreme Court in the case of *United States v. General Petroleum Corporation of California*, 125 F. (2d) 928, where the Circuit Court of Appeals for the Ninth Circuit upheld the position of the Department with reference to a regulation by the Seneca Tribal Council canceling some 800 leases in the town of Salamanca on the Allegany Indian Reservation. In the case of *United States v. General Petroleum Corporation of California*, which is presently in the course of trial, the United States is seeking an accounting of over 3 million dollars in oil royalties alleged to be due on account of oil and gas produced and sold from Federal lands. It also seeks to establish the authority of the Secretary of the Interior to fix, pursuant to the Mineral Leasing Act of February 25, 1920, reasonable minimum valuations for the purpose of computing royalty due the United States. Other cases either handled or participated in by the Department's attorneys include: *Nebraska v. Wyoming*, *Colorado v. United States, Intervener*, pending in the Supreme Court of the United States; *United States v. Orr Water District*, and *United States v. Alpine Land & Reservoir Co.*, pending in the United States District Court for the District of Nevada, in which the United States is asking, among other things, to establish the ownership of unappropriated water of nonnavigable streams. Important questions of law concerning the valuation of reservoir and power sites are involved in the case of *United States v. Washington Power Co.*, pending on appeal in the United States Supreme Court. A decision in favor of the United States in the United States District Court of Appeals for the Ninth Circuit, and *United States v. Bend Transit Co.*, pending in the United States District Court for the District of Washington.

The preparation of opinions, decisions and legal memoranda constituted a very important part of the work of the Solicitor's Office, and during the year more than 600 opinions and over 3,000 memoranda on matters requiring legal interpretation were prepared and disposed of. The problems presented involved matters of vital concern to the efficient and lawful administration of the affairs of the Department. As has been indicated, included many unique problems growing out of the war program.

The regulation of the fishing industry in Alaska and certain bills pending before the Congress seeking to revise the laws regulating the

commercial fisheries of Alaska and the Pacific salmon fishery have invoked numerous legal and administrative problems. The legislation necessitated extensive analysis with respect to the significance and implications of the proposed changes in the law and several important memoranda were prepared in respect thereto. One important opinion held that the Secretary of the Interior has authority to limit the number of salmon traps which may be occupied in the territorial waters of Alaska on an individual, concern or combination. The annual revision of the Alaska Fisheries regulations also required the preparation of opinions by the Solicitor to the Secretary with respect to the original occupancy rights of Alaska Indians in the light of the decision in the Walapai case and, among other things, it was decided with respect to areas which may be shown to have been subject to aboriginal occupancy, fish trap site locations in Alaskan waters not be closed to Indians in contravention of established Indian rights.

The revision and preparation of the new Federal Range Code of the Conservation Division of the Solicitor's Office, in consultation with the Acting Chief Counsel of the Grazing Service, was a matter of paramount importance. The new code reflects the policy of the Department in the regulation of the range since the passage of the Taylor Grazing Act; it clarifies and develops the provisions of the existing code in accordance with the experience of users of the range; its provisions represent a practical, conservative attempt to assure the orderly, efficient utilization, development and preservation of the vast grazing resources of the Nation.

Approximately 170 laws directly affecting the Department of the Interior were enacted during the fiscal year. The nature and scope of the subjects covered is indicated by the following list of the more important statutes enacted during the year:

Public, No. 539 (H. R. 6020).—Granting the consent and approval of the United States to an interstate compact relating to the better utilization of the fishery resources (including shell and anadromous) of the Atlantic seaboard and creating the Atlantic Marine Fisheries Commission.

Public, No. 151 (S. 178).—Authorizing the Secretary of the Interior to grant oil and gas leases on certain lands.

Public, No. 586 (H. R. 5394).—To authorize the lease or sale of public lands for use in connection with the manufacture of arms, ammunition, and explosives of war, and so forth.

Public, No. 381 (H. R. 3019).—To amend the act entitled "An act to regulate the manufacture, distribution, storage, use, and possession in time of war of explosives, providing regulations for the safe manufacture, distribution, use, and possession of the same, and for other purposes," approved July 1917 (40 Stat. 385).

Public, No. 624 (S. 2066).—To make permanently effective the act to regulate interstate and foreign commerce in petroleum and its products.

Public, No. 197 (H. R. 4816).—To facilitate the construction, extension, and completion of interstate petroleum pipe lines related to national defense and to promote interstate commerce.

Public, No. 356 (H. R. 4854).—To facilitate and simplify the administration of the Federal Reclamation laws and the act of August 11, 1939, as amended.

Public, No. 214 (S. 173).—To amend section 61 of the National Defense Act of June 3, 1916, as amended, for the purpose of extending to Hawaii, Alaska, Puerto Rico, and the Canal Zone the permission to organize military units not a part of the National Guard which was granted to the States by the amendment made to such section by the act of October 21, 1940.

Public, No. 392 (H. R. 5822).—To establish a military code for the Territory of Alaska.

Public, No. 586 (H. R. 5394).—To authorize the lease or sale of public lands for use in connection with the manufacture of arms, ammunition, and implements of war, and so forth.

The reorganization of the legal work of the Department, which has been in the process of development during the past two fiscal years, has resulted in a substantial drop in the numerical volume of routine matters passing through the immediate office, in the elimination of considerable duplication of effort, and in the saving of much time formerly expended in routine review. Final disposition by bureau counsel of numerous classes of matters susceptible of determination at the bureau level, and the institution of the divisional system in the immediate Office of the Solicitor, whereby responsibility for final disposition of certain matters has been vested in the division chiefs, have made it possible for the Solicitor to devote his personal attention more fully to matters presenting legal questions of first impression or of sweeping significance.

The volume of legal work moving through the immediate Office of the Solicitor is indicated by the following table which shows the number of recorded items passed upon during the fiscal year 1942:

Requests for Solicitor's opinions.....	604
Legal memoranda and correspondence.....	3, 008
Legislative matters.....	1, 705
General Land Office matters.....	5, 834
Geological Survey.....	178
Bureau of Mines.....	1, 604
Petroleum Conservation Division.....	34
War Minerals Relief Commission.....	12
Grazing Service.....	178
Office of Indian Affairs.....	9, 801
Bureau of Reclamation.....	175
National Park Service.....	721
Division of Territories and Island Possessions.....	104
Division of Investigations.....	88
Fish and Wildlife Service.....	167
Bituminous Coal Division.....	31
Matters handled by Counsel at Large, Alaska.....	775
Construction and supply contracts.....	134
Miscellaneous matters.....	113
Total.....	25, 266

In addition to the matters directly passed upon in the immediate Office of the Solicitor, a much larger number of matters were disposed

of by the attorneys who, while acting under the supervision of the Director, are directly attached to the various bureaus of the Department.

The office of the Chief Counsel, National Park Service, handled approximately 20,000 matters during the fiscal year and it is estimated that at least 3,000 matters were handled in the field. It was necessary to draft many agreements and to revise various regulations to facilitate the means whereby the Army has been able to use lands under the jurisdiction of the Park Service for camp sites and for military purposes.

The Office of the Chief Counsel of the Fish and Wildlife Service handled approximately 2,400 cases or items which required review or the preparation of appropriate opinions, documents, or papers. The matters referred to this office cover a wide field of problems arising in connection with the administration of the Migratory Bird Treaty Act, the Migratory Bird Conservation Act, and several acts relating to the Alaska commercial fisheries, the Game Law, and a number of laws specifically applicable to certain areas or certain species of wildlife. Functions and duties of the Fish and Wildlife Service with respect to the administration of the commercial fisheries and with respect to investigations and recommendations concerning the commercial fisheries have a direct bearing on the war program.

The volume of public-land litigation and trespass work in the Division of the General Land Office increased substantially during the fiscal year 1942. Sixty-five cases were referred to the Department of Justice for appropriate action resulting in the collection of \$205.13, as compared with 31 cases and \$47,347.52 collected during the preceding year. The sum of \$35,979.17 was collected in settlements of trespass on the public lands by administrative proceedings conducted under the supervision of the Law Division as compared with \$477.50 collected during the preceding year. In the aggregate the Law Division of the General Land Office during the fiscal year received, considered, and disposed of a total of 42,055 items.

During the fiscal year 1942 the legal staff of the Geological Survey disposed of approximately 2,880 diversified matters. The work related primarily to mineral leasing operations, chiefly to oil and gas. Unit plans submitted pursuant to existing statutes necessitate considerable legal attention. At the present time unitized operations govern the recovery of 46 percent of all crude oil and 56 percent of gas produced from public lands. Legislative reports were prepared in connection with several mineral bills designed to promote the utilization of the natural resources of the Nation.

The entire legal set-up of the Solicitor's Office was seriously handicapped by a substantial turn-over of the legal staff, caused by furloughs and transfers of experienced personnel to important positions in other agencies engaged in war activities.

Division of Information

MICHAEL W. STRAUS, Director

HAVING adjusted its activities to meet national emergency conditions well in advance of the formal declaration of war, the Division of Information was able to render effective aid during the past fiscal year by promoting popular understanding of the problems and aims of the Department in carrying forward the mobilization of the Nation's natural resources for victory.

The swift transition from the peacetime field of conservation operations to that of war endeavor was accompanied by drastic steps in the curtailment of expenditures. Sharp economies in the use of postal facilities and paper supplies essential to the war were put into effect. As early as October 1941, mailing lists hitherto maintained in accordance with written requests from the public for information on conservation progress were scrapped for the duration of the war. Publication of the monthly clipsheet *Current Conservation* was suspended. Other publications of the Department and its agencies were either discontinued or their distribution sharply restricted. Dissemination of information through press releases was generally limited to essential subjects connected with the war program.

Discontinuance of these nonwar activities, however, brought no diminution in the volume of tasks and responsibilities placed upon the division with its establishment by Congress in 1938; it merely shifted its objectives from peacetime to war problems. After Pearl Harbor, the Director served as Director of the Department of the Interior War Resources Council, and the Division was called upon to assist in the preparation and distribution of information material setting forth the Department's war program for the mobilization of metals, oil, power, fuel, helium, food, land, water, and timber for war purposes.

During the course of the year, enactment by Congress of the Mine Safety Act, containing specific directions for publication of findings brought additional responsibilities to the Division. Facilities of the Division were opened to the Office of Petroleum Coordinator for War, and a heavy volume of material was handled for that organization. Likewise, new activities were created for the Division by placing of the Office of Solid Fuels Coordinator for War under the leadership of

of by the attorneys who, while acting under the supervision of the Solicitor, are directly attached to the various bureaus of the Department.

The office of the Chief Counsel, National Park Service, handled approximately 20,000 matters during the fiscal year and it is estimated that at least 3,000 matters were handled in the field. It was necessary to draft many agreements and to revise various regulations to facilitate the means whereby the Army has been able to use areas under the jurisdiction of the Park Service for camp sites and other military purposes.

The Office of the Chief Counsel of the Fish and Wildlife Service handled approximately 2,400 cases or items which required legal review or the preparation of appropriate opinions, documents, or other papers. The matters referred to this office cover a wide field of legal problems arising in connection with the administration of the Migratory Bird Treaty Act, the Migratory Bird Conservation Act, and the several acts relating to the Alaska commercial fisheries, the Alaska Game Law, and a number of laws specifically applicable to certain areas or certain species of wildlife. Functions and duties of the Fish and Wildlife Service with respect to the administration of the Alaska commercial fisheries and with respect to investigations and recommendations concerning the commercial fisheries have a direct relation to the war program.

The volume of public-land litigation and trespass work in the Law Division of the General Land Office increased substantially during the fiscal year 1942. Sixty-five cases were referred to the Department of Justice for appropriate action resulting in the collection of \$65,205.13, as compared with 31 cases and \$47,347.52 collected during the preceding year. The sum of \$35,979.17 was collected in settlement of trespass on the public lands by administrative proceedings conducted under the supervision of the Law Division as compared with \$27,477.50 collected during the preceding year. In the aggregate, the Law Division of the General Land Office during the fiscal year 1942 received, considered, and disposed of a total of 42,055 items.

During the fiscal year 1942 the legal staff of the Geological Survey disposed of approximately 2,880 diversified matters. The work related primarily to mineral leasing operations, chiefly to oil and gas. Unit plans submitted pursuant to existing statutes necessitated considerable legal attention. At the present time unitized operations govern the recovery of 46 percent of all crude oil and 56 percent of all gas produced from public lands. Legislative reports were prepared in connection with several mineral bills designed to promote the utilization of the natural resources of the Nation.

The entire legal set-up of the Solicitor's Office was seriously handicapped by a substantial turn-over of the legal staff, caused by military furloughs and transfers of experienced personnel to important positions in other agencies engaged in war activities.

Division of Information

MICHAEL W. STRAUS, Director

HAVING adjusted its activities to meet national emergency conditions well in advance of the formal declaration of war, the Division of Information was able to render effective aid during the past fiscal year by promoting popular understanding of the problems and aims of the Department in carrying forward the mobilization of the Nation's natural resources for victory.

Division of Information

MICHAEL W. STRAUS, Director

HAVING adjusted its activities to meet national emergency conditions well in advance of the formal declaration of war, the Division of Information was able to render effective aid during the past fiscal year by promoting popular understanding of the problems and aims of the Department in carrying forward the mobilization of the Nation's natural resources for victory.

The swift transition from the peacetime field of conservation operations to that of war endeavor was accompanied by drastic steps in the curtailment of expenditures. Sharp economies in the use of postal facilities and paper supplies essential to the war were put into effect. As early as October 1941, mailing lists hitherto maintained in accordance with written requests from the public for information on conservation progress were scrapped for the duration of the war. Publication of the monthly clipsheet *Current Conservation* was suspended. Other publications of the Department and its agencies were either discontinued or their distribution sharply restricted. Dissemination of information through press releases was generally limited to essential subjects connected with the war program.

Discontinuance of these nonwar activities, however, brought no diminution in the volume of tasks and responsibilities placed upon the division with its establishment by Congress in 1938; it merely shifted its objectives from peacetime to war problems. After Pearl Harbor, the Director served as Director of the Department of the Interior War Resources Council, and the Division was called upon to assist in the preparation and distribution of information material setting forth the Department's war program for the mobilization of metals, oil, power, fuel, helium, food, land, water, and timber for war purposes.

During the course of the year, enactment by Congress of the Mine Safety Act, containing specific directions for publication of findings brought additional responsibilities to the Division. Facilities of the Division were opened to the Office of Petroleum Coordinator for War, and a heavy volume of material was handled for that organization. Likewise, new activities were created for the Division by placing of the Office of Solid Fuels Coordinator for War under the leadership of

Secretary Ickes. The Division's duties subsequently were increased by the establishment of the Office of Fishery Coordinator by Executive Order.

In meeting these responsibilities, the Division issued a total of 342 press releases during the year. The increase of 342 over the previous fiscal period represented in large measure the volume of information material made mandatory under the Mine Safety Act.

Maintaining the organization authorized by Congress, the Division of Information consists of an editorial branch, a radio section, a photographic section, and a publications section.

Radio Section

The facilities of the Radio Section were shared by the Department of the Interior throughout the year with other agencies of the United States and of foreign governments in the dissemination of information concerning the United Nations' war activities. Operating one of the best equipped broadcasting and recording studios in the country, the Radio Section rendered full cooperation in the preparation of programs which, since the Studio maintains no transmitting equipment of its own, were broadcast through the cooperation of commercial radio stations of the United States.

Among the governmental agencies utilizing the services of the Radio Section during the year were the Army and Navy, the Office of Emergency Management, Office of War Information, War Production Administration, Office of Facts and Figures, Office of the Coordinator of Information, Office of the Coordinator of Inter-American Affairs, United States Maritime Commission, War Manpower Commission, Department of Agriculture, and the United States Public Health Service.

Several hundred programs were prepared for the United States Army and Navy for use in special training work.

In addition to its work in preparing programs for these agencies, the section also produced programs in various languages and presented important speakers for shortwave broadcasts, at the request of the Office of Coordinator of Information and the Office of War Information.

In the past year, more than 250 programs concerned with the activities of the Department of the Interior were prepared by the Radio Section. Time for these programs was made available at no cost by major networks and by local radio stations throughout the country. All in all, a total of over 2,500 stations used these programs from the Department of the Interior, representing a total number of air presentations of over 3,300.

Photographic Section

During the 1942 fiscal year, the photographic laboratories and facilities of this section enabled the Department to carry out its program of

Division of Information

MICHAEL W. STRAUS, Director

HAVING adjusted its activities to meet national emergency conditions well in advance of the formal declaration of war, the Division of Information was able to render effective aid during the past year by promoting popular understanding of the problems and of the Department in carrying forward the mobilization of the nation's natural resources for victory.

The swift transition from the peacetime field of conservation rations to that of war endeavor was accompanied by drastic changes in the curtailment of expenditures. Sharp economies in the use of postal facilities and paper supplies essential to the war were put into effect. As early as October 1941, mailing lists hitherto maintained in accordance with written requests from the public for information on conservation progress were scrapped for the duration of the war. Publication of the monthly clip-sheet *Current Conservation* was suspended. Other publications of the Department and its agencies were either discontinued or their distribution sharply restricted. Maintaining the organization authorized by Congress, the Division of Information consists of an editorial branch, a radio and photographic section, and a publications section.

Radio Section

The facilities of the Radio Section were shared by the Department of the Interior throughout the year with other agencies of the United States and of foreign governments in the dissemination of information concerning the United Nations' war activities. Operating one of the best equipped broadcasting and recording studios in the country, the Radio Section rendered full cooperation in the preparation of programs which, since the Studio maintains no transmitting equipment of its own, were broadcast through the cooperation of commercial radio stations of the United States.

Among the governmental agencies utilizing the services of the Radio Section during the year were the Army and Navy, the Office of War Relocation Administration, Office of War Information, War Production Administration, Board of War Relocation, Office of Facts and Figures, Office of the Coordinator of Information, Office of the Coordinator of Inter-American Affairs, United States Maritime Commission, War Manpower Commission, Department of Agriculture, and the United States Public Health Service.

Several hundred programs were prepared for the United States Army and Navy for use in special training work.

In addition to its work in preparing programs for these agencies, the section also produced programs in various languages and presented important speakers for shortwave broadcasts, at the request of the Office of Coordinator of Information and the Office of War Information.

In the past year, more than 250 programs concerned with the activities of the Department of the Interior were prepared by the Radio Section. Time for these programs was made available at radio's major networks and by local radio stations throughout the country. All in all, a total of over 2,500 stations used these programs from the Department of the Interior, representing a total number of presentations of over 3,300.

Photographic Section

During the 1942 fiscal year, the photographic laboratories and facilities of this section enabled the Department to carry out its program

aiding service for all its bureaus and agencies, as well as furnish photographic illustrations pertaining to its varied activities to the press and other publications. This work included the furnishing of illustrative material for textbooks, guidebooks, pamphlets and travel literature requested by many types of educational, technical and scientific magazines.

Outstanding photographic projects of the year included field work in a number of western national parks and national monuments, and a photographic study of the work of the Office of Land Utilization in the western States. During a visit of members of the Argentine Congress to the United States in April, a departmental staff photographer was assigned to accompany this group on its tour, under the direction of the Office of the Coordinator of Inter-American Affairs.

In addition to its work for the various bureaus and agencies of the Department, the laboratories and equipment of the Photographic Division were made available to outside governmental agencies for the production of material involved in their war programs.

Motion-picture activities were drastically curtailed during the year through the relinquishment of the motion-picture laboratory space to the War Department for its use in connection with the preparation of special training films for use in the armed forces and other branches of the Department. Nevertheless, the section collaborated in the production of a series of 12 motion-picture films with Spanish and Portuguese subtitles for circulation in South American countries, at the request of the Division of Cultural Relations of the Department of State.

Publications Section

A streamlined procedure to promote speed and efficiency in the production of printed information essential to the war was put into effect during the past year by the Publications Section, which serves as the liaison agency between the Department of the Interior and the Government Printing Office. A production control system was instituted to insure early delivery of technical bulletins, pamphlets, statistical data, maps, charts, etc., required by the war agencies of the Interior and other departments.

At the same time, drastic curtailment was brought about in the advance and distribution of informational material not essentially concerned with the war, through a revision of the publication programs of the various bureaus and a sharp revision of mailing lists maintained by the Department.

Substantial progress toward further economy in departmental printing costs was accomplished by the preparation of standard forms for handling routine administrative matters, and the adoption of steps for the conservation of paper supplies.

Board on Geographical Names

GEORGE C. MARTIN, *Executive Secretary*

THIS Board is official authority on use of geographic names by the Federal Government. It decides unsettled questions on form, spelling, or application of names for use on maps and charts and in publications by the Government, and considers new names proposed by Government officers. The Board also serves as informal authority in non-Government use of place names and gives information on names, and on location and identity of little known places, on request from Government and other sources as far as facilities permit.

The Board consists of an advisory committee in which the Government and some geographic societies are represented, which acts chiefly by its executive committee, and of an administrative and investigative unit, the Division of Geographic Names, in the office of the Secretary of the Interior. The advisory committee, June 30, 1942, included:

W. L. G. Joerg, National Archives (chairman); Lt. Comdr. K. T. Adams, Coast and Geodetic Survey; Roscoe E. Baber, Government Printing Office; Clarence Batschelet, Bureau of the Census; James M. Darley, National Geographic Society; E. E. Carter, Forest Service, Department of Agriculture; William J. Dixon, Post Office Department; Capt. Walter F. Jacobs, Hydrographic Office, U. S. Navy; Col. Lawrence Martin, Library of Congress; W. C. Mendenhall, Geological Survey, Department of the Interior; Raye R. Platt, American Geographical Society of New York; Mrs. Sophia A. Saucerman, Department of State; John R. Swanton, Bureau of American Ethnology; and Frank E. Williams, Geographical Society of Philadelphia.

The Advisory Committee held one meeting during the year. The Executive Committee held 16 meetings at which 444 names were approved. Decisions on those names will be included in a pamphlet entitled "Decisions of the U. S. Board on Geographical Names Rendered Between July 1, 1941, and June 30, 1942," which can be obtained from the Board without charge when published.

The location by geographic units of the approved names and the

number in each were: Minnesota 106, Alaska 56, California 40, Oregon 38, Washington 25, Texas 24, Louisiana 22, North Carolina 22, Florida 19, Arizona 16, Massachusetts 14, New York 8, Montana 7, Vermont 7, Colorado 5, Mississippi 5, Alabama 4, Connecticut 4, Maryland 4, Idaho 3, Virginia 3, Bahama Islands 2, North Carolina-Tennessee 2, Utah 2, Delaware 1, Georgia (Russia) 1, Hawaii 1, Maine 1, South Carolina 1, Tennessee 1.

The sources of requests for decisions and the number from each source were: Coast and Geodetic Survey 188, Forest Service 153, Geological Survey 59, War Department 18, Office of Indian Affairs 15, National Park Service 5, State organizations 4, Bureau of Reclamation 1, Library of Congress 1.

Interior Department Museum

H. L. RAUL, Museum Curator

SINCE Pearl Harbor the attendance in the museum has largely increased due to the influx to the National Capital of servicemen and new Government workers recruited throughout the Nation. These visitors find in the Interior Department Museum a graphic visualization, carefully designed and presented by methods easily understood, of the history, aims, and the current activities of the Department.

During the past year, approximately 55,000 persons visited the museum and visitors from all of the States in the Union were recorded in the Visitors' Register. Registrations were received also from Alaska, the Canal Zone, Puerto Rico, Hawaii, and the Philippine Islands; also from Argentina, Australia, Bolivia, Brazil, Canada, China, Costa Rica, Dominican Republic, England, France, Mexico, Soviet Union, and Uruguay.

Recent additions and improvements have greatly enhanced the popularity of the museum. Pursuant to the order of the Secretary placing the Department on a war basis, the museum has been augmented with new exhibit features reflecting the intensified and enlarged activities of the Bureaus in fields vital to winning the war. Eight panels based on the war program are shown in appropriate Bureau galleries under the following title labels: The War Program of the Department of the Interior; Metals for War; Oil for War; Power for War; Fuel for War; Helium for War; Food for War; Land, Water, Timber for War. An illuminated pedestal case, with changing transparencies, and label text emphasizing the war importance of every Bureau, has been installed at the museum entrance.

A first-aid animated diorama demonstrating the Schafer prone pressure method of artificial respiration, as taught by the Bureau of Mines, has been installed for public information as well as to assist the first-aid classes which for months have been meeting in the museum. A new exhibit, How to Deal With an Incendiary Bomb, has been installed. This exhibit shows a full-size incendiary bomb model and cross section with instructions for rendering the effect of

the bomb harmless. A new exhibit pertains to the Coal-Mine Inspections Act under which the Bureau of Mines makes inspections and investigations in coal mines; another exhibit explains the amended explosives act governing the licensing, by the Bureau of Mines, of the manufacture, possession, sale, purchase, and use of explosives.

In the interest of safety, many rare and original historical documents displayed in the museum are now provided with replacement photostat facsimiles.

During the past year the museum educational facilities were augmented by the installation of three picture projection devices. A silent motion picture projector shows first-aid and other departmental films. A motion picture cabinet with sound is in operation showing important departmental films. The cabinet has been allocated to the museum through the cooperation of the Bureau of Reclamation, Fish and Wildlife Service, National Park Service, and the Bonneville Power Administration. An automatic slide projector with changing series, 70 slides to each program, also features departmental activities. By order of the Secretary, a similar projector is maintained by the museum as an extension service for servicemen at the National Capital Service Men's Club in Washington.

Upon request the museum furnished Princeton University with exhibits for use in the university defense course on military planning and construction and the emergency war course on photogrammetry. Assistance in scale-model and camouflage techniques was rendered by the museum to the Army. In addition, the museum during the year complied with various requests from the Navy Department, the Department of Agriculture, the Pan American Union, and other agencies.

Special attention has been given to revisions and additions to the standing exhibits of the several Bureaus transferred to other cities. It is realized that with the decentralization of Bureaus to locations distant from Washington, the Interior Department Museum has an increased responsibility in making available to the public a visual representation of the Bureau's activities during their absence from the National Capital.

During the year many display cases were redesigned or amplified, and the Fish and Wildlife Service Exhibit Gallery, comprising 10 display cases and 7 wall niches, was installed. To meet a need of visiting students of Government procedures, this new gallery was especially designed to explain in full detail how the actual organization of a Bureau is accomplished and how its work is performed in all its functional and regional activities.

The museum cooperated with the Bureau of Reclamation and the Television Program Department of the Columbia Broadcasting System in supplying museum exhibit materials for program use.

This marked the first time that exhibit materials of the museum have been shown by telecast and suggest interesting future possibilities.

Among the accessions acquired during the year are included additional 512 specimens of the Gibson Collection of Indian materials, purchased by order of the Secretary, 1936, transferred to the National Park Service to the custody of the museum. These specimens complete the Gibson collection, being supplemental to the materials exhibited in 25 display cases located in the main alcoves. Another important acquisition is the Fish and Wildlife Service Fuertes Collection, consisting of 50 original paintings in color of Birds Common to the United States by Louis Agassiz Fuertes. Five additional old and rare books on fishes and fisheries have been added to the rare book collection placed in the custody of the museum. Two large silhouettes entitled "The Opening of the War" and "Modern Surveying," were designed and installed in the General Office Gallery. A colorful and outstanding new exhibit is a war drum used in the ceremonies of the Iroquois Indian Confederacy in declaring war upon the Axis nations. Also included are dioramas, display cases and other exhibit materials.

During the past year 5 special exhibits were prepared and displayed by the museum in collaboration with the Bureaus, featuring the following subjects: Specimens Illustrating Some of the Geology shown in U. S. Geological Survey P. P. 146, Part 2, Micro-fossils of Texas; Scene Near East Base and Antarctic Nocturne, painting in oil by Leland Curtis, Antarctic Expedition, 1939-40, Department of Territories and Island Possessions; Indian Sculptures by Juan Nunez del Prado, Bolivia, by invitation of the Secretary; Exhibit Map of Costa Rica by Carmen Madrigal Nieto; Selected Materials from the Museum Collections.

Using the facilities of the museum, approximately 4000 students from high schools located in States east of the Mississippi River participated in two student institutes of Government conducted by the National Capital School Visitors Council. A Teacher's Institute of Government from the University of Maryland also conducted a study of the museum displays. Public and private schools were given conducted tours of the museum galleries throughout the year.

Letter of Transmittal

The Secretary of the Interior

HAROLD L. ICKES, Secretary

MY DEAR MR. PRESIDENT: This report covers 12 months during which the Department of the Interior has been tested rigorously for those virtues which, it is sometimes said, have vanished utterly from the regular departments of the Federal Government.

In our biggest job, that of mobilizing the Nation's natural resources for war, we have been tested for agility in improvising new tactics on the field as new challenges arose and old ones changed, for economic performance, and for resistance to that wartime itch for overcentralized authority. In our secondary job, the prosecution of a minimized but inescapable conservation program, we have been tested for the plain gumption that is needed to know what to stop doing for the Nation's good as well as what to do, and for our ability to prepare for peace in time of war.

You will notice that our job is, by brief and limiting description, the same as it was last year. That is because we assumed the job of marshaling the Nation's natural resources on the very day that Pearl Harbor was bombed. But despite identical labels, this year's work has differed from last year's. It is one thing to conceive and launch a great new program, and a quite different thing to push the program through when the obstacles loom in front. This has been the year of the big push, and execution has been a real test, as I have said.

From the very beginning, we have labored under a modern version of the ancient and vexatious command to make bricks without straw: we have had to do more, vastly more, with less and less to do it with. The huge new war-production plants of the West depended upon us for more hydroelectric power to make more implements of war—more ships, more tanks, more planes. The normal ways of increasing power, the installation of more generators, the construction of more dams and more transmission lines, were barred. The construction materials that we needed were needed elsewhere. There was a man-

power shortage to contend against, and other obstacles were numerous and formidable. We had to push for larger food crops, but to economize on scarce materials, many projects that might have extended irrigation were closed. We had to promote the production of more fish and fishery products despite a shortage of fishermen and fishing equipment. The world looked to the Federal ranges for more meat, but in order to concentrate on even more pressing war needs we had halted many activities that keep the ranges conditioned to fatten cattle.

Being denied the normal means of increasing the production of one resource after another, we turned to other means. We narrowed our demands for materials with which to build for increased power to that which was essential to the national safety, then pleaded the case for that minimum convincingly enough to get it. Or, we moved a generator from the plant for which it was intended to another plant at which it could produce power quicker or to better advantage. Where larger catches of fish that are customary food were not possible, we persuaded the industry to land edible species which were taken with the usual catch, but formerly discarded because they were not in demand. Then we persuaded consumers to accept these species as food.

The important thing is that, in the end, we did vastly increase production. We doubled our output of hydroelectric power. We increased our capacity to produce power by nearly half a million kilowatts. The salmon pack in western Alaska will exceed last year's pack by about a million cases. Despite our shattered range-improvement program, 85 million more pounds of meat were taken from the Federal range this year than last. We can report progress also in our search after the ores from which industry extracts the metals that armies and navies fight with. In response to the smelters' appeal for more zinc and copper for war, we revealed domestic reserves which contain 33 million pounds of copper, and 8 million tons of zinc and zinc-lead ores.

We not only did these things and many others: we did them economically. We cut this year's budget 10 million dollars below the amount which you approved, and voluntarily began operations on a budget that was 25 percent below the appropriation for the previous fiscal year. During this fiscal year we prepared next year's budget, scaling it down to 66 percent below the appropriation for 1943.

We achieved many of our economies by abandoning activities which could be dispensed with temporarily, and by minimizing others which could be curtailed, if not eliminated. I have heard that Federal departments never stop any activity until forced to do so, but we have

suspended many operations aside from those that ceased for lack of men and materials. The Grazing Service alone held in abeyance a score of range-improvement projects. I have already reported the gains which particular bureaus made despite their curtailments. Other bureaus and offices economized similarly, but contributed impressively to victory just the same.

To take up the question of our ability to prepare for the future, is to continue the discussion of these deferred projects. We have consolidated them into a vast post-war work program, and we have kept the working plans for these projects up to date, ready to unfold and follow when the firing ceases. We could launch much of our program within 30 days after victory. On one type of project alone—power and irrigation construction—we could keep 480,000 demobilized service men and war workers gainfully employed for 3 years—225,000 of them at construction sites and 255,000 in the plants and factories that would provide materials for the developments. When complete, this construction would open farm settlement opportunities to 165,000 families.

We have wrestled with the problem of keeping the huge new industrial plants of the Northwest busy when peace comes. They have grown up on the low-cost power which we provide, and flourish now on war production, but what shall they manufacture and to whom shall they sell it when the last war contract is finished? The Bonneville Power Administration, which distributes this power, searched diligently for the answer during the year with some encouraging results, and the search continues.

We have kept in mind the huge contribution which the United States will have to make to replenish the world's war-depleted larder. Consequently we gave an important place in our post-war program to irrigation projects. We are prepared to extend irrigation to 6,000,000 additional acres, and to supplement the water supply which now irrigates 9,000,000 acres, but which irrigates them inadequately. Six of our bureaus have worked together, and continue to work, on a food production program that embraces extended irrigation, range conditioning for the production of more meat, various means of increasing the production of fertilizer, the further tapping of fish and wildlife resources, and much besides.

We also continued to prepare for the day, only decades—not centuries—in the distance, when our liquid fuel reserves will be depleted to dangerously low levels. To cushion the shock of that inevitable occurrence, we furthered our experiments in extracting liquid fuels from coal and oil shales which are abundant.

Instead of centralizing authority, we tended generally toward decentralizing it. In particular, we decentralized one of our most powerful and far-reaching functions; that of directing local use of Reclamation projects in accordance with Federal conservation policies. We established six regional offices and appointed local directors to give order to the use of power and irrigation projects which are now in operation, and to recommend new projects in accordance with the varying needs and prevailing practices of their respective regions. They are not free, of course, to override fundamental conservation policies; but they are granted "extensive latitude for independent action," in behalf of their communities within the ample premise of sound conservation policies.

I have not expressly mentioned the assistance which some of the bureaus and offices of the Department have given me in my capacity as Petroleum Administrator for War, Solid Fuels Administrator for War, and Fisheries Coordinator. But that assistance has been considerable, and in some instances a Departmental bureau or office has been the mainstay of an extraordinary agency.

You will find a fuller account of the regular and special functions of the various bureaus in the remainder of this letter, but even that account will not be as detailed as usual because we have cut our report to half-length for economy's sake as we did last year. Still, I think that you will find enough detail to support my assertion that we have been through a severe test, and enough about the results to determine whether we have acquitted ourselves well or have failed.

THE BUREAU OF MINES

The United States, manufacturing for war at a record-breaking pace, called for an unprecedented production of minerals. In response the Bureau of Mines again took a leading part in finding new ore reserves and in devising methods for their rapid utilization in the multi-billion-dollar production program of American industry.

Blast and open-hearth furnaces required more ore, more flux, and more coke. The Bureau of Mines, with 32 years of progressive research in all fields of the mineral industries, found usable iron-ore deposits in 20 States to provide potential supplements to the iron reserves currently utilized; and intensified its experiments in the production of sponge iron as a possible substitute for steel scrap. It promoted the production of high-quality coke of a uniform grade; it carried on extensive exploratory work to help the output of fluorspar for flux; and assisted in the greater recovery of ore from operating underground iron mines.

Smelters called for more ore for zinc and copper to provide weapons and equipment for war materials and lend-lease. The Bureau's exploratory projects revealed additional domestic ore reserves containing 33,000,000 pounds of copper, and disclosed 8,000,000 tons of zinc and zinc-lead ores, substantial amounts of which are being brought into production.

The demands for mercury increased steadily and the Bureau sent its crews into seven mineral-bearing areas to increase the known reserves of cinnabar. At the end of the year they had made known more than 600,000 tons of ore.

The production of 6,000 or 7,000 war planes monthly resulted in a heavier drain on domestic bauxite for aluminum. In less than a year the Bureau's engineers had increased the known reserves of bauxite by more than 10,000,000 tons and, in addition, had charted some 100,000,000 tons of alumina-bearing clays for possible future use.

Such achievements by the Bureau were added to the long list of war-time accomplishments which date back 21½ years before Pearl Harbor when the Bureau, at the direction of the Congress, embarked on the long-needed inventory of the Nation's mineral wealth.

Because many of our domestic ores are lean in war metals or are difficult to beneficiate, the Bureau conducted studies to determine which low-grade ores could be processed advantageously, which could not be, and which method should be applied to those that could be processed. Thousands of samples were analyzed. By this rapid, authoritative system of reporting to industry the comparative amenability of various ores to processing, the Bureau helped to eliminate costly, chance-taking explorations of doubtful deposits.

Advancements were made in the methods of producing chromium, manganese, vanadium, cobalt, copper, nickel, molybdenum, tungsten, and other war metals from complex or low-grade ores. When significant findings occurred, the war agencies and appropriate industries were advised regarding the Bureau's progress. Simultaneously, the Bureau gained steadily in cooperative research projects, undertaken with industry, to solve specific problems.

Significant attainments resulted from exploratory, laboratory, and pilot plant work in nonmetallics. Millions of radio insulators, made from domestic talcs tested by the Bureau, were processed in a Bureau laboratory to aid the manufacture of essential communications equipment for the armed forces. Exploratory crews proved that there were deposits of more than 1,000,000 tons of flake graphite, and the War Production Board approved the building or reconstruction of mills to process this domestic graphite.

In analyzing more than 23,000 samples of coal for Federal agencies, particularly the Army and Navy, whose purchases of solid fuels total several millions of tons annually, the Bureau saved considerable sums of money for the Government. Coal-storage and coal-procurement problems were brought to the Bureau by industry and solutions were provided by experts who have had long experience in those fields. One such problem involved the storage of 50,000,000 tons of coal on Great Lakes docks. To help solve the fuel-oil shortage problem, the Bureau cooperated with an oil company in operating a boiler plant on colloidal fuel, a mixture of pulverized bituminous coal and bunker C fuel oil.

The Bureau embarked on laboratory-scale investigations of the indirect process for making synthetic gasoline, oil, and other petroleum products from coal and continued its research in the direct hydrogenation process. Although the experiments in coal hydrogenation were launched by the Bureau in 1935, they came into greater prominence during the year because of recurring gasoline shortages for civilians, and because of the growing concern over the depletion of domestic petroleum reserves.

Symbolic of the Bureau's ability to dovetail its activities most effectively with the whole war program was its production of helium for Navy antisubmarine blimps, for meteorological balloons, and for a dozen other essential uses. From its plant at Amarillo, Tex., and from a newer plant that was completed during the year the Bureau pushed production of the lightweight, inert gas to about 25 times that of 1941. To supply anticipated needs, the Bureau rushed the construction of three other helium plants in the Southwest, and drilled additional wells in the Texas helium field. Every demand for this noninflammable gas by the armed services was met.

Demands for special lubricants and 100-octane gasoline for war planes, the need for more chemicals for explosives, and the heavier use of gaseous fuels by industry threw greater emphasis on the Bureau's special research in petroleum and natural gas. Several new research programs were begun, and the Bureau's findings helped to increase the production of high-test gasoline, benzene, toluene, and other petroleum byproducts. A mobile field laboratory was dispatched to petroleum fields to speed the flow of technical information to operators. An extensive field-testing program was undertaken for a natural-gas reservoir in the South-Central area, and valuable assistance was given the Petroleum Administration for War by the Bureau through its studies of deep, high-pressure fields of the Gulf Coast.

The health, safety, and plant-security activities of the Bureau increased manyfold as Americans in war production worked closer to-

gether, for longer hours, and at higher speeds. As the need to conserve manpower, equipment, and other plant facilities of the mineral industries became more pressing; safety experts in the Bureau gave first-aid training to more than 45,000 workers; and coal-mine inspectors visited more than 1,100 mines in the United States and Alaska to investigate health and safety practices and to counsel workers and officials on safer methods of performing their jobs so that the wartime production of coal would not lag. Improvements in many mines resulted from this work and, despite a general increase in industrial accidents, numerous mines cut their accident toll while increasing their output.

In administering the wartime Federal Explosives Act, a barrier to sabotage, the Bureau investigated 9,000 stores of explosives, approved the granting of more than 350,000 licenses under the act, and investigated accidents in which nonmilitary explosives or their ingredients were involved. Plant-security studies of the Bureau—another wartime assignment—were conducted at nearly 2,000 mines and related facilities. Many inspections were made jointly with Army officials.

The special confidential laboratory experiments and studies undertaken by the Bureau for the Army, the Navy, the Maritime Commission, and others closely associated with the prosecution of the war, increased in number and scope. Typical experiments inquired into the characteristics of explosives, metallic and nonmetallic dusts, gases, vapors, and liquids, the safety qualities of protective equipment, and the prevention of accidents involving the handling of inflammable materials.

Assisting such war agencies as the War Production Board, the joint War Production Board, Office of Price Administration Quota Committee, the War Manpower Commission, and the Solid Fuels Administration for War, the Bureau completed many special studies which provided these offices with up-to-date interpretative facts regarding the production, consumption, uses, stocks, and other information involving mineral commodities. The Bureau provided specific information about war minerals to hundreds of inquirers each month.

THE GEOLOGICAL SURVEY

The Geological Survey also did much of its work in response to industry's insatiable demand for mineral commodities. War-production demanded not only more of the materials that are ordinarily recognized as of strategic importance; it also demanded more of many

minerals, the supply of which had hitherto been considered adequate, because deposits were abundant, or because demand had been slight.

The Geological Survey was especially qualified to evaluate the sources of needed minerals in the United States and in other American Republics. Its Geologic Branch was on a war footing, acting as a fact-finding organization and as an adviser on policies of mineral production and problems of reserves. During the year more than 700 mines and mineral areas were examined, and reports of the findings were made to various Federal agencies, in response to their direct requests in many instances.

In addition to studying mineral deposits, the Survey assigned about 30 geologists to help meet the increasing demands of the War and Navy departments for geologic information about strategic foreign areas. This information was for use in military engineering abroad.

One of the outstanding activities of the Geological Survey was (and still is) the compilation by its Alaskan Branch of aeronautical charts which were needed by the Army air forces. In the course of that work trimetrogon planimetric mapping covering 2,146,000 square miles of strategic areas, widely distributed throughout the world, was completed. The high quality of the product and the speed and the low cost at which it was made available established records. This remarkable performance was made possible through the utilization of the Survey's engineers who are skilled in rapid reconnaissance field surveys and who have trained a special force of assistance to use the unique methods and special apparatus that have been designed largely by the staff of the Alaskan Branch. In this work they have had the close cooperation of members of the Survey's map reproduction plant in the use of all its facilities.

The Topographic Branch emphasized the making of maps within the strategic areas outlined by the War Department. Of 241 quadrangles for which maps were published during the year, 160 were within the strategic areas; of 228 quadrangles for which mapping was completed, 166 were in such areas, and of 456 quadrangles for which work was in various stages of progress at the close of the year, 416 were in strategic areas. These figures indicate the importance of the Geological Survey's part in the military program. The aerophotogrammetric unit at Clarendon, Va., with increased production facilities and working two shifts, continued to accomplish a large amount of photogrammetric mapping. This unit also maintained a central laboratory for designing, testing, repairing, and adjusting all types of special optical and mechanical equipment which was needed for stereophotogrammetric work. Up to the present time, 47.1 percent

of the total area of the United States has been covered by adequate topographic maps which the Survey has produced.

The strategic importance of water in all human activities is accentuated when those activities are directed to the waging of war. Military establishments and war production plants are scattered from coast to coast, and many problems of water supply confronted them. The geologists, engineers, and chemists of the Geological Survey helped to solve them, and contributed effectively in a surprising number of other ways to the success of the war.

The information on water accumulated in the routine reports of the Water Resources Branch affords a dependable basis for the wise planning of water projects related to the war. This information was adapted to local problems and was supplemented by many special investigations. During the year more than 4,000 special reports on water were made to military agencies; to industrialists and engineers engaged on war contracts; to municipalities that sought to enlarge their water-supply systems in order to serve new concentrations of population; to producers of power who were obliged to build or enlarge power plants to increase the supply of electric energy for use in manufacturing establishments; and to irrigation engineers who were assisted by this data in expanding irrigation systems for the production of more food.

The water experts of the Survey have served also with the armed forces, either as officers or civilians, in obtaining water for the armies in the field, where a wide variety of new situations extending even up to the fighting lines must be met quickly and surely.

Increased demand for minerals, fertilizers, chemicals, water power, and petroleum accelerated prospecting on the public domain and on certain Indian lands which are under the supervision of the Geological Survey. The conservation and development work fostered by the Survey includes surveys and investigations of water and mineral sources and supervision of certain phases of mineral and power production on these lands. The production of coal, sodium, potassium salts, phosphate rock, and crude oil from public lands during 1943 was substantially greater than in 1942. On Indian lands an increased production of coal, vanadium and petroleum, and the working of substantially lower-grade lead and zinc ores were reported.

Continuing efforts, though hampered by manpower shortages, are affording enhanced consultative activities, accelerated field investigations and studies, particularly in regard to secondary recovery methods and an increased contribution of minerals from federally supervised land in support of the war program.

THE BUREAU OF RECLAMATION

Wherever American troops have fought this year they were better equipped and better fed as a result of the contribution of the Bureau of Reclamation. Guns, tanks, and planes were produced in large quantities in plants that operated on power which was generated on Reclamation projects. Much of this matériel was carried to fronts on which it was sorely needed in ships that were built with power from the same source. Troops and civilians at home and abroad were provided with food that was grown on land which Reclamation projects irrigated. Industrial and military concentrations tapped Federal reservoirs for homes and plants and barracks.

The Bureau's continued expansion of power production for war was impressive. The output of 30 plants on 19 projects—9½ billion kilowatt-hours—was double the 1942 total. The production was equivalent to that of all plants in the 11 far Western States 20 years ago. Nearly half a million additional kilowatts were developed during the year. The capacity is now 1,850,000 kilowatts—twice the Bureau's pre-Pearl Harbor installation.

Most of 900,000 kilowatts that were made available in a 2-year period were installed 2 to 10 years ahead of schedule, at Boulder, Grand Coulee, and Parker Dams. These giant structures were erected in time of peace as part of the Department's far-sighted policy in planning for construction to keep ahead of the inevitable industrial expansion of the West. In terms of war equipment, the new generators potentially are capable of providing annually the power required to build 30 large battleships, or to construct more than 11,000 "Flying Fortresses".

The production of essential foods on the 4,000,000 acres of land that were irrigated by Reclamation facilities in 15 Western States, also contributed toward victory. From these highly-productive areas, once desert wastes, came enough beans to provide an annual supply for nearly 22 million persons, enough potatoes for 13 millions, (through alfalfa fed to beef and dairy herds) enough beef for 4½ millions, and milk for 3¾ millions.

Even greater harvests of food crops may be expected this fall as the result of the response of irrigation farmers to the plea of the War Food Administration to shift from the less essential to the more important war crops. Spring plantings of potatoes this year were 44½ percent greater than last year, and the bean acreage is 36 percent higher. The 1943 cultivated acreage on Reclamation projects is expected to be the largest ever reported.

The huge irrigated yields are materially reducing cross-country shipments of certain foods, chiefly processed meat and dairy products, on which the West has always been dependent. This releases transportation facilities for other war activities and saves large quantities of fuel and equipment required to operate trains and trucks.

The gross value of crops produced on the land that was served by Reclamation works during the calendar year 1942 was \$272,048,516, an increase of more than 45 percent over the 1941 value and a 100-percent gain over 1940.

Conditions beyond the control of the Bureau prevented it from carrying out in full the power program outlined in 1941. This called for increasing the installed capacity to more than 3,300,000 kilowatts by 1945-46. Studies showed that the industrial demand of the West would absorb the output of the additional generators. The War Production Board, however, took the position that critical materials were more urgently needed in other war activities, and stop-construction orders were issued against the 865,600 kilowatts. The Bureau was permitted to proceed with installations which will increase the capacity of its projects to 2,436,000 kilowatts by October 1944—placing more generating equipment under its control than that of any other agency—Federal or private.

In order to grow more food for war, I directed the Bureau, in 1942, to prepare an irrigation construction program which would enable the West to increase agricultural production. But the requirement for the critical materials for other purposes was regarded as more acute, and nearly all irrigation construction was halted later in the calendar year 1942.

In the war food program which was submitted to the Department of Agriculture in March 1943, the Bureau indicated that by 1947 it could extend irrigation services to more than 9,000,000 additional acres, provided that critical materials, manpower, and funds were provided promptly. The program was modified later to embrace projects which would produce a more immediate effect through services to 2,000,000 additional acres by 1943. By June 30, clearances had been given by the War Production Board on projects aggregating less than 300,000 acres. Committees of the Congress joined in recommending irrigation construction as a means of advancing war food production, and additional substantial appropriations of funds were made.

In addition to power and irrigation services, supplemental municipal and industrial water was provided for cities, military concentrations and industries in areas served by Reclamation projects. In all, nearly 5,000,000 persons live in western regions which look to the Bureau for these services.

At the end of the fiscal year, 71 projects were in operation, under construction, or authorized. Fifty-two of these were for generating power or supplying water for irrigation and other beneficial uses. On or near practically every Reclamation project are air bases, other military establishments, and war industries, including aluminum and magnesium plants, airplane factories, shipyards, chemical and other manufactories.

The storage capacity of 81 reservoirs reached a new high, or more than 64 million acre-feet of water during the year. The active storage content on June 30 was 43½ million acre-feet.

While war contributions were of paramount importance during the year, attention also was focused on the problems due to arise in the post-war era. In anticipation that the Nation will be called upon to provide employment and settlement opportunities for the returning service men and war workers, the Bureau continued to assemble an impressive list of projects for construction during the post-war period.

Included in this program will be projects on which work has been halted or retarded during the war and about 50 others for which blueprints will be ready when the victory is won. It is estimated that 3 billion man-hours of work could be provided if this public works program can be carried out in full. It would extend irrigation to 15,000,000 acres of land, and would provide 3,300,000 new kilowatts of power for war industries converted to the production of peacetime necessities.

I have already referred to the decentralization plan for this Bureau as an indication of our willingness to disperse authority. I also expect that this reorganization, which provides for four major branches with offices at Denver in addition to the six regional offices, to increase our efficiency. The greater number of interrelated and complex problems arising from the construction and operation of the many Reclamation projects for irrigation, power, and related purposes, makes a closer coordination of Bureau activities essential, particularly during the war. For the long-term program, I believe that the decentralization will bring the people of the West into closer contact with the many functions which affect so vitally the future of a third of the Nation's land area.

THE SOLID FUELS ADMINISTRATION FOR WAR

The difficult task of assuring an adequate supply of coal for war industries and for essential civilian uses was carried out successfully during the past fiscal year and steps were taken to provide, so far as possible, assurances of a continued supply in the future.

Pursuant to your Executive order of April 19, 1943, directing me, as Secretary of the Interior, to serve as Solid Fuels Administrator for War, I established this office, which absorbed the personnel, records, and programs of the Office of Solid Fuels Coordinator for War which I had established under your instructions in 1941.

The present office, under its broad authority, has been carrying out your Executive order of May 1, 1943, directing the Secretary of the Interior to take possession and control in behalf of the Government, of coal mines in which work stoppages had halted or were threatening production. The Administration continued to serve as the Government's agent in operating the mines during the next 2 months, through periods of new work stoppages, until I transferred the operation of the mines to the Coal Mines Administration.

The Solid Fuels Administration and its predecessor, the Office of Solid Fuels Coordinator, has worked in close cooperation with the coal industry. Through its Solid Fuels Advisory War Council it has initiated and coordinated policies to the end that the Nation's coal supply might be adequate.

Coal production in 1942 totaled an estimated 580,000,000 tons of bituminous and about 60,000,000 tons of anthracite, thus exceeding estimate of the year's requirements. The surplus bituminous coal went into stock piles, as a result of a coal stocking campaign which was carried on by the Office in the summer months of 1942. These stock piles reached record heights during November and, although they had dropped as the result of rising consumption, prevented many production losses by industry during the coal mine strikes in May and June.

To meet the estimated requirements of 665,000,000 tons for 1943, I prevailed upon mine operators and labor to agree to lift their former 35-hour workweek limitation. The 42-hour workweek which was adopted made possible the maintenance of production despite continued losses of mine manpower to the armed services and to other industries.

The necessity for coal to meet the requirements of consumers who had converted from fuel oil to coal, to provide transportation for coal to areas where requirements had been greatly changed by the war, to supply anthracite for Eastern States, to make sure that vital mines were not handicapped by lack of equipment and repair parts created complex problems.

Many of the problems continue. Manpower shortages will make it difficult to compensate for production stoppages which occurred during the strikes. Conservation in the use of coal may help to restore the balance. If shortages should develop, the Administration will

put into effect programs to assure an equitable distribution of the available coal.

THE BITUMINOUS COAL DIVISION

Although there had been furnished impressive evidence that the Bituminous Coal Act was an essential part of the Nation's war machinery and that its mechanisms were efficient and workable for the peacetime stabilization of the chronically distressed bituminous coal industry, the Congress permitted it to expire automatically August 23, 1943.

The opposition to the act which developed at a hearing before the Ways and Means Committee from June 21 to July 5, 1943, on several bills for its extension was based on contentions that the act established a system of regulation which is inimical to free competition and constituted an undesirable precedent for the establishment of post-war business regimentation. It was urged that it had been rendered unnecessary by the establishment of the Office of Solid Fuels Administration for War and by improved conditions in the industry, and that the strikes in the coal mines because of the inability of management and labor in the bituminous coal industry to reach a wage agreement demonstrated that the act had not stabilized the industry.

While the opponents of an extension of the act admitted that the industry had achieved stability with respect to costs and realization during the period that the act was in operation, they insisted that this rehabilitation was attributable solely to wartime expansion in demand for coal. While contending that the act had nothing to do with the rehabilitation of the industry, opponents also argued that it had resulted in exorbitantly higher prices to the consumer of bituminous coal.

Abundant testimony was placed before the committee to show that the Coal Act did not provide an alien or novel system of regulation, but only precluded unfair methods of competition, and did not fix the price at which coal had to be sold, but only fixed the price below which coal could not legally be sold. It was demonstrated that the bituminous coal industry is composed of between 12,000 and 17,000 scattered business units and, like agriculture, has been consistently depressed because of the typical inability of the diffused industry to regulate a situation in which a relatively few strong buyers can play against each other numerous necessitous sellers. No testimony was offered before the committee to substantiate a belief that the Bituminous Coal Act would form a pattern for post-war business regula-

tions any more than the Act to Regulate Commerce in 1887 has furnished an all-time business regulatory pattern.

The record showed that the functions of the Secretary of the Interior as Solid Fuels Administrator for War were different from those of the Department under the Bituminous Coal Act, and that the existence of a sellers' market did not dispense with the necessity of maintaining the stabilization factors provided by the act.

It was indicated clearly that the inability of labor and management in the coal industry to negotiate a wage agreement consonant with the law could not be attributed in any way to the Coal Act because nothing in the act compelled either labor or management to reach an agreement. However, the removal of the assurance to the industry of the recovery of the cost of production furnished by the minimum price structure under the act might well make the execution of a wage agreement by the operators and mine workers more difficult.

For approximately 15 years prior to the enactment of the Bituminous Coal Act, the industry's yearly losses ran to millions of dollars. The Bituminous Coal Division offered the committee a precise statistical measurement to show that this loss continued through 1940 until October 1, the date on which minimum prices under the act became effective. There was no indication that the situation was improving. However, during the final 3 months of 1940, with minimum prices effective, the industry as a whole operated at a slight profit, and has continued to operate with a profit since. This rehabilitation cannot be attributed to exorbitant prices which have been prejudicial to the consumers, since the minimum prices in existence during the hearing on the extension of the act were only 29 cents a ton higher than the average depressed going prices of 1939.

It has been shown that the bituminous coal industry, because of the economic conditions that I have mentioned, has suffered distress for many years during periods which were unrelated to general periods of prosperity or depression. Between 1923 and 1929, generally prosperous years in other industries, 3,274 mines with an annual production of 1,000 tons or more each went out of business. While the impetus of the industrial activity due to the war may temporarily relieve these conditions, there is no foundation for believing that it will remedy them permanently. Unquestionably, instability in the coal industry remains, with the expiration of the act, an unsolved economic problem.

The stabilization of the industry through the operation of the minimum price structure accounts for its ability to meet unprecedented wartime coal requirements. The Bituminous Coal Division, the administrative agency of the act, accomplished many specific war-

time tasks for many agencies. This work either will have to be abandoned or accomplished by agencies established at additional expense.

THE BONNEVILLE POWER ADMINISTRATION

The Bonneville Power Administration was able to more than double its power deliveries to war industry during the year, despite shortages of material and construction curtailments.

Only through the availability of power produced at Bonneville and Grand Coulee Dams was it possible for plants in the Northwest to produce ferroalloys for the armoring of thousands of tanks, and aluminum for airplanes. These two great dams were also the source of motive power and electric heat for the high speed production of merchant and naval vessels, and for the manufacture of many other essentials of war.

These things were made possible only because your administration steadfastly pursued its policy of developing the Northwest power resources well in advance of need.

This policy enabled the Bonneville Power Administration to meet continuous new calls for industrial production with a power supply and transmission facilities from the great dams on the Columbia River.

Bonneville and Grand Coulee Dams were first put under construction 10 years ago. At that time, and during the years following 1933, many persons expressed skepticism as to the need for the Columbia River development. But if this development had been required to wait until Pearl Harbor, the Nation's war production program would have been held back for years and there would now be few war industries of consequence in the Pacific Northwest.

In addition to tremendous power deliveries directly into war industry over the Federal transmission system, the Administration supplied nearly 1,000,000,000 kilowatt-hours to the systems of 10 other major Northwest utilities, thus enabling them to meet their war commitments. The formation of this wartime power pool, one of the largest in the country, was in conformance with the instructions of your administration, as set forth in the War Production Board's Order L-94. One utility system, interconnected with Bonneville, depended upon the Administration for virtually one-third of its entire power requirements. When it is considered that this utility system serves one of the most congested and productive war industrial centers on the Pacific Coast, the significance of the Bonneville Power Administration's contribution to the Northwest power pool becomes at once apparent.

In wartime, weapons, not dollars, are of first importance. Yet it is worthy of note that, during the fiscal year 1943, the Bonneville Power Administration collected more than \$11,000,000 in revenue, from the sale of power. This money, more than double the revenue of the preceding fiscal year, brought the total collections by the Administration for the first 5 years of its existence to more than \$18,000,000.

THE DIVISION OF POWER

The work of the Division of Power has related primarily to the supervision of the power operating activities of the Department in a manner intended to assure that the greatest possible amount of power was made available in the war program, efficiently and economically. The work of the Division has increased greatly, due to the large increase in the power output of the plants of the Department and to our shift of emphasis from construction to operating and marketing. The Division consulted and worked with other agencies of the Government, such as the War Production Board, the Federal Power Commission, and the Defense Plan Corporation, in connection with a number of national and local power problems.

An order of the Secretary was issued outlining somewhat more in detail the basic duties of the Division and formalizing certain of the procedural relationships between the Division and the power operating agencies.

The Division staff reviewed a large number of power contracts, most of the effort being required on important and complicated arrangements to provide power for war. Members of the staff also participated with the operating agencies in the negotiation of a number of the more difficult war contracts for the sale of power from the plants of the Department. In cooperation with the operating agencies and other bureaus of the Department, a number of studies of special matters relating to rates, markets, cost allocations, legal problems and other questions were made or initiated.

THE DIVISION OF TERRITORIES AND ISLAND POSSESSIONS

Wartime dislocations overhung the lives of the 21½ million inhabitants of the Territories and island possessions of the United States to a greater extent than in any area of comparable size in all of the mainland. These Territorial areas—Alaska, Hawaii, Puerto Rico, and the Virgin Islands—are geographically isolated from the mainland from which they import most of their supplies. Each is a busy, strategic

base for a part of our global war activities, and, as such, has encountered intensified health, housing, education, and food supply problems.

To solve these complex problems more effectively, the Division was reorganized during the past year and has worked closely with other agencies of the Government.

The strenuous efforts of the Insular and Federal Governments averted the food supply disaster which appeared inevitable in Puerto Rico in the summer of 1942. For a considerable period basic foods, such as rice and codfish, had been virtually unobtainable. Wholesalers and retailers were threatened with bankruptcy as the result of the depletion of stocks. By September of that year food supplies in the island reached bedrock. In October the Civilian Food and Supply Unit was established in this Division. An agreement was reached between the Department of the Interior and the Department of Agriculture under which the Food Distribution Administration, acting for this Department, began procuring foodstuffs on the mainland for distribution by sale to wholesalers in Puerto Rico in accordance with estimates of requirement set up by this Department. The War Shipping Administration allocates varying amounts of tonnage to the Puerto Rican route monthly, and the Interior Department assigns space on these vessels for the food and general supplies needed in the Island.

Since the time the Government took over, food shipments have increased regularly and a stock pile has been built up which would supply the basic needs of the island should there ever be a recurrence of heavy submarine warfare in that area or should there again be a shortage of shipping for any other reason. For the 9-months' period from October 1, 1942, when the Government took over, through June 1943, the average monthly shipments of foodstuffs, grains, feeds and fertilizers compared favorably with those for the three normal years, 1939 through 1941, when, according to Department of Commerce figures, 24,777 tons of foodstuffs were shipped monthly. Although there have been shortages from time to time, just as in this country, the basic products have been supplied since the Government assumed responsibility, and the people of the island have been provided with essentials. Satisfactory shipments have also been made of the general supplies which industry has needed. The Department of the Interior also allocates the shipping space for these supplies.

At the end of the fiscal year arrangements had been made, in accordance with original plans, to turn back the procurement of certain non-essential food items to the regular pre-war channels.

All procurement and shipping arrangements for Puerto Rico and the Virgin Islands have been considered jointly, because the areas are close together and because their supply situations are similar.

Inasmuch as it was realized that any increase in production of island-grown foodstuffs would help relieve the shipping situation and contribute toward insular self-sufficiency, the Department of the Interior, the Department of Agriculture, and the Insular Government assumed responsibility for local planting programs. The Food Distribution Administration distributed the seed to farmers in Puerto Rico and the Virgin Islands at half price and guaranteed a price for home-grown foodstuffs. Under this program the production of rice in Puerto Rico for 1942-43 increased 69.8 percent over 1939-40; legumes increased 26.4 percent; corn 56 percent; and starchy vegetables 22.2 percent.

In the development of the campaign to drive the Japanese from North America, the Aleutian Islands, previously almost uninhabited, have become centers of activity. As the tide of military action has swept westward, the military bases on the Alaska mainland, originally constructed for defensive purposes, have been used increasingly as depots for the transshipment of men and matériel to the islands. Alaska has seen such activity as never before encountered in her entire history. Here, too, large shipments of civilian food and other supplies were made in the fall of 1942. These have been properly warehoused at a number of strategic points in the Territory and replenished from time to time with fresh supplies.

Labor turn-over in Alaska has been heavy with the various Army, Navy, and civilian activities competing for the available supply. Despite the labor shortage and the fact that the winter was one of the most severe in the history of the Territory, the Alaska Railroad maintained its schedules almost without interruption and kept the flow of supplies and military equipment moving steadily.

In August this Department and the Department of Justice opened negotiations with the War Department for the restoration of civil jurisdiction in the Territory of Hawaii. An agreement was reached and on February 8, 1943, various specific functions were officially returned to civilian control.

Civilian defense in Hawaii continues to maintain a high degree of efficiency.

THE GENERAL LAND OFFICE

Due to the foresight of your national conservation policies, the General Land Office was able to furnish from the public lands under its jurisdiction a noteworthy share of the natural resources which

were needed to fight the war and to meet the needs of the United Nations.

More than 5,000,000 acres of the public domain were made available for troop training, aerial bombing and gunnery practice, and other military purposes during 1943, bringing the grand total of public land areas devoted to such war use to approximately 15,775,000 acres—an acreage equal to that of several States. In addition, more than 70,800,000 acres were withdrawn so as to assure the development and production of strategic war minerals, while smaller tracts were furnished for defense plant sites and to provide housing sites for war workers.

An increase by about one-third in the amount of gasoline and butane produced from the public domain was recorded during the year, and other mineral products were secured for military use under the system of public domain leases which were maintained by the General Land Office.

Despite the heavy volume of its war work, this branch of the Department maintained its position as one of the few executive agencies in the Government which operates at a profit to the Federal Treasury. Returning \$4.25 for every \$1 spent, its cash receipts were \$9,758,066.48 as compared to \$2,304,416.39 in expenditures. Incidentally, 1943 was the second consecutive year in which total cash receipts exceeded \$9,000,000.

A great advancement was made in the program of your Administration for sustained-yield forest management on 2,500,000 acres of Oregon and California revested railroad grant lands, which will assure a permanent economic stability for communities and industries in that lumber-producing region in western Oregon. At the same time, efficient operations within the limitations of prudent conservation practices made possible the furnishing of approximately 417,000,000 board-feet of lumber for war use—lumber which ranged from heavy structural timber to airplane woods. These timber sales from the area produced nearly \$1,000,000 for the 18 Oregon counties in which the lands are situated.

Contributing its share to the supply of food, fiber and leather for fighting men and civilians, the public domain during 1943 afforded an opportunity for the grazing of livestock on 11,978,000 acres of land outside of Federal grazing districts in the continental United States and in Alaska.

During the year, 14 separate agencies of the Federal Government, including the Army and Navy, called upon the General Land Office for accurate field surveys of land areas under their jurisdiction. The development of production of potash and sodium in California, mag-

nesium in Nevada, coal in Utah and Wyoming, and timber in Oregon, was facilitated by these cadastral engineering activities.

The investigation of more than 4,000 mining claims to clear sites, selected by the Army and Navy for military purposes, was made by the Branch of Field Examination during 1943, the first full year of its operation as an agency of the General Land Office following its reorganization from its prior status as a departmental division.

In addition to its administrative responsibilities under the more than 5,000 public land laws, the General Land Office met many requests from Federal agencies and from the Congress for expert cooperation in the consideration of problems concerning the national land pattern.

THE OFFICE OF LAND UTILIZATION

The Office of Land Utilization, established pursuant to departmental Order No. 1466, dated April 15, 1940, to coordinate the land-management functions of the Department, continued its operations under the policy which prevailed during 1942, namely, a concentration upon activities which were either directly or indirectly related to the prosecution of the war. Immediate results have been increases in timber production, improvement in western range lands and the maintenance of a high degree of protection against subversive action, forest and range fire hazards, and sabotage seeking to disrupt or destroy strategic production facilities on lands under the jurisdiction of the Department.

Under date of March 12, 1943, the Office of Land Utilization was charged with the additional responsibility of representing the Department in all matters pertaining to the operation of work camps for conscientious objectors which operated on lands under its jurisdiction. At the end of the fiscal year there were 10 camps assigned to the National Park Service, the Fish and Wildlife Service, the General Land Office, and the Bureau of Reclamation. The work of these camps was revised during the year with a view to placing more emphasis on forest and range protection, thus materially strengthening the protection organizations of the Department.

THE GRAZING SERVICE

The conservation principles which are fostered under the Taylor Grazing Act of 1934 paid a dividend in 1943 amounting to 85 million more pounds of meat than was produced on the Federal range during the previous year. In reaching this new high figure, totaling nearly 900 million pounds of beef and mutton, the "free range" of earlier

days became an important cog in the Nation's war machine. In addition, several million acres of public land were used by the armed forces for training in aviation, bombing, chemical warfare, and as proving grounds.

In giving priority to war activities, the Grazing Service constructed 782 miles of access roads leading to 30 different types of strategic war minerals. As a result, thousands of additional tons of war materials were delivered to production lines on time. One road in Colorado made possible a tenfold increase in the delivery of vanadium ore to reduction plants.

One thousand, six hundred and fifty-five war emergency licenses were granted for 271,245 livestock, enabling producers to put more meat on the market. A total of 10,777,793 livestock, owned by 22,019 stockmen in 10 States, used the range under regular licenses and permits. The labor and other war conditions influenced a trend toward more cattle and less sheep. This change influenced the increased tonnage of livestock products that reached trade channels during the year.

THE NATIONAL PARK SERVICE

The National Park Service, reduced to a wartime staff, devoted itself to its primary function of protecting and maintaining the national parks and monuments, and at the same time made definite contributions to the war program.

Threats to invade the National Park System for logging, mining, and grazing purposes grew imminent during the year. Several concessions were made to further the prosecution of the war, but the basic policy that all reasonable alternatives must be exhausted, and that the demand must be based upon critical necessity rather than upon convenience, was applied in all cases in order to prevent any unnecessary sacrifice of distinctive park values.

On this basis, 403 permits were issued to military and war production agencies for the use of areas and facilities in the National Park System. It is estimated that it would have cost more than \$30,000,000 to have purchased these lands, structures, and services had the National Park Service not been able to make them available. It is impossible, moreover, to evaluate the benefits derived by more than 1,655,720 members of the armed forces who visited the parks during the fiscal year. There is ample justification for keeping the national parks and monuments open to those members of the armed forces who are being given opportunities to visit the inspiring American scenes which symbolize the greatness of the nation which they are fighting to preserve.

Although it was necessary to discourage civilian use of transportation resources involved in long-distance travel, approximately 6,572,500 civilians were able to visit the national parks.

The National Park System involves less than three-fourths of one percent of the total land area of the United States. Yet it is preserving for this and future generations some of the finest aspects of America. Under conditions of total war, this concept of conservation has faced the most critical challenge of its history. We have had to reaffirm basic park principles, and to ward off those who, under the cloak of patriotism, would reopen old issues as to the exploitation of the lands which Congress and the American people have decreed should be held inviolate for the national good. Some sacrifices in the common cause have been necessary, and more may be inevitable. But I believe that we can emerge from the war without departing from the basic idea that the national parks and monuments must be protected as symbols of our national greatness.

THE FISH AND WILDLIFE SERVICE

For an organization whose activities ordinarily are geared to the ways of peace, the Fish and Wildlife Service is very much in the war. The largest of all the National wildlife refuges under its administration, the Aleutian Island chain, was the scene of hostilities. The Pribilof Islands, to the northward, summer home of the famous and valuable fur seal herd, which for years has been so successfully managed by the Service, were evacuated at the request of the military authorities, and the native populations and administrative personnel are maintaining themselves in leased quarters on the mainland. Requested photographs, and information on the meteorology and typography of Alaskan and Siberian areas were furnished to war agencies. Military operations and other factors incident to the war in the region prevented full scale fishing. Consequently there was a considerable decrease in the halibut, herring, and salmon catches, despite every effort to achieve the maximum utilization that would be consistent with the conservation of the fisheries resource.

More than one and three-quarter million acres on 35 Federal wildlife refuges in the United States have been assigned to the military forces for training areas. Eleven of the larger vessels in the Service's fleet were transferred for war purposes.

Service personnel assisted the War and Navy Departments in patrol operations for the security of Alaska, in the detection of subversive activities, in the appraisal and acquisition of lands, and in the search for warmth-conserving and windproof furs and fabrics. We helped

to salvage the hides of deer and elk that were killed by hunters, and to control rats which destroy clothing and food supplies. We have worked to suppress plague-carrying field rodents, a menace to the health of troops, and to eliminate burrowing species that create hazards on air fields.

Food and fur production was intensified on wildlife refuges and on Indian lands. Fish propagation was directed toward the multiplication of the more valuable food species and toward increased cooperation in the farm fish-pond program. Campaigns to establish fisheries and to increase the catch were carried on in the Caribbean area and in the South Pacific. The utilization of previously little exploited fishes and other aquatic food animals was developed. Additional sources of vitamin oils and of seaweed gums that could be substituted for agar were investigated. We helped to increase the production of domestic rabbit meat for human food by amassing information on rabbit raising that reached every State.

To conserve tin, the use of nonmetallic containers for fisheries products and increased employment of dehydration and salting were recommended. To overcome a fiber shortage, substitutes for manila were brought to the attention of the fisheries industry.

Predator and rodent control was vigorously prosecuted to safeguard essential food and fiber resources by protecting sheep, goats, calves, and poultry from the onslaughts of predatory animals and by protecting growing crops, stored agricultural products and processed foodstuffs from destruction by field rodents and rats.

Law enforcement activities for the protection of both terrestrial and aquatic wildlife were continued with good results. Research, though carried on at a reduced rate, was never more important to the proper functioning of the administrative and regulatory operations of the Service.

THE OFFICE OF THE COORDINATOR OF FISHERIES

The Office of the Coordinator of Fisheries was established by Executive order on July 21, 1942, to meet a critical situation which had been created by the impact of war upon the fishing industry. Although fishery products—high-protein foods, industrial and therapeutic oils, and animal feeding meals—were needed more urgently than ever before, the industry had been so hampered by the requisitioning of vessels, the loss of men, shortages of gear, and by security regulations in coastal waters so that the catch of fish and shellfish in 1942 declined about a billion pounds as compared with 1941.

To the Coordinator of Fisheries was assigned the task of giving the industry direct and immediate assistance in its problems of manpower, equipment, and operation. Our goal was to increase the yield of urgently needed fishery products and to eliminate waste and inefficiency in the utilization of these essentials.

After a year of effort, marked by notable cooperation from the industry, we are able to record definite progress. For example, the pack of salmon in western Alaska this season is running ahead of last year's by about a million cases. A considerable number of boats, no longer urgently needed by the military services, have been returned for use in fishing, and still more are coming back. Comprehensive programs of operation, designed to make the best possible use of available materials and manpower, have been adopted for two of the major fisheries—salmon and pilchard. New products have been developed for civilian consumption or Government purchase by means of utilizing species formerly neglected.

The condition of the fishing industry is definitely improved as compared with last year. We are confident that the coming months will bring a further advance.

THE OFFICE OF INDIAN AFFAIRS

Eighteen thousand Indians are in the armed forces. They serve with distinction on every front where our Army and Navy are engaged. These Indian warriors come from families comprising fewer than a half million men, women, and children of aboriginal descent in all of the United States and Alaska.

Considering their small numbers, I think that equally significant are the Indians' contributions at home. The Indians are mainly direct war producers, either as the owners of large herds of cattle, as owners of land which grows food crops, as owners of forests and vital mineral deposits, or as a ready source of labor in our less populous West. Few Indians work solely for civilians.

In 1942, the Indians produced and sold food enough to sustain for 1 year 200,000 of the best-fed soldiers in the world, or an army of 6 million men for 1 week. Notable was their production of beef cattle and sheep, totaling almost \$13,000,000 in 1942 as compared with top livestock sales of \$4,000,000 during the last war. I am unable to measure the Indians' production as wage workers off of the reservations, but I am glad to report that employers who have employed Indians for the first time during this war have combed the reservations seeking additional Indian labor.

It would not have been possible to maintain production on Indian lands in the fall of 1942 and in the spring of 1943, if Indian women and children had not willingly replaced men. Indian women are cooking in lumber camps and assisting in cattle round-ups. They dip sheep on the Navajo Reservation, drive trucks, repair heavy machinery, and at the Menominee Indian Mills, Wisconsin, women are working in the sawmills and in the forests for the first time in Menominee history.

We are indebted to an 89-year-old Navaja woman, Mrs. Rose Daniels, for a new variety of lima bean which is on the market for the first time this year. In her odd little seed house on a Utah Reservation, Mrs. Daniels had carefully saved from her garden years ago three lima beans. Horticulturists have developed from her beans a new seed especially suited to a short growing season of a high dry country such as eastern Utah, Wyoming, and South Dakota.

Although ministering to the needs of only a small segment of our population, the Indian Service occupies a unique position among Federal agencies in that it is concerned with all the problems of a community. Its progress in helping a native people to rehabilitate themselves is becoming known abroad. King Ibn Saud, who is anxious to improve the economic lot of his people, invited the Chief Engineer of the Indian Service and a representative of the Department of Agriculture who had worked on soil problems on the Navajo Reservation to comprise a U. S. Agricultural Mission to Saudi Arabia. This mission was completed this year and its recommendations were published by the State Department in English and in Arabic for the use of the King and his advisers.

South American countries have large Indian populations, and 11 distinguished Latin-American educators and soil technicians representing 8 countries spent from 3 weeks to 4 months studying administration on U. S. Indian Reservations this year.

CONCLUSION

That is our record in brief. It reveals that our performance has been imperfect as all things human are. But I am proud enough of it to let it stand without a word of special pleading. I prefer to discuss instead a topic that is not dwelt upon enough: the source from which we derive such strength and wisdom as this report may show us to possess. We derive it from the nation—from the whole people.

The Senators and Representatives who speak for the people whose resources we marshal speak directly to me. The record of congressional inquiries into our performance and our intentions fill a book or several books each year.

XXX

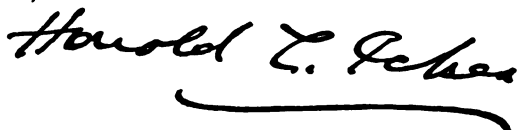

Of the forty-odd thousand employees of the Department, fewer than 5,000 are here in Washington. The others are in the field and are in touch constantly with the people whose resources we manage.

Our bureaus and offices habitually formulate policy in consultation with spokesmen for the people who are affected by our policies, and many policies are also carried out in cooperation with representatives of the people.

We are not remote from the working and fighting fronts of this world. Our key men are on the scene of action in all the fields into which our jurisdiction extends. Our geologists work beside officers of the armed forces day after day to guide the high command at the front in taking military advantage of the geological peculiarities beneath the ground on which battles are about to be fought. Our water specialists work with other officers to reveal the secrets of water resources in countries that are marked for occupation. Some of our scientists go directly to the front in the course of this work.

In a word, so many of us are in such close and constant touch with other persons who work and fight for this Nation; we draw so much of our strength from them, and we are so conditioned by their thinking, that I hesitate to set it down unqualifiedly that we regulate anything. If we do, then it is certain that in doing so we discharge our part of this Government's obligation to govern with the consent of the governed. We regulate with the consent of the regulated. I am as proud of that as I am of all the accomplishment that is vouched for in this Report.

Sincerely yours,

A handwritten signature in dark ink, reading "Harold L. Ickes". The signature is written in a cursive style with a prominent underline.

Secretary of the Interior.

Bureau of Mines

R. R. SAYERS, Director

FOREWORD

THE Bureau of Mines in 1943 geared every activity to help supply the United States and her Allies with the mineral commodities essential to victory on all fronts.

Constant modification in the Nation's production schedule, arising from alterations in military logistics and strategy and from other war developments, called for frequent variations in planning and performance by the Bureau and the other war agencies of the Government. As the relative criticalness of the various metals and minerals changed, the Bureau shifted the emphasis of its research and exploratory work rapidly to meet each new challenge.

Coincident with its intensive and far-flung search for deposits of unexploited mineral ores within the United States, the Bureau directed all efforts in its metallurgical laboratories and testing plants toward finding means and processes for utilizing such domestic ores and for developing wider uses of known raw materials in war industries. As a result, hitherto unknown deposits of critical and essential minerals were brought into production, many abandoned mines were enabled to resume operations, and the way was cleared for considerable expansion by a number of going operations. The urgent necessity of carrying out the program with maximum speed made more apparent the lack of an inventory of the Nation's mineral resources at the outbreak of the war.

The exploratory program of the Bureau, conducted in part in co-operation with the Geological Survey, made known substantial additional reserves of bauxite, alumina-bearing clays, and the ores of zinc, iron, copper, vanadium, tungsten, mercury, and other critical and essential minerals, as well as ores of tantalum, magnesia, fluorspar, graphite, celestite, and corundum.

Thousands of samples of ore from deposits explored by the Bureau, and specimens submitted by prospectors, geologists, mining engineers, and property owners were analyzed by the Bureau, and many of these were subjected to beneficiation tests to determine their possibilities for use in the war. The Bureau's engineers and metallurgists successfully completed ore-dressing tests on various ores including several of copper, zinc, and beryllium, demonstrated practical methods for mining and recovering manganese-bearing nodules from the extensive manganiferous deposits of South Dakota, developed a process for treating complex lead-copper-cobalt-nickel ore, advanced the Bureau's pioneering studies in the production of high-purity chromium metal by electrolysis, and carried on, among many other experiments, production of sponge iron from various ferrous ores.

On the basis of the results from its extensive laboratory and field work, the Bureau presented to war-production officials several suggested development programs for aluminum, zinc, lead, copper, manganese, mercury, fluorspar, magnesium, tungsten, and other necessary materials. The difficulty and necessary delay in obtaining essential equipment for its laboratories and pilot plants prevented the Bureau from pursuing its research, testing, and development work with the speed it had set as desirable. Such problems were particularly acute in connection with the projects on sponge iron, alumina, zinc, and electrolytic manganese and various other electrometallurgical processes. The Bureau made available the results of its investigative and research work to the other war agencies of the Government and to private industries with which it had worked cooperatively on numerous projects. The integration of research work was expedited by the establishment during the year of the Interdepartmental Mineral Resources Operating Committee in which the Bureau of Mines represented the Department of the Interior.

The Bureau's knowledge and long experience in fuel testing and research enabled it to make valuable contributions to the war program. As industry pushed to new production levels coincidental with the temporary curtailments of coal output and increasing transportation difficulties, the Bureau was called upon to advise on the substitution of available coals near their points of consumption and on the substitution of coals more suitable to the needs of the particular consumer. Technical advice also was furnished to facilitate production of high-quality metallurgical coke of uniform grade for the steel industry. The Bureau's sampling and testing of millions of tons of coal purchased by the Army and Navy and by other Government agencies, as well as its testing and analysis of boiler water samples, increased the efficiency and power of federally operated plants and at the same time saved the taxpayers many thousands of

dollars. To demonstrate possible saving of fuel oil by industry, particularly in the critical-shortage area of the East, Bureau engineers, in cooperation with private industry, successfully demonstrated the use of colloidal fuel (a mixture of pulverized coal and petroleum) in a commercial boiler. In solving many problems involving the storage of coal and suitability of various different types of equipment, the Bureau worked in close cooperation with the Solid Fuels Administration for War.

The Bureau's long-range studies in petroleum and natural gas proved helpful to industries seeking new production records in special lubricants, high-octane aviation gasoline, materials for synthetic rubber, and similar essential byproducts. Petroleum engineers undertook special tasks at the request of the Petroleum Administration for War and provided data which aided production programs. The Bureau's new petroleum field office at Franklin, Pa., completed nine projects destined to aid the output of aircraft lubricants from the Appalachian region. Production of helium continued upward as the Bureau began operation of a new plant and speeded the construction of several others to assure sufficient supplies of the non-inflammable gas for the Army and Navy and for essential civilian uses.

The Bureau's research on explosives, begun a number of years ago in order to promote the development of safer blasting materials and methods for the mineral industries, increased in volume and in range in response to the call from war agencies for information regarding the characteristics of various explosives. The Bureau's work included examination of high explosives, analyses of seized military devices, studies of the ingredients of Army ammunition, and development of methods of handling explosives and pyrotechnics. In connection with its studies on nonmilitary explosives for use by industry, the Bureau made hundreds of gallery and control tests as well as chemical examinations and brought the total of permissible explosives on its list to 180.

Health, safety, and plant-security programs of the Bureau became more significant during the year as the problem of industry in protecting life and property in the face of accelerated production, longer hours, and labor and equipment shortages became acute. Trained engineers inspected nearly 2,000 mines and related plants under the Facility Security Program of the Government and advised operators how to guard against sabotage, subversive activities, accidents, and other occurrences which might interrupt war production. Federal coal-mine inspectors visited mines in virtually all of the coal-mining States and Alaska and reported the adoption of many Federal recom-

Thousands of samples of ore from deposits explored by the Bureau, and specimens submitted by prospectors, geologists, mining engineers, and property owners were analyzed by the Bureau, and many of these were subjected to beneficiation tests to determine their possibilities for use in the war. The difficulty and necessary delay in obtaining essential equipment for its laboratories and pilot plants prevented the Bureau from pursuing its research, testing, and development work with the speed it had set as desirable. Such problems were particularly acute in connection with the projects on sponge iron, alumina, zinc, and electrolytic manganese and various other electrometallurgical processes. The Bureau made available the results of its investigative and research work to the other war agencies of the Government and to private industries with which it had worked cooperatively on numerous projects. The integration of research work was expedited by the establishment during the year of the Interdepartmental Mineral Resources Operating Committee in which the Bureau of Mines represented the Department of the Interior.

The Bureau's knowledge and long experience in fuel testing and research enabled it to make valuable contributions to the war program. As industry pushed to new production levels coincidental with the temporary curtailments of coal output and increasing transportation difficulties, the Bureau was called upon to advise on the substitution of available coals near their points of consumption and on the substitution of coals more suitable to the needs of the particular consumer. Technical advice also was furnished to facilitate production of high-quality metallurgical coke of uniform grade for the steel industry. The Bureau's sampling and testing of millions of tons of coal purchased by the Army and Navy and by other Government agencies, as well as its testing and analysis of boiler water samples, increased the efficiency and power of federally operated plants and at the same time saved the taxpayers many thousands of

dollars. To demonstrate possible saving of fuel oil by industry, particularly in the critical-shortage area of the East, Bureau engineers, in cooperation with private industry, successfully demonstrated the use of colloidal fuel (a mixture of pulverized coal and petroleum) in a commercial boiler. In solving many problems involving the storage of coal and suitability of various different types of equipment, the Bureau worked in close cooperation with the Solid Fuels Administration for War.

The Bureau's long-range studies in petroleum and natural gas proved helpful to industries seeking new production records in special lubricants, high-octane aviation gasoline, materials for synthetic rubber, and similar essential byproducts. Petroleum engineers undertook special tasks at the request of the Petroleum Administration for War and provided data which aided production programs. The Bureau's new petroleum field office at Franklin, Pa., completed nine projects destined to aid the output of aircraft lubricants from the Appalachian region. Production of helium continued upward as the Bureau began operation of a new plant and speeded the construction of several others to assure sufficient supplies of the non-inflammable gas for the Army and Navy and for essential civilian uses.

The Bureau's research on explosives, begun a number of years ago in order to promote the development of safer blasting materials and methods for the mineral industries, increased in volume and in range in response to the call from war agencies for information regarding the characteristics of various explosives. The Bureau's work included examination of high explosives, analyses of seized military devices, studies of the ingredients of Army ammunition, and development of methods of handling explosives and pyrotechnics. In connection with its studies on nonmilitary explosives for use by industry, the Bureau made hundreds of gallery and control tests as well as chemical examinations and brought the total of permissible explosives on its list to 180.

Health, safety, and plant-security programs of the Bureau became more significant during the year as the problem of industry in protecting life and property in the face of accelerated production, longer hours, and labor and equipment shortages became acute. Trained engineers inspected nearly 2,000 mines and related plants under the Facility Security Program of the Government and advised operators how to guard against sabotage, subversive activities, accidents, and other occurrences which might interrupt war production. Federal coal-mine inspectors visited mines in virtually all of the coal-mining States and Alaska and reported the adoption of many Federal recom-

mentations resulting in safer working conditions and increasing efficiency. Safety engineers and instructors trained almost all employees of the mining and affiliated industries in first aid. Many personal participated in mine rescue and recovery work following disasters.

The difficulties in recruiting, for its wartime mine safety security program, the skilled personnel trained along the high standards fixed by the Bureau handicapped the regular mine safety program inasmuch as the safety engineers experienced in Bureau work and procedure had to be recalled from their established duties to the new inspectors and investigators and to form the nucleus of emergency services.

The Bureau's staff, nevertheless, was successful in conveying to mine operators and to the State departments of mining the Bureau's policies of service and helpfulness to industry and succeeded surprisingly well in obtaining industry's cooperation. The few criticisms were far outnumbered by commendations.

In administering the Federal Explosives Act to prevent sale and other unlawful use of explosives, the Bureau authorized the granting of more than 350,000 Federal explosive licenses to individuals, persons and firms. Special investigators of the Bureau, working closely with Army and Navy representatives and other war agencies, inspected and issued reports on more than 9,000 stores of explosives.

Facts provided by the Bureau regarding the domestic and foreign production, consumption, and uses of minerals helped the various agencies in their allocation, financing, production, and procurement programs. Almost daily, special studies were undertaken by commodity experts to provide special economic and statistical information sought by such agencies as the Army, the Navy, the Metallurgical Service Co., the War Production Board, the Defense Plant Corporation, the Office of Price Administration, the Petroleum Administration for War, the Solid Fuels Administration for War, and the Board of Economic Warfare.

The Bureau's services in this respect included the collection, analysis, and publication of current and periodical data on all mineral commodities, studies of special economic phases growing out of the war, information on some foreign developments, and general economic studies of the mineral situation.

Bulletins, technical papers, Minerals Yearbook chapters, and other books, all concerned with some phase of the war program, were published by the Bureau, but some curtailment in the printing of technical information was necessitated because of the lack of funds. Several film subjects were added by private industry to the Bureau's list.

of free educational motion pictures. These films were shown on hundreds of occasions to classes of the Army, and Navy, and in the civilian industrial training program.

To assure more effective handling of local problems of the mineral industries and to coordinate all phases of the mineral exploration and metallurgical work in the field, the Bureau established, at the close of the previous fiscal year, three regional offices: A Western Region with headquarters at Salt Lake City, Utah, a Central Region with headquarters at Rolla, Mo., and an Eastern Region at College Park, Md., with a regional engineer in charge of each.

In each of the principal mining States or groups of States, an examination office with an engineer in charge was established under the supervision of the regional engineers. Such further decentralization by the Bureau has given it a better understanding of the problems of mining interests in all parts of the Nation, and has encouraged local initiative in mineral development.

FUTURE WORK

Realizing that the United States, despite the United Nations' repeated victories over Axis forces, must be equipped for a war of indefinite duration, the Bureau of Mines rounded out the 1943 fiscal year by planning an even more intensified program to help speed the domestic production of war minerals.

The Bureau received from the Congress approval for the most extensive exploratory program ever attempted—a Nation-wide search for coking coal, quartz crystals, copper, asbestos, zinc, mercury, tungsten, vanadium, beryllium and other pegmatite minerals, corundum, molybdenum, manganese, tin, iron, chromium, bismuth, and nickel and other minerals for which a critical need may arise.

The Bureau's chemists, metallurgists, engineers, and other technologists will continue to seek and devise the best methods of utilizing known and newly proved reserves of minerals, including those which prove too complex or low grade to exploit by the usual methods.

As in the past year, all work of the Bureau will continue on a war footing. Projects which do not directly or indirectly assist the output of war materials or the security of production facilities and manpower have not been considered in the Bureau's program for the 1944 fiscal year.

Included in the Bureau's wartime schedule for the coming months are the following major activities:

A large-scale pilot plant at Laramie, Wyo., is to be completed and studies are to begin in the solid-fuel reduction method of making

sponge iron which can be utilized to supplement the steel scrap necessary for the operation of steel mills.

Exploratory programs and metallurgical research are to be intensified to help increase the production of alumina for aluminum from domestic materials, including low-grade bauxite, clays, alunite, and other alumina-bearing minerals.

Research in reduction of zinc ores by the use of methane gas will be carried out in a pilot plant nearing completion at Rolla, Mo.

Three new plants will be completed in the Southwest to increase the supply of helium by producing each month many additional millions of cubic feet of this essential gas for war purposes.

New and expanded research involving petroleum, natural gas, and various types of coal will be undertaken for the twofold purpose of facilitating production and conserving the Nation's wealth of liquid, solid, and gaseous fuels. The Bureau also will explore methods for recovering and utilizing anthracite "fines" and will organize a Nationwide campaign to promote more efficient industrial uses of fuels.

The highly successful cooperative campaign carried on with the coke and steel industries to increase pig-iron production for war by improving the quality of coke is to be continued.

Various suggested research programs to assist the anthracite industry will be investigated, such as the prevention of floods, increased production by mechanical mining, industrial fuel oil and oil from anthracite, prevention of fires, protection of equipment from acid mine waters, and the use of anthracite as a fuel for portable gas producers.

The Bureau's long-established policy of gathering and maintaining up-to-date information regarding all phases of domestic mineral production and many of the activities in the foreign minerals field will go forward on a broader basis to serve war agencies relying on this important service.

SUMMARY OF ACTIVITIES

TECHNOLOGICAL WORK

Exploration and Metallurgical Research

Industries of the United Nations called for unprecedented quantities of war materials, and the Bureau of Mines quickened and broadened its search for metals and mineral products, sending its exploratory crews into new areas and maintaining day-and-night schedules in pilot plants and laboratories. Technical information was provided for field crews, the mining and metallurgical industries,

and others vitally concerned with production. To hasten the movement of raw materials from the ground to production lines, the Bureau's three regional engineers maintained close contact with and directed the work of district and project engineers assigned to mineral-rich areas of the United States and Alaska.

Because of the constantly changing economic situation in the mineral commodity field, the Bureau adapted its exploratory work and metallurgical research to increase the domestic output of the most-needed materials in the shortest possible time.

Beneficiation methods were worked out for ore samples submitted by the Bureau's own exploratory crews and by individuals and other Government agencies. Large-scale process projects were undertaken in sponge iron, magnesium, manganese, and alumina under special appropriations from Congress.

During the fiscal year, the Geophysical Division of the Geological Survey was transferred to the Bureau of Mines to aid in the exploratory work. One-third of the division's activities was devoted to a special project for the Navy.

The advancements made by the Bureau in the field of war minerals are reflected in its progress reports for various commodities.

Iron and steel.—The 1943 program to help the Nation maintain its steel-production schedules included continued exploration of the iron ore deposits of the West to serve the newly established steel industry of the Pacific coast, expanded research in sponge iron, laboratory tests of the amenability of ores to concentration, and assisting in the recovery of ore pillars in a New York iron mine by employing Bureau-developed seismic instruments. Major explorations for iron ores were carried on in Utah, Arizona, Oregon, Nevada, New Mexico, Missouri, Iowa, and Alaska. Attention also was directed toward increasing the output of iron ore easily available to eastern blast furnaces.

Small deposits of iron ore, suitable for the production of sponge iron, have been located in 20 States, and during the fiscal year the Bureau's experiments in sponge iron emphasized the possibility of using idle commercial facilities, such as brick kilns, for the production of sponge iron to supplement steel scrap. Sponge iron research progressed at brick kilns in Binghamton, N. Y., and Canton, Ohio.

Preliminary to the operation of its large-scale rotary-kiln pilot plant at Laramie, Wyo., the Bureau produced sponge iron in a rotary kiln at its Boulder City (Nev.) Experiment Station and also in cooperation with a Pennsylvania iron company. Studies in the natural-gas reduction method for making sponge iron continued at a plant in Texas.

To increase the domestic production of fluorspar for steel-furnace flux, extensive dewatering and exploratory work was carried on in the Illinois-Kentucky field, leading producer of fluorspar for the eastern steel industry, and an important potential producer of fluorspar was established by Bureau drilling in Utah to serve the western steel industry. Meanwhile, the Bureau carried on its laboratory work in the concentration of fluorspar, having pioneered and developed improved techniques for the use of concentrates in steel furnaces.

Ferro-alloys.—The increased use of ferro-alloys by industries turning out war equipment prompted the Bureau to carry out exploratory and metallurgical work on chrome, manganese, cobalt, molybdenum, nickel, tungsten, and vanadium.

Exploration was completed on the Bureau's outstanding chrome project in Montana in which several million tons of concentratable ore were charted. This ore now is being mined on a large scale. Several other projects in California, Montana, Oregon, and Alaska resulted in commercial operation. The Bureau's laboratories developed methods for the concentration of some chrome ores, including the chromite beach sands of Oregon. Research disclosed that off-grade chrome concentrates can become high-grade metallurgical products by chemical treatment and pilot-plant work indicated the commercial practicability of the process. Further strides also were made in the Bureau's process for producing high-purity chromium metal from low-grade chromite by electrolysis, the consumption of electricity per pound of metal being much lower than that of ordinary chromium plating.

A substantial tonnage of cobalt-copper ore in Idaho was indicated by the Bureau. The metallurgists developed a suitable method for recovering both cobalt and copper in separate concentrates and worked out a process for recovering lead, copper, nickel, and cobalt in three concentrates from a complex lead-copper-nickel-cobalt ore of Missouri.

Investigating further the production of electrolytic manganese by a Bureau-perfected method, the technologists learned that cobalt, a minor constituent of manganese ores, can be removed effectively from the manganese electrolyte. Small pilot-plant investigations, looking to the utilization of cheap hydroelectric power of the West, were conducted on the separation and recovery of cobalt and nickel from complex ores by employing electrodeposition.

The domestic manganese potential was improved when the Bureau demonstrated practical methods for mining and recovering manganese-bearing nodules from the 10,000,000 long tons of readily minable shale which have been delineated in the Chamberlain area of

South Dakota. Simultaneously, larger-scale tests continued in the matte smelting of nodules to recover manganese, and plans were prepared for exploiting the ore by employing the Bureau's smelting process.

Several millions tons of low-grade nickel ore were indicated by exploration in Colorado, Montana, Oregon, Washington, and Alaska. While nickel cannot be produced economically from these ores by standard methods, it could be extracted at a higher cost should the need for the metal become more acute.

In the Cle Elum-Blewett Pass region of Washington there are indications that a large tonnage of ore containing 0.75 to 1 percent nickel may be developed. While the Bureau continued exploration of this area, a process was developed whereby the ore, containing iron, nickel, and chromium, can be smelted in an electric furnace to produce a nickel-iron alloy having 13 percent or more nickel with virtually complete recovery of the nickel, thus yielding an immediately useful melting stock directly from the ore.

The widespread use of tungsten for special steels in armor plate, guns, and projectiles and other war equipment prompted the Bureau to place still greater emphasis on methods for increasing the Nation's output of this material. During the year more than 100 tungsten properties were examined, 10 exploratory projects were begun and 7 of these—in Idaho, Colorado, Nevada, Wyoming, New Mexico, and Alaska—were completed, and more than 500,000 tons of low-grade ore were indicated. Two projects were outstanding. In Lincoln County, Nev., several hundred thousand tons of tungsten ore were indicated, and in Lemhi County, Idaho, sufficient reserves were charted to supply a 200-ton-a-day mill.

The Bureau's exploratory work in vanadium included projects in the active Colorado-Utah field and the potentially important western Wyoming area. The Bureau conducted laboratory studies of the recovery of vanadium from the Wyoming ore.

Nonferrous metals.—Although the United States is the world's largest producer of zinc and copper, mine output has failed to keep pace with requirements. The Bureau made consistent gains in helping increase their production.

In copper alone 17 exploratory projects were undertaken and 872,000 tons of copper ore containing 33,000,000 pounds of copper were discovered. In Vermont, sufficient reserves of ore were indicated to merit construction of a mill, and this plant went into production in March 1943. In Idaho, 75,000 tons of ore assaying 2 percent copper and 0.3 percent cobalt were indicated. In a southwestern mine, the finding of additional ore justified the expansion of mining operations. An idle

western mine resumed operations after the Bureau's field crews discovered high-grade copper.

To speed the conversion of ore to metal, the Bureau conducted successful ore-dressing tests on materials from three deposits. These tests were (a) for the separation of tungsten from copper minerals; (b) for the selective flotation of copper and cobalt minerals; and (c) for the leaching of copper.

Equally impressive were the gains made in zinc. The Bureau's 20 exploratory projects conducted in 14 States revealed 8,000,000 tons of zinc and zinc-lead ores. Programs now are under way for mining and milling 7,000,000 tons of the newly found reserves. Correlated laboratory tests established ore-dressing methods both for reserves discovered by the Bureau's crews and for a wide range of other ores. As another aid to the zinc industry, the Bureau began construction of a pilot plant at Rolla, Mo., to study the reduction of zinc ores with methane gas.

Seven exploratory projects for mercury were active through the year, and the known reserves of ore were increased by 600,000 tons. This ore averages 4.7 pounds of mercury per ton. In Valley County, Idaho, an exploratory project was completed after 133,500 tons of mercury ore had been indicated. As a result, the output of a mine was doubled. In southwestern Alaska, an exploratory crew charted 115,000 tons of ore containing 9 pounds of mercury per ton. Other work in mercury included the preliminary sampling of 11 deposits in Nevada.

An initial shipment of high-grade tantalum ore from a deposit in New Mexico was concentrated in the Bureau's pilot mill at Rolla, Mo., and exploratory drilling by Bureau engineers revealed the most extensive source now known in the United States. Tantalum is in heavy demand for special war uses, particularly in vacuum tubes for radios and surgical and dental instruments.

Other activities in the nonferrous metals field concerned beryllium and tin. Exploratory work was conducted on beryl-bearing pegmatites in New England, and a drilling crew was sent to the rare helvite deposit at Iron Mountain, N. Mex. Ore from Iron Mountain was tested to ascertain the most feasible method of extracting the beryllium, and new ore-dressing processes were developed to separate beryl from its ores.

Despite adverse weather and difficult terrain, the Bureau's exploratory crews continued their search for tin in Alaska and reported that, although domestic tin reserves are small as compared with foreign resources, the most extensive known sources of tin possessed by the United States are on the Seward Peninsula. Meanwhile, other exploratory work for tin was carried on in Nevada and New Mexico, and

additional deposits in South Dakota, Montana, Idaho, California, and Texas were sampled.

Light metals.—Anticipating the Nation's demands for more aluminum and magnesium for airplanes and other war equipment, the Bureau continued on a larger scale its correlative exploratory, laboratory, and pilot-plant projects for increasing the domestic output of these metals.

Exploratory crews increased the known reserves of bauxite by more than 10,000,000 tons, although much of it proved too low grade for existing plants, which are geared to high-grade imported bauxite and the limited amounts of best-grade domestic bauxite. The Bureau ascertained that much of the low-grade bauxite can be concentrated to produce a suitable feed for the alumina-producing plants (Bayer plants) and proposed to the War Production Board that a mill be constructed in Arkansas to beneficiate the large reserves of low-grade material. By so doing, Bureau engineers ascertained, the low-grade material could be utilized quickly without new facilities other than a mill.

Other exploratory crews established additional reserves of alunite, another alumina-bearing material, which will be mined for alumina plants authorized in Utah by the War Production Board. At the same time, Bureau crews drilled clay deposits in various parts of the Nation and reported that large quantities of aluminous clay are available. In a 12-month period the exploratory crews charted 100,000,000 tons of alumina-bearing clays, and the Bureau's chemists and metallurgists worked unceasingly on methods of utilizing these clays and other low-grade aluminiferous materials, including alunite, to produce alumina. Partly as a result of these studies and the efforts of the Department of the Interior to demonstrate the need for using the Nation's extensive reserves of clay for aluminum production, the War Production Board approved the construction of five plants in Utah, South Carolina, and the Pacific Northwest, each with 50 tons daily output of alumina from materials other than bauxite.

Many months of study in the Bureau's laboratories and pilot plants at Boulder City, Nev., resulted in the development of a process to produce magnesia from a 400,000,000-ton dolomite deposit near Las Vegas, Nev., in the Boulder Dam area. The dolomite deposit is in the vicinity of the Basic Magnesium, Inc., plant, and utilization of the Bureau's process could eliminate a difficult transportation problem because material now used for the plant is transported more than 1,000 miles by rail. In addition to the process worked out for Sloan dolomite, the Bureau advanced in its studies in producing magnesia from impure magnesite by the acid-leaching process. At the same

time, small-scale pilot-plant work was completed on the Bureau's newly developed method of producing magnesium metal directly from magnesite made either from the dolomite or from impure magnesite. Other research by the Bureau in the carbothermic reduction process for producing magnesium from magnesite is continuing.

Large quantities of iron-free alum are needed urgently in the war program for use as a catalytic agent, and the Bureau's chemists developed a process for obtaining this product from domestic clays.

Nonmetallic minerals.—Largely because of the Bureau of Mines' work, the United States was freed from dependence upon imported talc suitable for high-frequency insulators in military radio equipment. Prior to the war only one mine in the United States produced a satisfactory-grade talc for this purpose, but examination, testing, and processing of talc deposits by the Bureau revealed that sufficient supplies are available from domestic sources. Millions of radio insulators for planes, tanks, and ships were processed in a Bureau laboratory.

Since more flake graphite is needed for war uses—as a lubricant, for foundry facing, and in the manufacture of crucibles, stoppers for steel ladles, and core washers—The Bureau explored two groups of flake graphite deposits in Alabama and proved the existence of 1,174,000 tons of measured ore. Following the Bureau's work, three graphite mills, under the WPB program, were constructed or rehabilitated and put into operation in the Alabama field. Graphite prospects also were examined by the Bureau in Pennsylvania, New York, and Texas.

Exploration of Texas celestite (strontium) established 130,000 tons of celestite which can, if necessary, be concentrated to meet the requirements for military pyrotechnics. Strontium minerals are used chiefly for tracer bullets and flares, military experts looking upon strontium as the best all-around tracer for both day and night use.

Activity increased in the examination of domestic deposits containing abrasive-grade corundum for grinding optical glass. Five former corundum mines were visited by the Bureau, and four were recommended for exploratory projects.

Research workers in nonmetallics prepared a syllabus for the qualitative testing of domestic clays to ascertain their adaptability to specific uses in place of clays formerly imported.

Coal and Coal Products

Increased production of high-quality coke of uniform grade, testing of thousands of coal samples, efficient storage of millions of tons of coal, production of synthetic liquid fuels from coal, conditioning of water fed to Government boilers, and conversion of heating systems

from oil to coal headed the many war problems studied by the Bureau of Mines as the Nation leaned more heavily on solid fuels.

In a 12-month period nearly 23,000 samples of coal were analyzed in connection with fuel purchases by Government agencies, particularly the millions of tons used by the Army and Navy. Testing all coal purchased by the Army, the Bureau's coal-sampling trucks visited 500 mines in 18 States and obtained 1,500 specimens. The volume of work in the testing of water fed to boilers was doubled, lengthening the life and increasing the efficiency of Army boiler plants.

Coal analysis.—While coal sampling for Government purchases continued on an expanded scale, the Bureau's work in coal analysis likewise increased tremendously because of the coal-dust samples submitted by coal-mine inspectors in their work of promoting health and safety in the Nation's mines. More than 10,000 of these samples were analyzed.

Coke studies.—With the Nation's wartime steel-production schedules calling for more metallurgical-grade coke, the Bureau sent a mobile laboratory into the beehive field to provide operators with technical data that were essential in the production of better-grade coke of uniform quality. The Bureau's work in fostering the output of cleaner coal and adoption of improved coke-plant practices probably helped prevent the closing of some war plants running short of suitable metallurgical coke. A scarcity of petroleum coke led the Bureau to develop a method for producing, from low-ash coals, electrode carbon suitable for use in aluminum plants.

Coal storage.—To insure sufficient supplies of coal, industry began storing larger amounts in off-peak periods. Many of the storage and procurement problems that arose were solved through the help of the Bureau. Information was supplied regarding the best methods of storing particular coals to avoid spontaneous combustion and other hazards which cause loss. Special assistance was provided operators of docks in the Great Lakes area in preventing deterioration and possible loss in more than 50,000,000 tons of stored coal. Other Bureau experts tested the efficiency of various materials for excluding air from subbituminous coal stored for use by the Army and Navy.

Colloidal fuel.—In cooperation with an oil company, a method was developed for making colloidal fuel—a mixture of pulverized coal and oil—to relieve fuel-oil shortages created by the war. Tests in commercial plants proved this fuel can be employed satisfactorily with reasonable attention to maintenance of proper conditions.

Liquid fuels from coal.—The continuing decline in the discovery of new oil pools in the United States, heavier wartime consumption of natural petroleum, and transportation difficulties threw greater

emphasis on the Bureau's research in producing synthetic liquid fuels from coal. Earlier tests on 14 American coals, including lignite, subbituminous, and high-volatile bituminous types, proved that fuel oil, Diesel oil, motor gasoline, and aviation gasoline can be obtained from them by hydrogenation.

Experiments progressed in the operation of the laboratory-scale pilot plant for the direct hydrogenation of coal, and laboratory-scale investigations were begun on the indirect process for making synthetic gasoline from water gas derived from coal. While two members of the Bureau's staff visited coal-liquefaction plants and research laboratories in England, a measure was introduced in Congress proposing the construction and operation of demonstration-size plants by the Bureau to pave the way for ultimate commercial production by private industry of liquid fuels from coal, oil shales, and other materials.

Fuel conservation.—The progress made in determining the causes of corrosion of boiler-furnace wall tubes resulted in means of preventing further loss of steaming capacities in electric power plants. Cooperating with the Solid Fuels Administration for War, municipal authorities, trade and manufacturing associations, engineering societies, real estate boards, publishers, and other interested groups, the Bureau of Mines participated in a fuel efficiency campaign to conserve supplies of gaseous, liquid, and solid fuels for the war. Programs of this nature in certain Government plants already have resulted in fuel savings ranging from 9 to 20 percent.

Safety and efficiency.—To conserve electricity, Bureau engineers issued findings describing how the use of electricity can be cut down in coal mines. Other tests indicated that rock dust, used to minimize explosion hazards in coal mines, does not hasten the decay of mine timbers. In minimizing hazards in war industries, research workers determined the explosibility of various dusts and safer methods for their control.

Petroleum and Natural Gas

As the growing power of the United Nations' fighting strength increased the demands for special lubricants, liquid fuels, and the wide variety of petroleum byproducts necessary for maintaining supremacy of the land, sea, and air, the Bureau of Mines enlarged its schedule of technical research to assist the petroleum and natural-gas industries in meeting wartime production goals.

Special projects were begun to inventory crude oil for war needs, to apply improved methods for producing petroleum, and to determine new and additional sources of petroleum products. Throughout the year, war agencies and industry drew heavily from the

Bureau's fund of technical information on various crude oils, condensates, and natural gasoline, making possible the more efficient blending of aviation gasoline and the manufacture of toluene and benzene from petroleum in large quantities.

The engineers studied deep, high-pressure fields of the condensate type and prepared reports on four important fields in the Gulf coast for the Petroleum Administration for War which permitted PAW and the operators to develop programs for producing the optimum amounts of liquid hydrocarbons and at the same time prolonging the life of the fields.

A mobile field laboratory was built by the Bureau to determine the composition and phase relations of reservoir fluids—information which was necessary in developing operating plans which will leave minimum quantities of liquefiable products in the sands. Several months of field testing and study were devoted to a complicated natural-gas reservoir in Oklahoma supplying war industries. The Bureau's continuing study of the effect of well spacing on the quantity of extractable oil grew in importance because of the scarcity of steel for drilling new wells.

Engineering reports were prepared on an analysis of the oil-producing history of the Mexia-Powell fault-line fields of Texas, studies of Rodessa field in Louisiana, Texas, and Arkansas, and reservoir conditions of the Magnolia field in Arkansas. Reservoir fluids were analyzed to assist operators in the Cut Bank field of Montana in determining optimum production rates.

Water flooding and air- and gas-repressuring methods, employed to increase the extractable oil with a minimum use of material and labor, were studied and reports were issued on water flooding in Oklahoma and on brine-disposal systems in western Kansas. Bureau technicians ascertained that salt water produced with oil can be conditioned and used as a repressuring medium in several areas.

To assist the 15,000 oil producers in the Appalachian region, the Bureau established a petroleum field office at Franklin, Pa., in April 1942, and this office reported during the fiscal year on nine air- and gas-injection projects in widely separated parts of the Appalachian region and on the cost of reconditioning wells to guide further efforts in stimulating the production of paraffinic oils needed for aircraft lubricants.

A chemical engineering study of the proper blending of oil-base drilling fluids suggested that they may prove extremely valuable in increasing the supplies of recoverable crude oil. The Bureau also published a report on the tools and techniques employed in rehabili-

tating wells which require the removal of sand, mud, and other obstructions.

Research work on aviation gasoline was expanded to include both natural and synthetic components, and exacting analyses were made on crude oils, condensates, and natural gasolines to find new sources of aviation gasoline, toluene, and benzine. Several crude oils were analyzed by superfraction action and 17 naphthas from high-sulfur crude oils were desulfurized and tested for octane rating and tetra-ethyl lead response. Other research continued in the analysis of asphaltic materials, and plans were laid for constructing an experimental plant to recover microcrystalline wax from waste for munitions and other war uses.

During the year 132 special reports were prepared on properties of materials available from particular crude oils and distillates for war uses. The Bureau also resumed its semiannual survey of motor gasoline. At the request of the PAW, work was begun on the thermodynamics of hydrocarbons and derivatives primarily as an aid to the synthetic rubber program.

Helium

Meeting greatly increased demands for helium for the Navy's anti-submarine blimps, for meteorological balloons of the Army, Navy, and Weather Bureau, and for Army barrage balloons, the Bureau of Mines completed its new helium plant in Texas, modified and supplemented the equipment of its Amarillo plant in Texas and rushed construction of three other helium plants. Production of this lightweight, noninflammable gas was increased to about 25 times that of pre-war days and was meeting the current requirements for military and civilian uses. Additional wells were drilled in the famed Cliff-side helium-bearing gas field of Texas. While the armed services used most of the helium, considerable quantities also were employed for medical purposes, in diving and caisson work, and in the welding of magnesium airplane parts.

Explosives

The experience of the Bureau of Mines in handling and testing explosive and inflammable materials used by the mineral industries provided an ideal background for the successful completion of important research for the War and Navy Department and other war agencies. While continuing their normal research in the causes and prevention of industrial fires and explosions, experts carried on investigative work under the Bureau-administered Federal Explosives Act, working

closely with representatives of the armed forces, particularly the Safety and Security Branch of Army Ordnance, which named several Bureau men to technical boards and committees.

Certain new types of ammunition were analyzed for the Ammunition Development Branch of Army Ordnance, and other studies were made in the handling of explosives and pyrotechnics. At the request of the Army Engineer Board, all available military high explosives were examined to determine physical characteristics important to demolition work. Such tests included rates of detonation and the action of humidity and subsurface moisture at extreme ranges of temperature. Other studies involving explosives were conducted for the Navy Department, the Bureau of Standards, and the Board of Economic Warfare.

Typical problems of a confidential nature concerned the action and construction of seized enemy military devices and the clearing of land mine areas. New methods for testing explosives were devised at the request of military authorities.

Despite the increased volume of war work, technical experts made consistent gains in obtaining data regarding commercial explosives. In this field of activity 149 chemical analyses were made, 967 gallery tests were completed, and 2,248 control tests of a physical nature were conducted. At the close of the fiscal year, 180 explosives were on the Bureau's permissible list as being safer to use in mines. Also specifications were developed for Diesel engines that may be operated safely in mines and in other confined spaces, such as ordnance plants and synthetic rubber plants where inflammable atmospheres may be encountered.

Gas- and dust-explosion research.—Other services for war industries and agencies included determinations of the inflammability characteristics of gases and metallic and nonmetallic dusts. Considerable study was devoted to the prevention of explosions involving butadiene, a principal constituent in the manufacture of synthetic rubber. The dusts of aluminum, antimony, cadmium, chromium, copper, magnesium, tin, zinc, and other war metals were tested and industries were advised regarding precautionary measures which should govern their handling.

SAFETY, PLANT PROTECTION, AND HEALTH ACTIVITIES

Loss of skilled manpower in the mineral industries, equipment shortages, and the plea by war agencies for increased production, formed the backdrop for greatly expanded safety and security programs executed by the Bureau of Mines. Safety education, accident-prevention work, investigative activities, and testing of materials

were aimed at the conservation of men and machinery. Despite increased production, additional man-hours of labor, and the employment of many inexperienced workers, the anticipated upward trend of accidents in the mineral industries was relatively small.

Under the Federal Coal Mine Inspection Act of 1941, inspectors visited a larger number of coal mines during the fiscal year in their duties of furthering health and safety in this vital field of production. Safer storage, handling, transportation and use of commercial explosives resulted from the Bureau's administration of the wartime Federal Explosives Act. Public and industrial security was enhanced as operators of mines, metallurgical plants, quarries, and similar plants responded to Bureau recommendations for means of preventing sabotage and subversive activities.

Safety Work

The experienced safety engineers of the Bureau performed valuable service in directing and assisting in the administration and field activities of coal-mine inspection, the explosives control program, and mineral production security activities. During 1943, engineers and safety instructors trained 45,952 employees of the mining and affiliated industries in first aid, and the total completing such courses under the Bureau's sponsorship reached 1,584,774. About 675 persons qualified as first-aid instructors, swelling the ranks of persons so trained to 16,500—a vital link in the program of civilian defense training. Forty-nine plants received certificates attesting to the training of all employees in first aid. Certificates were awarded 72 persons as qualified first-aid judges, and Bureau workers aided in conducting 42 first-aid contests in 8 States.

Basic mine rescue training, which has saved the lives of many industrial workers, was given to 2,498 mine workers; and 154 persons completed the advanced course. Because of their ability to use rescue equipment and their knowledge of rescue and recovery procedures in connection with fires, floods, and other disasters, these men can serve effectively in civilian defense work.

Bureau engineers investigated 41 mine explosions in 14 States, 30 mine fires in 16 States and Alaska, and 97 miscellaneous accidents in 26 States during 1943. They participated, in many instances with hazard to themselves, in rescue and recovery operations involving explosions, fires, and floods, and helped fight numerous mine fires.

At the request of the owners, careful inspections were made of 63 privately owned mine rescue stations. Meanwhile, accident-prevention training continued to grow in popularity, 566 persons enrolling

in these courses and bringing the number completing such instruction to 10,865 and those receiving partial training to 6,450.

Motion pictures, slides, exhibits, testing galleries, and other mediums were employed in the safety education program. Sound motion pictures on safety subjects were shown 208 times. Bureau representatives participated in 547 safety meetings in 33 States.

To determine the degree of safety afforded by electrical machinery and equipment for use in mines, the Bureau continued its special testing work on devices submitted by manufacturers. Formal approvals covering 35 complete machines were issued and 19 formal letters of suitability were granted covering individual parts, together with 48 extensions of letters of suitability for safe use against gas and dust ignitions. The Bureau also made 589 explosion tests for the Navy of explosion-proof enclosures intended for ships.

Coal-Mine Inspection

The numerous safety improvements made voluntarily by officials and workers in coal mines were among the concrete results of the Federal coal-mine inspection program. Lower accident rates in many mines in spite of increased output due to the war and the receipt of many letters from both company spokesmen and workers' organizations commending the manner in which Bureau of Mines representatives conducted the investigations attested to the success of the inspection work.

During the fiscal year, Federal inspectors visited 1,149 coal mines in 22 States and Alaska, representing a combined annual production of 293,218,266 tons, or 46 percent of the total annual 1942 coal production. These mines employed a total of 233,160 men. Since Federal inspections began on December 1, 1941, 62 percent of the coal mines employing more than 25 persons each have been inspected; these mines employ 66 percent of the workers.

Recommendations designed to increase safety and promote healthful conditions were made by the Federal representatives and mines were credited for existing safeguards and for improvements effected subsequent to the inspector's visits. State mine-inspection departments cooperated with the Bureau by requiring compliance with State mining regulations and urging adoption of many suggested safety measures not included in State statutes, but recommended in Federal inspection reports.

Ventilating improvements made as a result of Bureau of Mines inspections have, the Bureau believes, prevented some mine explosions. Very few companies disregarded the Federal recommendations or

deliberately delayed in carrying out certain improvements; there were several mine explosions and other accidents in mines which, in the opinion of the Bureau, would not have occurred had Federal suggestions been followed.

Special investigations regarding explosives and electrical equipment in mines were made by mining-explosives engineers and mining-electrical engineers of the inspection staff and other special studies of mine hazards and problems were undertaken by coal-mine inspectors.

Explosives Regulation

Guarding against sabotage and misuse of the hundreds of millions of pounds of explosives used annually in the United States in commercial operations, the Bureau of Mines tightened its surveillance over the manufacture, purchase, sale, storage, use, and possession of non-military explosives and their ingredients as authorized under the Federal Explosives Act. By a system of licensing, Federal control of explosives was maintained from the manufacturer to the lawful consumer. Fifty-two explosives investigators were stationed in various States and Alaska to supervise and guide the 4,500 Federal licensing agents and to investigate the handling, storage, and use of explosives. The licensing agents, who serve without pay except for the 25-cent fee they are entitled to collect from each person to whom they deliver a license, issued about 350,000 licenses to vendors, purchasers, and foremen during the year. The Bureau examined and acted upon 4,000 additional applications from manufacturers, schools and colleges, and laboratories.

Investigative work under the Federal Explosives Act was woven closely with the safety and security programs of the Bureau. Investigators made reports on more than 9,000 stores of explosives and were assisted by other engineers and technicians of the Bureau of investigating fires and explosions in mines, quarries, munitions plants, and factories manufacturing fireworks for military and industrial purposes.

In carrying out its duties under the Federal Explosives Act, the Bureau maintained liaison with the Army and Navy Intelligence services, the Office of Civilian Defense, and the Office of the Chief of Ordnance of the Provost Marshal General.

Antisabotage

Strengthening home-front production and supply plants against losses due to sabotage, subversive activities, injuries to workers, fires, floods, and other eventualities, the Bureau of Mines sent a corps

of specially trained engineers into 1,968 mines and related facilities during 1943 under the facility security program.

At the request of the Provost Marshal General's office, the Bureau of Mines assisted in the inspection of mineral facilities and undertook inspections for the security status of surface and underground workings of all mines, including those on the Army's master responsibility list. Joint inspections were made by Army officials and Bureau engineers, and recommendations were jointly approved by the War Department and the Bureau before they were transmitted to the operators. Bureau engineers acted for the War Department in making recurring inspections of mines and related facilities on the Army's list and submitted reinspection reports to Service Command headquarters.

In addition to the many original inspections made during the year, the Bureau's small field staff of 65 engineers assigned to mineral-production security work made 132 reinspections to check improvements made since the initial inspections. Reports received by the Bureau indicate that these inspections resulted in the adoption of many precautionary measures to prevent sabotage and subversive activities and curb accidents.

Mineral-production security inspectors, as well as Federal coal-mine inspectors and other field workers of the Bureau, because of their familiarity with mines in all parts of the country, assisted in the scrap-metal drive by locating scrap material in abandoned and active mines and by helping in its recovery or rehabilitation.

Health in the Mineral Industries

Increased production of essential war materials by preventing occupational diseases and improving the efficiency and morale of the workers through better environment was emphasized by the Bureau during the year.

Inspections were made of the hygienic aspects of working conditions in anthracite mines and zinc, manganese, and ordnance plants, and suggestions were made for eliminating or controlling hazards. Several investigations were made at the request of the Navy Department regarding health and safety aspects connected with certain of its operations.

The field investigations and studies made by other Bureau engineers required the analysis of approximately 12,000 air samples, compared with 5,300 in 1942. About 400 dust samples also were tested. Approximately 10,000 air samples were analyzed for Federal coal-mine inspectors and other field workers. Five hundred air samples were analyzed for the Army and Navy, and 1,500 samples were tested

as part of the research work regarding the safety of electrical mining equipment, respiratory protective devices, and similar equipment. Dust samples were tested as part of the health and safety surveys in mines, studies in explosives and coal hydrogenation, and in aiding research work conducted by the Army.

The protection of workers against noxious gases, fumes, and dust grew increasingly important as a wartime health measure, and demands for Bureau-approved respirators increased along with requests for suggestions regarding their correct use and care. Such requests came from various mines, labor organizations, ordnance plants, the Maritime Commission, and others concerned with war production. Special tests also were made by the Bureau for the armed forces and the Maritime Commission to obtain certain information regarding respirators.

ECONOMICS OF MINERAL INDUSTRIES

Since dwindling margins between wartime requirements and domestic production of many of the leading mineral commodities during 1943 required closer control of their distribution and uses, there were steadily increasing demands on the Bureau of Mines for comprehensive statistical and economic information to guide those charged with maintaining adequate supplies of mineral products.

Both the volume and frequency of the information surveys handled by Bureau experts climbed to new levels, many special studies were undertaken, new services were inaugurated, and scores of conferences were held to provide executive legislative branches of the Federal Government with factual data.

Partly because of the unusually heavy pressure of war activities and the necessity of maintaining secrecy regarding sources, production, reserves, and uses of many commodities, publication of the 1941 Minerals Yearbook was delayed. This authoritative publication included 14 chapters on critical and essential minerals which could not be released for general distribution and the Yearbook thus was issued as a confidential document for the use of a limited number of Federal officials. Certain other chapters containing important data, but not considered in the category of being of "aid and comfort to the enemy," were distributed after deletion of certain tables and other confidential material.

Metals

Continued expansion of plant facilities and the resulting accelerated tempo of production placed a heavy strain on the Nation's supply of metals. The supply of such metals as aluminum, cadmium,

tin, magnesium, copper, zinc, molybdenum, nickel, vanadium, tungsten, and chromium was insufficient for both war and civilian demands. The Bureau conducted monthly or quarterly surveys of these materials and more than a score of other commodities, and in many instances this information was utilized by the War Production Board in determining its allocation systems.

In 1942 many additional studies in metal production and consumption were undertaken, and this trend continued upward during 1943 as war agencies, particularly the WPB, called for up-to-date confidential data on a larger scale.

During the year, 415 confidential reports were distributed to war agencies and 35 nonconfidential reports were released to industry. New monthly or quarterly reports were undertaken on cobalt, iron ore, selenium, tellurium, vanadium, zirconium, lead and tin scrap, and zinc scrap. In addition, 26 chapters were prepared for the Minerals Yearbook.

Monthly reports giving the mine production of copper, lead, and zinc by individual workings were employed by the joint War Production Board-Office of Price Administration Quota Committee in forming bases for control and were used extensively by other war agencies. In conjunction with Bureau of Labor Statistics reports on mine employment, the Bureau of Mines information was used by the War Manpower Commission and other agencies in mine labor and productivity problems. The series of monthly reports for the production of copper, lead, and zinc by States was extended to include gold and silver. Field offices of the Bureau assigned to the compilation and interpretation of mineral production information served in an advisory capacity to other Federal agencies concerned with mining problems, particularly in the Central and Western States. In addition, Minerals Yearbook chapters on the production of gold, silver, copper, lead, and zinc were prepared.

Accident and Health Data

Requests from agencies of the Federal Government and various non-Federal offices for facts regarding accidents and production in mines were used in programs involving the protection of plant facilities, the placement of prisoners of war, and the distribution and utilization of manpower for maximum benefit to war-production schedules.

To reduce the number of reports from industry and to promote uniformity of basic information concerning accidents in coal mines, conferences were held with State mining officials and State compen-

sation and industrial commissions regarding the merits of a standard report form. This form was suggested for companies providing accident information to States and to the Bureau of Mines. Through the cooperation of the National Coal Association and State associations of coal companies, the conference resulted in the adoption of a single standard report form by States producing 85 percent of the Nation's coal. The Bureau began a preliminary survey to obtain accident data in the petroleum industry. Other informational services included the annual production, consumption, and distribution of commercial explosives and the estimated quantities of nitroglycerin and other ingredients used in the manufacture of blasting materials.

NONMETALLICS

The Bureau of Mines conducted 18 surveys in the nonmetallic industries during 1943, many of them being undertaken at the specific request of officials in other agencies of the Government. Typical of these were facts regarding the availability of mica for airplane spark plugs, asbestos for fireproof wire coverings, magnesia for refractories, cement for airfield runways, gypsum for military housing, mineral pigments for camouflage paints, and celestite for tracer bullets and flares.

From the Bureau's storehouse of information came answers to the approximately 500 inquiries received each month. Data files, started a quarter of a century ago and augmented each year by the addition of from 4,000 to 5,000 new items, supplied basic information which led to the solution of many war problems.

Research workers prepared 21 chapters for the Minerals Yearbook and compiled 48 other publications regarding nonmetallics, 10 of which concerned such vital subjects as furnace refractories, strategic mica, kyanite, lithium, mineral pigments, olivine, a review of mineral progress, and home insulation with minerals to promote the conservation of fuels. Studies were begun regarding cement developments in Latin America and the functions of corundum, vermiculite, and minor fertilizer materials in the military program.

Mineral Trade Notes, comprising abstracts of consular reports and special contributions primarily concerning foreign mineral developments, was prepared monthly for the confidential use of certain war agencies.

Petroleum and Natural Gas

Gasoline and fuel-oil rationing, transportation changes, and ever-rising war needs for petroleum products multiplied the difficulties

of the Bureau of Mines in forecasting demands for motor fuel and crude petroleum, but monthly reports were continued successfully and the cumulative forecasts showed an approximate divergence of only 1 percent from actual demand.

While the preparation of regularly supplied information proved extremely useful to war agencies, special studies also were requested for certain supplemental material regarding petroleum and natural gas and these surveys were undertaken immediately by the Bureau. Outstanding among the regular services was the survey on the production, stocks, and demand for aviation gasoline. Bureau statistics were combined with those from other sources to maintain a complete check on the trends of supply and consumption in the critical Atlantic and Pacific coast areas. Information was obtained in the field of international petroleum trade for agencies concerned with export control and demand.

Anthracite and Coke

Expanding its work in collecting facts regarding the anthracite and coke industries, the Bureau of Mines provided currently an over-all picture which enabled war agencies to keep abreast of economic and technical developments in the solid fuels field, to control prices, and to manage efficiently the distribution of supplies to war plants and civilian users. Information was provided the War and Navy Departments on international fuel, power resources, and production.

Surveys covering the consumption of foundry coke, classification of contract tonnages of merchant byproduct-coke plants, production of coke and byproducts at coal-gas retort plants, and sources of coking coal for byproduct and beehive plants were completed at the request of the Solid Fuels Administration for War and the Bureau began a study of the distribution of Pennsylvania anthracite at the retail dealer level for the 1942-43 coal year. Confidential industry surveys for coke, coke byproducts, and Pennsylvania anthracite were compiled monthly. Annual reviews covering developments in the byproduct and beehive coke, Pennsylvania anthracite, lignite, peat, fuel briquets and packaged-fuel industries were prepared for the Minerals Yearbook and summaries of these chapters, with confidential material deleted, were issued for general distribution.

Data on Foreign Minerals

Through arrangements with the Department of State and the Board of Economic Warfare the Bureau of Mines was given the responsi-

bility of the technical direction of mineral attachés and the publication for Government use only of economic facts regarding mining conditions in foreign countries. On recommendations of the Bureau, mineral attachés were appointed to American embassies in Cuba, Mexico, Peru, and Bolivia. Similar assignments are contemplated for Brazil, Argentina, Chile, and certain countries outside the Western Hemisphere. During the year, detailed reports were prepared by the Bureau regarding mineral resources of Peru, North Africa, and Turkey and similar information was assembled regarding British West Africa and French West Africa.

PUBLIC REPORTS

All publications not compatible with the prosecution of the war were eliminated during the fiscal year and general distribution of the Minerals Yearbook was discontinued. Economies also were effected by distributing abstracts of many reports in place of the full publication. Few press releases were distributed.

Because of the heavy demand for statistical data and other informative material regarding all phases of the mineral industries, the Bureau issued a series of confidential reports for restricted distribution among war agencies and certain producers of war minerals. Some chapters of the Minerals Yearbook—with all confidential information deleted—were released to persons and industries requesting such publications.

In all, 551 bulletins, technical papers, handbooks, Minerals Yearbook chapters, and contributions to technical journals were prepared.

The Bureau's Washington library of selected reference material was increased by 2,732 books; 247 periodicals, many on an exchange basis, were received regularly, and 24,471 publications were circulated for use outside the library. Many thousands of letters were written in response to requests from the public for information concerning the mineral industries.

The Bureau's free educational motion pictures, produced in co-operation with industry with production costs paid for by private industry, were in constant demand by the Army, the Navy, and the Office of Civilian Defense for use in war-training programs. They also were shown in South American republics, Canada, China, South Africa, and Great Britain. During 1943 the Bureau's films were shown on 95,876 occasions to audiences totaling 7,928,201 persons. Since 1922, the Bureau's films have been shown on 957,936 occasions and the audiences have totaled 103,584,650.

ADMINISTRATION

To handle more effectively the larger volume of administrative work, the Bureau reorganized its administrative branch, establishing an administrative officer and two assistants, one in charge of an Office of Business Management and the other in charge of budgetary matters. As in past years, the Bureau's activities were administered from Washington, D. C., but were carried on mainly in the field offices, laboratories, and pilot plants.

Personnel

On June 30, 1943, there were 3,851 full-time employees of the Bureau of Mines, distributed as follows:

	Dept.	Field	Total
General administration.....	191	56	247
Operating services.....	181	3,119	3,300
Economics and statistics service.....	129	175	304
Total.....	501	3,350	3,851

¹ Including field employees as follows: Hellum plants 269; Eastern Region, 519; Central Region, 386; Western Region, 962.

Property

The records as of June 30, 1943, show that the property of the Bureau had a total valuation of \$6,908,426.77, of which \$2,531,187.35 was for land, buildings, and improvements; \$1,242,280.85 for laboratory equipment; \$901,597.44 for machinery and power-plant equipment; and the remainder for certain helium properties, office furniture, automobiles, and other goods. The property of former Albany College, at Albany, Oreg., was purchased, under congressional authorization, for the establishment of a Northwest Electrodevelopment Laboratory.

Finance

The total funds available to the Bureau of Mines for the fiscal year ended June 30, 1943, including direct appropriations, departmental allotments, reappropriated balances, and sums transferred from other departments for service work, were \$32,178,548.44. Of this amount \$26,034,197.82 was spent, leaving an unexpended balance of \$6,144,350.62. On the regular work of the Bureau, \$24,708,880.38 was expended. These figures are subject to revision because of unpaid obligations.

bility of the technical direction of mineral attachés and the
tion for Government use only of economic facts regarding
conditions in foreign countries. On recommendations of the
mineral attachés were appointed to American embassies in
Mexico, Peru, and Bolivia. Similar assignments are contin-
for Brazil, Argentina, Chile, and certain countries outside the
Hemisphere. During the year, detailed reports were prepared

Table 1 presents classified information regarding the financial history of the Bureau for the fiscal years ended June 30, 1941-44.

Table 2 gives a statement of the distribution of congressional appropriations to the branches and divisions and the expenditure of these funds in 1943 by Bureau divisions.

TABLE 1.—Bureau of Mines appropriations and expenditures, fiscal years ended June 30, 1941-44

Fiscal year	Appropriated to Bureau of Mines	Departmental allotments ¹	Funds transferred from other departments ²	Total funds available for expenditure	Unexpended balances	Total expenditures	Expenditures, exclusive of service items ³
1941.....	\$3,944,400.95	\$91,790.00	\$2,225,939.10	\$6,262,130.05	\$1,069,298.98	\$5,192,831.07	\$4,934,951.05
1942.....	8,910,388.68	97,490.00	2,223,026.41	11,230,905.09	1,821,358.28	9,409,546.81	8,749,668.24
1943.....	28,707,630.94	106,450.00	3,364,467.50	32,178,548.44	6,114,350.62	25,034,197.82	24,708,880.38
1944.....	20,693,252.56	89,500.00	2,740,770.00	23,523,522.56	-----	-----	-----

¹ Includes printing and binding, stationery, and contingent funds.

² Includes proceeds from sales of residue gas.

³ Service items include Government fuel yards, helium, and other investigations and services for other departments.

⁴ Includes \$6,539.10 unexpended balance reappropriated, and balance of \$85,452.95 receipts from sale of helium and other products.

⁵ Includes \$914,718.39 unexpended balance reappropriated, and balance of \$79,002.28 receipts from sale of helium and other products.

⁶ Includes \$372,486.29 unexpended balance reappropriated, and balance of \$128,918.51 receipts from sale of helium and other products.

⁷ Includes \$4,523,377.56 unexpended balance reappropriated, and balance of \$202,723.66 receipts from sale of helium and other products.

TABLE 2.—Bureau of Mines expenditures, fiscal year 1943

Branch or division	General expenses	Operating rescue cars and stations and investigation of accidents	Coal-mine inspections and investigations	Testing fuel	Experiments for synthesis of motor fuel, Pittsburgh, Pa.	Mineral mining investigations	Oil and gas investigations	Expenses mining experiment stations	Care, etc., buildings and grounds, Pittsburgh, Pa. Geological Survey

W. E. WRATHER, Director

SUCCESSFUL conduct of the war is today the first duty of this Nation. American soil must be guarded against further conflict, and victory on foreign shores must and will be won.

For these purposes, our armed forces must have a ceaseless supply of weapons, munitions, and fighting and transport vehicles—a supply that can be kept up only by adequate sources and production of many metals and minerals. Furthermore, they must have ample supplies of water for all plants that are making war implements or furnishing power for their production, for military and naval installations, and for troops at the front. Finally, military leaders must have accurate maps and other information about the lands in which fighting is or will be in progress.

The Geological Survey is devoting its every effort toward meeting those imperative needs. Its trained personnel, its techniques, and its 60-year store of information are directed intensively to war problems. By investigating and reporting on ore deposits in this country and Latin America it contributes largely to an adequate supply of minerals for war purposes. By many special studies, supplementing its accumulated information on the surface and underground water resources of this country, it is rendering to the armed forces and to war industries thousands of helpful reports on available water supplies. It is preparing maps of great areas of strategic importance in this country and abroad and is making for the armed forces many special reports on foreign lands—their terrain, water supplies, building materials, and other features affecting military operations. During the fiscal year ended June 30, 1943, with augmented funds and personnel, all these tasks were carried forward with intensified vigor; the work accomplished is set forth in detail in the pages that follow.

Despite its concentration on wartime tasks, the Geological Survey has not lost sight of the fact that the results being obtained will be

invaluable also for many peacetime uses. Great tasks lie ahead. Under the dire necessities of war and the will to win, this Nation is pouring out its wealth of manpower and resources without stint or hesitation. When victory is won and this country must undertake its share in rebuilding a war-torn world, it will face problems no less grave and baffling than those of armed struggle. It will face them shorn of much of its choicer mineral resources and must thereafter increasingly rely on inferior grades or on foreign supplies. To meet those aspects of the problem, the Nation must call upon the zeal and inspiration of its scientists, its engineers, and its technologists. The Geological Survey must do its part in those future tasks; and it is looking forward and planning ways in which that part can best be accomplished.

GEOLOGIC BRANCH

The rapidly expanding scale of war production has created an almost insatiable demand for mineral commodities, and this demand has increased until not only those materials hitherto classified as of strategic and critical importance are included but also a great number of other minerals and metals that either have been considered adequate in amount or in the past have been in relatively slight demand. The shortage of shipping tonnage caused attention to be focused more sharply than ever on domestic sources of these materials and on sources in the other American Republics. The Geologic Branch, with its experienced professional staff, was especially qualified to evaluate these sources and directed its activities almost exclusively to that task. Cooperation was carried on with several States and with Federal organizations, many of which transferred funds to the Survey for the undertaking of particular tasks. The Geologic Branch was thus placed fully on a war footing, acting as a fact-finding organization and as an adviser on mineral-production policies and on reserve problems. More than 700 reports on field examination of mineral deposits were made to the various Federal agencies, many of them at the direct request of those agencies.

WAR MINERALS

As the civilian economy of the country became more restricted during the year and a greater proportion of industry was converted to war work, practically all metals and minerals became war materials, and increased quantities of most of them were demanded. In order to coordinate the work of the Survey with that of the Bureau of Mines, regional offices were established in Salt Lake City, Utah, Spokane,

Wash., Rolla, Mo., and College Park, Md. Recommendations were made to the Bureau of Mines for exploration of many deposits, and necessary geologic information was provided for most of the projects actually undertaken by the Bureau. Although confidential reports for use by the war agencies and the Bureau of Mines constituted the bulk of the Survey's output during the year, 24 Strategic Minerals bulletins and 55 press memoranda were published making detailed mine maps available to interested operators.

Detailed records of the history, geology, mineralogy, reserves, and economic possibilities of essentially all known manganese deposits, mines, and prospects in the United States were completed. Studies of manganese were completed in California, eastern Tennessee, and the Batesville district, Arkansas, but were continued in active areas in 18 other States.

Studies of copper, lead, and zinc deposits were greatly expanded during the year. Attention was given both to minor districts that offered possibilities of increased production and to larger productive districts.

More than 100 chromite deposits in California, Montana, Oregon, and Georgia were studied, most of them in cooperation with Bureau of Mines exploratory programs. These studies were important factors in demonstrating the presence of sufficient reserves to justify the erection of mills that are now producing 90 percent or more of the domestic chrome.

More than 100 separate tungsten areas, including more than twice that number of individual deposits, were examined. This work was distributed over all of the Western States. Detailed studies and reviews were made of a number of the more promising districts.

Work was continued on domestic mercury deposits, and by the end of the year most of the important producing areas had been mapped in detail. These studies have already resulted in the discovery of new ore reserves, notably at New Idria, Calif., and they have yielded a working basis for exploration and development elsewhere.

Vanadium investigations were continued, particular attention being paid to the Colorado Plateau and Idaho-Wyoming deposits. Substantial progress was made in the estimation of ore reserves, and specific drilling programs in geologically favorable areas were initiated in cooperation with the Bureau of Mines and the war agencies.

A special survey of possible new sources of molybdenum, nickel, and cobalt was undertaken. Altogether, 40 or more deposits of these metals received some attention in all the Western States, as well as in Wisconsin, New Hampshire, North Carolina, Arkansas, and Maine.

During the year the domestic situation with regard to antimony, bismuth, and arsenic was reviewed, and special studies and examinations were carried out or begun on deposits of these metals.

The search for raw materials from which aluminum and magnesium may be extracted continued during the year. Alunite, magnesite, and dolomite deposits in the Western States, bauxite and high-alumina clays in both the West and East were examined and reserves were estimated. Deposits of talc, graphite, and strontium ores were studied.

General and detailed examinations of pegmatite deposits containing sheet mica, feldspar, beryllium, tantalum, and lithium were made in Maine, New Hampshire, Massachusetts, Connecticut, Virginia, North Carolina, Georgia, Alabama, South Dakota, Colorado, New Mexico, Arizona, Nevada, California, Idaho, and Washington. The pegmatite deposits of New England and the southern Black Hills were studied with a view toward composite mining of the pegmatite minerals.

Quartz crystals have been used for many years in radio communication, but until recently the quantity needed was only a few tons a year, for which the United States was chiefly dependent upon imports from Brazil. In view of the greatly increased demand for radio equipment to meet war requirements, the Geological Survey has undertaken a search for domestic deposits of quartz of oscillator quality in various parts of the country, particularly in Arkansas and in the Southeastern and Western States. Results to date indicate that a modest supply of quartz of fine quality can be developed in Arkansas.

To meet the growing needs of the steel industry, work was focused on projects of special interest to war agencies to help relieve the critical situation in iron-ore supplies, particular attention being paid to finding readily accessible reserves of direct-shipping lump ores of low phosphorus content. Examinations were made of deposits in 22 States throughout the country.

Bauxite districts in Arkansas, Tennessee, Mississippi, Alabama, and Georgia were mapped in detail. Many new deposits were discovered, and recommendations were made by the Geological Survey to the Bureau of Mines for the drilling of selected areas. In the Appalachian region no large deposits of commercial grade were found. In the Gulf Coastal Plain drilling was begun on four projects which, by the end of year, showed about 900,000 tons of new commercial ore. In Arkansas 20 areas were drilled, and it is estimated that at least $3\frac{1}{2}$ million tons of commercial ore has been found in addition to the previously known reserves. Although the current expanded program of exploration and mining is meeting the present demand, it should be

borne in mind that the Nation's reserves of metallurgical bauxite will be exhausted within a few years if the present rate of production is maintained. The Geological Survey is therefore continuing its investigations of high-alumina clays in the hope that a satisfactory process for extracting alumina from them will be perfected. The Survey is also extending its search for bauxite into the West Indies in cooperation with the State Department.

Because of the increased need for fluorspar in the steel, aluminum, and chemical industries, the Geological Survey renewed the search for domestic deposits. Detailed geologic mapping was completed in many localities, and recommendations for drilling and other exploratory work were made to the Bureau of Mines and to owners or lessees of properties. Additional fluorspar reserves have been found in the Kentucky-Illinois field and in Colorado, New Mexico, Utah, and other Western States. The results of a more extensive program of investigation carried on in cooperation with various States, particularly Illinois, Texas, and Idaho, are being made available through the Geological Survey to the several war agencies.

Geologic studies of mineral fuels included the search for additional deposits of coking coal suitable for western steel plants and studies of areas that give promise of promptly yielding additional supplies of oil. At the request of the Petroleum Administrator for War, the oil and gas map of the United States was revised. A survey in cooperation with the Bureau of Mines provided information on additional resources of helium.

Close cooperation was maintained with several States, with the Geological Society of America, the Association of Petroleum Geologists, and the National Research Council on matters of fundamental research that would prove useful to the war program.

The Sections of Chemistry and Physics, Petrology, and Paleontology and Stratigraphy were mainly occupied in analyzing and classifying materials sent in by the field geologists. The chemical laboratory, in addition to identifying or analyzing more than 8,000 samples, developed new methods of analysis for a large number of elements, many of which occur only as minor constituents of the samples. The Section of Petrology gave special study to beryllium, tantalum, magnesium, tin, titanium, chromium, and other ores and minerals.

MILITARY GEOLOGY

During the year the Military Geology unit was established to meet the increasing demands of the War and Navy Departments for geologic information on strategic foreign areas as related to engineering.

The work was based primarily on bibliographic research, though supplemental sources of information were made available by the agency requesting information. At the close of the year, the Military Geology unit had 30 geologists and operated in part on funds transferred from the Corps of Engineers through an interdepartmental agreement and in part on funds allotted from the appropriation for "Geologic Surveys."

AMERICAN REPUBLICS

The work of the Geological Survey in the American Republics during the fiscal year, largely sponsored by the Department of State, was integrated still more closely to war needs. Although the original purpose of promoting cordial relationships between the countries continued to be of first importance, the widening effects of the war upon all nations increased the interest in war resources. Close cooperation was begun between the Board of Economic Warfare and the Geological Survey in work financed by the Board in Colombia, Central America, and Brazil. Work was carried on in Brazil on nickel and mica; in Argentina on tungsten, beryl, and tantalum; in Colombia on quartz, mica, molybdenum, copper, and mercury; in Panama on manganese; in Central America on a large variety of minerals; in Cuba on manganese, chromite, copper, and zinc; in Venezuela on mica, quartz, and nickel; and in Mexico on tungsten, manganese, antimony, fluorspar, mercury, and molybdenum.

Exploration for tungsten in Mexico has already resulted in the discovery of a district that may become an active and significant producer, and an exploration for mercury in Mexico has resulted in a large increase of production in the largest producing district. Considerable reserves of chromite have been discovered in Cuba. Aluminum ores in a novel environment have recently been discovered in the Caribbean area, and a reconnaissance of that region is being vigorously prosecuted in the hope of finding other deposits of similar magnitude and grade.

ALASKAN BRANCH

The work of the Alaskan Branch during the past year has necessarily been focused on problems whose solution would contribute most directly to the Nation's supply of war materials. Obviously this aim must be stressed so long as the war lasts, if Alaska is to make its fullest contribution to the country's war needs. Although the particular emphasis to be placed on certain phases of this work may be somewhat altered after victory has been attained, this country must be

alert to prepare so that whether at peace or at war the search for Alaska deposits of the essential mineral commodities shall be carried on intensively.

The development of Alaska is becoming tied in with increasing intimacy to the welfare of the Nation as a whole. Never again can Alaska be left as a vulnerable outpost. To avoid such danger, as well as to derive benefit from this outlying possession, the country must become more thoroughly acquainted with Alaska, its resources must be inventoried and plans must be made to utilize and develop them wisely. Into such a broad forward-looking program the present war projects fit perfectly as an integral part. The current projects are designed to supply certain mineral materials quickly, without regard to the normal requirement of commercial profit. Ultimately the present limited list must be expanded to include all the essential mineral products needed for the support of the military and civilian population in the Territory or that are needed by the Nation as a whole. Scores of mineral commodities now supplied to Alaska only through imports must be developed locally. It is absurd, for instance, for Alaska to depend on securing supplies of cement for use in local construction from points thousands of miles distant when, presumably, equally satisfactory material may be developed much nearer at hand. Coal is another mineral resource that should be developed to supply at least all of Alaska's local needs.

Still more pressing is the need for testing the places in Alaska at which signs of petroleum are known, as waning supplies elsewhere indicate plainly that the known resources of this fuel cannot long withstand the present draft by civilian and military establishments. New reserves of oil must be found and made available—tasks that cannot be accomplished quickly or cheaply, especially in a remote region like Alaska. Scores of other commodities furnish equally impressive examples to prove that delay in finding out about all of our Alaskan mineral resources is unwise and harmful to the national interest. If essential supplies are to be available when needed it is urgent that these investigations be started at once and followed up with increasing diligence and intensity.

The maps now being prepared by the Alaskan Branch mainly for special military use are even more essential for civilian use in solving the countless problems that arise in the development of a pioneer country. Practically the first step in the consideration of any construction project is the close examination of all of the data afforded by adequate topographic maps, such as the Survey has been making in Alaska for the past 45 years. From these maps may be determined the accessibility of a project from nearby or remote settlements and

its general surroundings—streams and water features that may be advantageous or sources of danger, features of relief that may be utilized or may present obstacles to be overcome.

One of the most obvious uses of topographic maps is in planning and laying out a wisely chosen network of routes for travel by air, land, and water—matters that are becoming of prime importance in all military and civilian enterprises. Selection of the sites for reservoirs, ditches, or other means for supplying water to manufacturing centers or settlements requires intensive study of the natural topographic features of the areas to be served, and at least in the initial stages can be best done with the aid of accurate maps. At present less than half of the Territory has been surveyed with the degree of accuracy required for even the most general purposes, and less than one percent has been surveyed with the degree of detail that is considered essential for areas of only moderate development in the United States proper. This condition presents a real challenge to those charged with planning for the future.

The period of readjustment that necessarily ensues between the cessation of hostilities and the Nation's resumption of a peacetime footing is always difficult to bridge unless plans have been made in advance. Even then it is not easy usually to forecast the new trends that such reorganization may take. Little such uncertainty, however, dims the outlook for Alaska. It is a vast domain covering nearly 600,000 square miles—a fifth the size of the United States proper. Its population, aside from the military forces, is only about 70,000. As yet less than 5 percent of the land is privately owned. Under such conditions it seems elementary that the Government, as landlord, should quickly ascertain what it possesses, so that it may wisely administer its holdings for the benefit of all. Such a program would have especial merit if the Government found it necessary to provide employment for idle manpower during the period when peacetime activities are being resumed, as through it the services of many could be directed into useful channels.

Indicative of what the Survey has been doing to supply some of the hitherto lacking information regarding Alaska is the following résumé of the projects in which it recently has been engaged.

During the field season of 1942, which included the latter part of the fiscal year 1942 and the early part of the fiscal year 1943, the Alaskan Branch, through its regularly appropriated funds and a generous grant from the War Production Board, carried on 37 projects concerned with the examination of mineral localities, 2 topographic projects, and 1 general administrative project. Of the mineral investigations 6 were concerned with deposits of antimony ores,

5 with iron, 4 each with chromium, mercury, nickel-copper, and tin, 3 each with copper and molybdenum, 2 with tungsten, and 1 each with zinc and barium. The geographic distribution of these various specific projects by regions was as follows: 16 in southeastern Alaska, 5 in the Prince William Sound-Copper River region, 9 in the Cook Inlet-Alaska Railroad region, 3 in the Kuskokwim region, and 4 in the western Yukon-Seward Peninsula region. The 2 topographic projects that involved field work by the staff were reconnaissance surveys. One of these was the mapping of parts of the area adjacent to the Alaska Railroad west of Talkeetna and east of Seward, and the other was the mapping of parts of the western Yukon Valley that heretofore had not been adequately surveyed.

Although not involving field work by members of the Alaskan Branch, the compilation of aeronautical piloting maps from photographs furnished by the Army Air Forces and largely paid for from funds transferred by them to the Geological Survey became the principal office activity of the Branch, not only during the season of 1942 but throughout the fiscal year 1943 and is being continued at an accelerated rate with a greatly increased force. At the present time the services of more than 250 persons are being utilized in different steps of this project.

Another office task carried on uninterruptedly both in the season of 1942 and throughout the fiscal year 1943 is the collection of statistics regarding the output of all mineral products from Alaskan deposits. In this work a canvass of all the mining operators in the Territory is utilized as well as the services of the field force to contribute current information of value.

During the season of 1943, with the funds directly appropriated to the Geological Survey, as well as with those supplied by the War Production Board that were available up to June 30, 1943, the Branch had under way 6 general supervisory projects and 22 specific projects involving the search for needed war minerals. The 6 supervisory assignments, in addition to the task of maintaining administrative oversight of the various specific projects in the 5 principal Alaska mining regions, are designed to provide for keeping track of all mineral developments in each of the regions, so as to record current conditions and aid in preparing plans for any subsequent investigations that are required. Of the specific mineral projects, 6 are concerned primarily with ore deposits containing mercury, 4 with those containing copper, 3 with chromium or nickel, 2 each with tin, zinc, and tungsten, and 1 each with molybdenum, iron, and coal. The geographic distribution of these projects by regions is as follows: 5 in southeastern Alaska, 4 in the Prince William Sound-Copper River region, 4 in the Cook

Inlet-Alaska Railroad region, 5 in the Kuskokwim region and adjacent parts of southwestern Alaska, and 4 in the western Yukon-Seward Peninsula region. A technical and professional staff of approximately 40 geologists is employed for the field and office work involved in these different projects. During the field season more than a score of temporary helpers, such as cooks, packers, boatmen, or camp hands are hired to assist in the nontechnical but nevertheless essential phases of the work. To help in the office duties involved in maintaining the necessary records, typing reports, and handling correspondence, a staff of 7 clerks is employed.

During the fiscal year 1943, 6 reports with maps, 2 reports without maps, and 6 press releases have been published; 37 brief résumés on strategic and critical minerals investigations have been transmitted to war agencies; 7 reports containing maps and 1 map are in process of publication; 10 reports are in course of preparation; 7 résumés on strategic and critical minerals investigations are in course of preparation for submission to war agencies; and 4 reports prepared by the personnel of the Alaskan Branch were approved for outside publication.

TOPOGRAPHIC BRANCH

The headquarters offices of the Topographic Branch and its Atlantic Division are located in Washington, D. C.; the headquarters office of the Central Division is in Rolla, Mo.; and that of the Pacific Division is in Sacramento, Calif. Section offices are maintained in Chattanooga, Tenn., and Clarendon, Va.

GENERAL OFFICE WORK

The bulk of the work of the Topographic Branch consisted in carrying out a War Department program of mapping and producing maps of strategic areas. Necessary office work incidental to the field work was the computation and adjustment of the results of control surveys and the inking and editing of topographic maps prior to their submission for reproduction.

Section of Computing.—An unprecedented amount of transit traverse was done during the year in order to establish control for the many new strategic areas assigned by the War Department to the Geological Survey for topographic mapping. Of the total activity of the section the computing of the results of such surveys increased from the normal 12 percent to a little more than 50 percent.

Check computations for geographic positions were completed for 244 astronomic stations where prismatic astrolabe observations had been made by the Army Air Corps.

Bulletins 930-A, 930-B, and 930-C, which are three of the four parts of "Spirit leveling in Illinois," were published during the year. Manuscript for the fourth part, Bulletin 930-D, was prepared and transmitted for publication. Results of leveling, traverse, and triangulation for various quadrangle areas were issued in 176 lithographed lists.

Computation and adjustments for routine field projects were continued, and the usual volume of control data was assembled and transmitted to comply with requests from field engineers and correspondents.

Section of Photomapping.—Work in this section is performed in Washington and in field offices located in Clarendon, Va., and Chattanooga, Tenn. Photomapping is also carried on in Rolla, Mo., and in Sacramento, Calif., under the immediate direction of the division engineers in charge. The work consists of the production of topographic maps from aerial photographs by stereophotogrammetric methods; production of planimetric maps and planimetric bases for topographic field surveys by both stereophotogrammetric and graphic methods; preparation of designs, specifications, and contracts for photogrammetric equipment; preparation of requisitions and specifications for contracts for aerial photography; and purchase of photographs from other agencies.

By stereophotogrammetric and graphic methods topographic maps covering an area of approximately 5,750 square miles and planimetric maps and bases covering an area of approximately 14,250 square miles have been produced during the year. This does not include the work performed in the Chattanooga office, which is engaged on a cooperative project with the Tennessee Valley Authority and the United States Army. Twenty-four of the Geological Survey personnel are detailed to that office.

The Washington office maintains a general file of aerial photographs utilized in the work of the Geological Survey and of negatives of aerial photographs that have been purchased under contracts for photography negotiated by the Geological Survey since 1938. Through this office contacts have been maintained with other governmental agencies involved in aerial photographic work.

The principal office of the Section of Photomapping is in Clarendon, Va. In that office, in addition to the large production facilities which are being operated on a two-shift basis, there are also maintained a central laboratory for designing, testing, repairing, and adjusting all types of special optical and mechanical equipment utilized for stereophotogrammetric work, and a photographic laboratory spe-

cializing on research and precision photography required for all the field offices of the section.

Section of Cartography.—The Topographic Branch has cooperated with the Army Air Forces in preparing aeronautical charts, the work on which was executed in the Section of Cartography. Cooperation was also continued with the Public Roads Administration in preparing for publication and in proofreading 68 sheets of the Transportation Map of the United States, and 26 sheets are now in progress.

Work on the International Map of the World on the scale of 1:1,000,000 was continued. Sheet J-18, Chesapeake Bay, was published during the year, sheet K-16 is in course of publication, and sheets I-18, K-10, K-17, and L-10 are in progress.

Numerous miscellaneous jobs were done for other Government agencies.

Section of Inspection and Editing.—During the year 13 planimetric maps were prepared for photolithography; 240 new topographic maps were edited for publication, 160 of which were for multicolor photolithography and 80 for engraving; 573 quadrangle maps, 4 State maps, and 3 State index maps were prepared and edited for reprint editions; 29 maps were edited to furnish prints for reproduction by outside contractors; and editing was completed on 178 maps prepared as illustrations for reports. Four hundred and seventy-one proofs of all kinds were read. On June 30, maps in process of reproduction included 117 for engraving and 77 for multicolor photolithography; maps being edited or awaiting editing included 58 maps for engraving and 115 for multicolor photolithography. In Clarendon, Va., a drafting force was maintained for the drafting of maps for the Atlantic Division.

MAP INFORMATION OFFICE

The Map Information Office continued its work as clearing agency for data pertaining to maps and aerial photographs of both Federal and commercial agencies. This office maintains extensive card-index and map files and is equipped to furnish data to Federal and State institutions and to an interested public. The war activity has greatly increased the work of this office.

FIELD SURVEYS

Topographic mapping was carried on in 30 States, the District of Columbia, and Puerto Rico. Cooperative projects were conducted in 17 of these States, in Puerto Rico, and with the Tennessee Valley Authority.

The mapping of 79 15-minute quadrangles and 149 7½-minute quadrangles was completed; mapping was in progress on 56 15-minute quadrangles and 115 7½-minute quadrangles; and work on 285 quadrangles is progressing in some one of the steps prior to actual mapping. Of the 228 quadrangles mapped and the 456 which are in progress, 582 are within the strategic area designated by the War Department. Of the 241 maps published, 160 are within this area.

Surveys for four special areas for the geologic investigation of strategic and critical minerals were completed, and work was in progress on five similar areas. The survey of the Olympic National Park in the State of Washington was begun, and the resurvey of Washington, D. C., and vicinity was completed.

Of the total area of the United States, 47.1 percent has now been covered by adequate topographic maps produced by the Geological Survey. As the economic use of maps increased, a demand for more detailed maps arose, and, consequently, 196,832 square miles, or 6½ percent of the entire area of the country has been remapped.

¹ Planimetric maps, not included in total surveys, were compiled from aerial photographs with field examination—Georgia, 525; Kansas, 119; and Wisconsin, 974 square miles.

² Contour interval in meters.

WATER RESOURCES BRANCH

Water enters in countless ways into man's activities; in all it is important, in some it is controlling. In time of floods, however, it is a source of damage to property and danger to life. Reliable information on water is therefore necessary for the effective adaptation of man's activities to its availability.

The Geological Survey is the Federal agency authorized to collect and publish essential facts about the quantity, chemical quality, availability, and best methods of utilizing the water resources of the Nation. Its reports constitute a great reservoir of reliable information with respect to those resources. They are used by planners in organizing projects; by engineers in evaluating projects and in designing and

ling structures; by operators of water-supply, irrigation, power, other water-using systems; by bankers in financing developments in protecting the integrity of stocks and bonds and the security investments; by lawyers in litigating rights and damages; and by ts in arriving at equities. The information contained in the ey's water reports is, therefore, intimately related to the lives, ities, and security of the general public.

funds aggregating more than \$3,000,000 were available for water-urces investigations during the fiscal year 1943. Of that amount at 43 percent was appropriated by Congress, about 33 percent was istributed by States and municipalities, and about 24 percent was sferred or reimbursed by other Federal agencies.

COOPERATION WITH STATES AND MUNICIPALITIES

he appropriation by Congress for studies of water during the fiscal e 1943 was \$1,298,800. Of that appropriation \$975,000 was irected for use in cooperation with States and municipalities, but cooperating agencies contributed considerably more than that ount and sufficient additional Federal funds were supplied from unrestricted part of the appropriation to meet the excess offerings. e amounts contributed by States and municipalities are summar- l below:

ACTIVITIES CARRIED ON FOR OTHER FEDERAL AGENCIES

Other Federal agencies provided nearly \$700,000 for water resources estigations that could not be financed by appropriated funds of e Geological Survey or included in cooperative programs. These encies are the Office of the Chief of Engineers, Mississippi River ommission, and Office of the Quartermaster General, War Depart-

ment; Bureau of Yards and Docks, Navy Department; Tennessee Valley Authority; Flood Control Coordinating Committee, Department of Agriculture; Weather Bureau, Department of Commerce; Bureau of Reclamation, Fish and Wildlife Service, National Park Service, Bureau of Mines, Office of Indian Affairs, Office of Land Utilization, and Bonneville Power Administration, Department of the Interior; Department of State; Federal Power Commission; and Federal Works Agency.

WAR SERVICE

Important as are the Survey activities with respect to water in peacetime, they are even more important in war. Authoritative information on the quantity and quality of available water has been sought during the initial period of planning and construction and is still being sought in connection with the selection of sites for military establishments, the erection of new industrial plants and enlargement of old plants engaged on war contracts, and the operation of all. In addition to the broad general use that has been made of the published reports, the Survey has made during the year more than 4,000 special war reports related to water, about 1,600 in the first 6 months and about 2,400 in the second 6 months. These reports were made to the War and Navy Departments, the War Production Board, industrialists and engineers employed on war contracts, and other miscellaneous Federal, State, municipal, and industrial agencies. They have related to water for cantonments, naval stations, military hospitals, training fields, air fields, munitions industries, manufacturing plants, hydraulic and steam power plants, emergency housing, increased municipal supplies, irrigation expansions for increasing the production of foods, inland-waterway navigation, flood protection, supplemental supplies during droughts, and emergency supplies provided to supplement regular supplies if those should be damaged by bombings. The reports have been concerned with the quantity, chemical quality, and availability of both surface water and ground water. They were based in part on information collected in previous years and in part on the results of special investigations made in regions where information was meager, or where possible deficiencies in quantity or doubtful quality of water appeared to be most threatening, where heavy pumping for war purposes had caused local depletions of ground water, or where there appeared to be danger of salt-water encroachment. They have been made in every State and in the Territories of Alaska and Hawaii, but have been of greatest intensity in the industrial regions of the East, South, and far West.

The speed and effectiveness of this special war service have been greatly promoted by the wide distribution over the country of the Survey's professional personnel, with headquarters in nearly 100 field offices. It has thus been possible in any region to make easily and quickly available the services of specialists on water who are well informed on local conditions and problems. The war services have been promoted also by the cooperation with States and municipalities, whose officials have made freely available the services of their personnel and the information contained in their files and in their published and unpublished records. This pooling of Federal and local resources and efforts has demonstrated to an extent not previously recognized the value of the programs of cooperation in time of National emergency.

CONTINUING ACTIVITIES RELATED TO BOTH WAR AND PEACE

The operations of the Geological Survey that are related to water are conducted by five administrative divisions—surface water, ground water, quality of water, utilization of water, and power resources. Because of the wide variations in quantity and quality of water, continuity of records is essential both for the emergency problems of war and for the recurring problems of peace; it is necessary, therefore, that at least as much of the ordinary activities of the Survey as will suffice to maintain continuity of records shall be carried on, even when the major efforts relate to war problems.

Records of the stage, quantity, or availability of surface waters are collected at about 5,000 gaging stations distributed through every State and the Territory of Hawaii, the number of stations depending upon the funds made available by cooperation with States and municipalities and by transfers from other Federal agencies. The field records are analyzed and released to the public and to the cooperating agencies as promptly as practicable. They are the basis for constructing, operating, and administering municipal and industrial water supplies, irrigation systems, power plants, flood-control works, inland waterways, and similar activities. Cooperation in surface-water studies is effective with about 150 State and municipal agencies, the personnel operating from 45 field offices.

The studies of ground water relate to the waters that lie in the zone of saturation, from which wells and springs are supplied. They cover the source, occurrence, quantity, and head of these waters; their conservation and artificial replenishment; their availability and adequacy for domestic, industrial, irrigation, and public supplies, and as watering places for livestock and desert travelers; and the methods of

ment; Bureau of Yards and Docks, Navy Department; Tennessee Valley Authority; Flood Control Coordinating Committee, Department of Agriculture; Weather Bureau, Department of Commerce; Bureau of Reclamation, Fish and Wildlife Service, National Park Service, Bureau of Mines, Office of Indian Affairs, Office of Land Utilization, and Bonneville Power Administration, Department of the Interior; Department of State; Federal Power Commission; and Federal Works Agency.

WAR SERVICE

Important as are the Survey activities with respect to water in peacetime, they are even more important in war. Authoritative information on the quantity and quality of available water has been sought during the initial period of planning and construction and is still being sought in connection with the selection of sites for military establishments, the erection of new industrial plants and enlargement of old plants engaged on war contracts, and the operation of all. In addition to the broad general use that has been made of the published reports, the Survey has made during the year more than 4,000 special war reports related to water, about 1,600 in the first 6 months and about 2,400 in the second 6 months. They have related to water for cantonments, naval stations, military hospitals, training fields, air fields, munitions industries, manufacturing plants, hydraulic and steam power plants, emergency housing, increased municipal supplies, irrigation expansions for increasing the production of foods, inland-waterway navigation, flood protection, supplemental supplies during droughts, and emergency supplies provided to supplement regular supplies if those should be damaged by bombings. The reports have been concerned with the quantity, chemical quality, and availability of both surface water and ground water. They were based in part on information collected in previous years and in part on the results of special investigations made in regions where information was meager, or where possible deficiencies in quantity or doubtful quality of water appeared to be most threatening, where heavy pumping for war purposes had caused local depletions of ground water, or where there appeared to be danger of salt-water encroachment. They have been made in every State and in the Territories of Alaska and Hawaii, but have been of greatest intensity in the industrial regions of the East, South, and far West.

The speed and effectiveness of this special war service have been greatly promoted by the wide distribution over the country of the Survey's professional personnel, with headquarters in nearly 100 field offices. It has thus been possible in any region to make easily and quickly available the services of specialists on water who are well informed on local conditions and problems. The war services have been promoted also by the cooperation with States and municipalities, whose officials have made freely available the services of their personnel and the information contained in their files and in their published and unpublished records. This pooling of Federal and local resources and efforts has demonstrated to an extent not previously recognized the value of the programs of cooperation in time of National emergency.

CONTINUING ACTIVITIES RELATED TO BOTH WAR AND PEACE

The operations of the Geological Survey that are related to water are conducted by five administrative divisions—surface water, ground water, quality of water, utilization of water, and power resources. Because of the wide variations in quantity and quality of water, continuity of records is essential both for the emergency problems of war and for the recurring problems of peace; it is necessary, therefore, that at least as much of the ordinary activities of the Survey as will suffice to maintain continuity of records shall be carried on, even when the major efforts relate to war problems.

Records of the stage, quantity, or availability of surface waters are collected at about 5,000 gaging stations distributed through every State and the Territory of Hawaii, the number of stations depending upon the funds made available by cooperation with States and municipalities and by transfers from other Federal agencies. The field records are analyzed and released to the public and to the cooperating agencies as promptly as practicable. They are the basis for constructing, operating, and administering municipal and industrial water supplies, irrigation systems, power plants, flood-control works, inland waterways, and similar activities. Cooperation in surface-water studies is effective with about 150 State and municipal agencies, the personnel operating from 45 field offices.

The studies of ground water relate to the waters that lie in the zone of saturation, from which wells and springs are supplied. They cover the source, occurrence, quantity, and head of these waters; their conservation and artificial replenishment; their availability and adequacy for domestic, industrial, irrigation, and public supplies, and as watering places for livestock and desert travelers; and the methods of

constructing and utilizing wells and of improving springs. The increasing use of water from wells is causing a great demand for intensive studies of the quantities of ground water that are perennially available. Investigations conducted from 27 field offices were in progress during the year in nearly every State. In 34 States and in Hawaii the work was done in cooperation with 56 State and municipal agencies. Periodic measurements of water levels or artesian pressure were made in about 7,000 observation wells. Investigations were made or are in progress in most of the critical areas of heavy pumping to determine whether shortages in ground-water supplies are being caused by war demands.

Chemical analyses of 2,830 samples of water were made in the water-resources laboratory in Washington and of 5,263 samples in the division laboratories in Miami, Fla., Albuquerque, and Roswell, N. Mex., and Austin, Tex. Many of the samples were collected in connection with studies of water supplies for Army and Navy establishments and for munition plants and housing developments. Cooperative studies were continued on the chemical character of surface waters in Florida, Georgia, New Mexico, and Texas. Samples of water were analyzed for cooperative studies of ground-water conditions in other States. Interpretations of analyses or advice about water problems were furnished to 17 bureaus in 6 Federal Departments and to 10 independent agencies.

A variety of hydrologic and hydraulic studies and compilations are made on the utilization and control of streams, and a monthly summary, the Water Resources Review, is issued giving stream-flow and ground-water conditions throughout this country and Canada. These summaries are used extensively by many agencies, including major war agencies, engaged in production where floods or droughts are vital. The administration of certain responsibilities relating to permits and licenses of the Federal Power Commission has been continued. Because of the importance of power in the war program this function is increasingly essential. Investigations of water problems along the international boundary between the United States and Canada have been continued for the State Department and the International Joint Commission. Among the important problems studied have been the international aspects of storage above the Grand Coulee Dam and in Kootenai Lake, both related directly to the production of power for war.

CONSERVATION BRANCH

The principal functions of the Conservation Branch are (1) making surveys and investigations of the water and mineral resources of the

the domain and applying the results of such investigations to the needs of public-land administration and (2) supervising operations incident to the development of power and to the production of minerals, including oil, gas, coal, potash, sodium, lead, and zinc, from the lands, Indian lands, and naval petroleum reserves. During the present emergency these functions have been enhanced and extended and the proportions attained in times of peace. Exploitation and conservation of the natural resources of the United States have been and continue to be accelerated for the duration of the emergency in order to meet the war needs for critical minerals, chemicals, fuels, minerals, and water power, with a minimum dependence upon imports. The Conservation Branch, therefore, has given particular attention during 1943 to the location, availability, and extent of such resources under Federal control and has directed its energies, subsequent to December 7, 1941, toward increasing the contribution of public-land resources to the war program.

CLASSIFICATION OF LANDS

Mineral classification.—As consultant and adviser in geology to various Federal agencies, primarily those bureaus and offices in the Interior Department concerned with the administration of Federal, public, and Indian lands, the Mineral Classification Division conducted during the fiscal year its vital function of supplying geologic findings and decisions that are prerequisite to the issuance or transfer of prospecting, development, and production rights pertaining to such lands under the mineral-leasing laws; to the determination of areas for unitization agreements for oil and gas holdings and pertinent participating areas; to the utilization of Federal lands for right-of-way purposes; and to the issuance of patents to States and individuals in the final disposal of such lands under the nonmineral-land laws.

In all, 7,900 cases, each involving from one to many geologic determinations, were acted on. Additional office activity included the preparation, revision, or cancelation of definitions of the known geologic structure of four producing oil and gas fields, the total net area so defined in nine public-land States being 1,691,617 acres at the end of the fiscal year.

In aid of mineral classification, investigations were made of geologic conditions relating to coal, oil, and gas in Colorado, Montana, New Mexico, Oklahoma, South Dakota, Utah, and Wyoming and of geologic conditions at one dam site in Washington.

Water and power classification.—The work of obtaining basic information concerning the water-power resources and storage possibilities of Federal lands and of making such information available for use in the administration of the public-land laws was continued throughout the fiscal year. Office activity resulted in the addition of 21,288 acres to power-site reserves and the elimination of 1,602 acres therefrom, with net increase of the outstanding reserves in 22 States and Alaska to 6,635,432 acres; in final action involving hydraulic determinations on 170 cases received for report from departmental sources and the Federal Power Commission; and in water-power classification on 2,522 cases, which also involved mineral classification. Reservoir site reserves in 9 States remained unchanged at 137,172 acres. One final and two preliminary mimeographed reports and one manuscript report were prepared on stream utilization.

In the field, operations were on a reduced scale because of war conditions. Topographic surveys were made of 20 linear miles of stream valley and of 1 mineral leasehold, and, in cooperation with the Water Resources Branch, supervision of construction and operation was given to 163 power projects under license from the Federal Power Commission, to 179 such projects under permit and grant from the Department of the Interior, and to 151 in cooperation with the Office of Indian Affairs.

MINERAL LEASE SUPERVISION

Mine supervision.—The Mining Division is charged with the supervision of mining operations for the discovery and production of coal, potassium, sodium, phosphate, and oil shale in public lands; of sulfur in public lands in New Mexico and Louisiana; of gold, silver, and mercury in certain land grants; of all minerals except oil and gas in tribal and restricted-allotted Indian lands; and with the supervision of production on public lands by the Metals Reserve Co. under authorization of the Secretary of the Interior. It also serves as consultant to the Department of Agriculture on mining leases under the jurisdiction of that Department. The supervisory work was directed from 7 field offices in the western United States and Alaska and on June 30, 1943, covered 700 public-land properties under lease, prospecting permit, or license in 15 States and Alaska, 268 Indian properties under lease and permit in 14 States, and 3 Secretarial authorizations in 3 States, with an estimated value of production of approximately \$45,000,000.

In response to war demands for fuel, fertilizers, and strategic minerals, there has been a substantial increase in the production of coal, sodium, potassium salts, and phosphate rock from public-land proper-

work of and under supervision of the Mining Division, and accrued revenues correspondingly higher. The search for potash and associated such as cesium and aluminum was intensified. The issuance of Order 829 by the Secretary of the Interior on June 9 removed an 8-year restrictive order on the granting of potash prospecting permits and the laws, and a further increase in prospecting is anticipated during

Indian land mining activity was responsive to the same economic conditions and resulted during the year in the working of substantially higher-grade lead and zinc ores, a considerable increase in the production of coal and vanadium, and in prospecting with a view to further development of known deposits of vanadium, uranium, tungsten, and other.

Information and assistance on war-engendered problems relating to uses of coal for fuel, coke, resins, and as a supplemental source of other fuels, and of numerous metalliferous and industrial minerals in various parts of the country were provided by engineers of the division to numerous individuals contemplating development and to representatives of various State and Federal agencies.

Oil and gas supervision.—The Oil- and Gas-Leasing Division is charged with supervisory duties analogous to those of the Mining Division. They include operations for the discovery and production of petroleum, natural gas, natural gasoline, and butane occurring in public lands of the United States, in naval petroleum reserves, and in Indian lands subject to departmental jurisdiction, both tribal and non-tribal, except those of the Osage Nation in Oklahoma. During the calendar year 1943 the inspectional, regulatory, and accountancy duties of supervision were discharged through 19 field offices and suboffices in California, Colorado, Montana, New Mexico, Oklahoma, Utah, and Wyoming.

Petroleum and its derivatives are of vital importance to the successful prosecution of the war. By reason of heavy war-induced demands upon the productive capacity of known petroleum reserves in this country and an alarming reduction in the number of discoveries of new reserves, the military and certain Federal establishments have initiated prompt remedial efforts. The petroleum industry has made a timely response and has instituted a widespread prospecting and development program designed to relieve the critical situation in the shortest possible time, with due regard for the use of equally vital materials. This accelerated program has been reflected in increased activities on federally supervised oil and gas properties which currently contain about 7 percent of the known petroleum reserves in the United States and from which are extracted annually about 5 percent

of the crude oil produced in the United States. Enhanced activity and accelerated individual field studies and investigations, particularly those dealing with secondary recovery methods designed to augment the contribution of federally supervised oil resources to the war program, may reasonably be expected to produce those percentages during the ensuing few years.

On public lands the number of properties under supervision at the end of the fiscal year aggregated 4,472 and involved 2,819,211 acres in 19 States and Alaska.

Drilling on public lands during the year included the completion of 387 wells and the completion of 413 wells, of which 315 were productive of oil or gas and 98 were barren. In all, 10,532 productive wells, including 5,601 capable of oil and gas production, were under supervision on June 30, 1943. The production of natural gas and gasoline from public lands during 1943 was somewhat less than the production of crude oil was somewhat greater than during 1942.

During the year 10 new plans of unit operation involving public lands were approved and 4 were terminated, leaving 123 plans, containing 1,862,337 acres, outstanding on June 30, 1943. Production under approved unit agreements constituted about 40 percent of the petroleum, 61 percent of the natural gas, and 76 percent of the gasoline and butane obtained from public lands during the year.

On Indian lands the Oil- and Gas-Leasing Division supervised 4,221 leaseholds in 8 States, containing at the end of the year of 7,522 wells, 4,036 of which were productive of oil or gas and 3,486 of which had been completed during the year. Production from such leaseholds was somewhat greater than in the preceding year, owing principally to a substantial increase from Ootie Indian lands in Oklahoma. The discovery and development of valuable natural gas bearing natural gas on Navajo lands in New Mexico provided an outstanding contribution to the war program. Rentals, royalties, and bonuses accrued from operations on Indian land during the year are estimated to aggregate \$2,607,000.

On behalf of the Navy Department supervision was continued during 1943 over operations for the production of oil, gas, gasoline, and butane from 18 properties under lease in Naval Petroleum Reserves Nos. 1 and 2 in California and for the conservation of shut-in production in Reserve No. 3 in Wyoming. Production from 300 wells on Reserves Nos. 1 and 2 aggregated 2,269,735 barrels of oil, 1,619,390,000 cubic feet of natural gas, and 7,964,900 gallons of natural gasoline and butane, the aggregate royalty value being \$492,748.

WORK ON PUBLICATIONS

Texts.—The publications issued during the year numbered 94, including 76 reports in the regular series and 18 miscellaneous pamphlets, a total of 14,299 pages; 68 new manuscripts were received, and 65 were sent to the printer. Work on publications included the following: 12,563 pages of manuscript edited and prepared for printing; 939 galley proofs and 4,983 page proofs revised and returned; indexes prepared for 27 publications, covering 2,013 pages and consisting of 6,218 index entries. Copy prepared for mimeographing included 78 press releases, comprising 139 pages, and 165 pages of miscellaneous material.

Illustrations.—Twenty-four reports containing 320 illustrations were transmitted to the printer; of these, 9 reports with 38 maps and 8 sections were directly related to the war effort. In addition, 119 maps and 34 sections illustrating deposits of essential strategic minerals were prepared, and 263 proofs and 97 edition prints were examined.

Geologic map editing and drafting.—In order to make the results of its studies quickly available to public, the Geological Survey has from time to time prepared photostat copies of the geologic maps of areas containing minerals of war interest. These maps have been announced through press releases. Copy was edited for 23 maps to be photostated and for maps to be used in 26 printed reports of the regular series of publications.

Distribution.—The Division of Distribution received during the year a total of 858 publications, comprising 81 new books and pamphlets, 253 new or revised topographic and other maps, of which 12 maps were first published as preliminary editions, 44 Tennessee Valley Authority maps with contours, 409 reprinted topographic and other maps, 37 new advance sheets, and 34 reprinted advance sheets. The total units of all publications received numbered 149,289 books and pamphlets and 1,911,495 topographic and other maps, a grand total of 2,060,784. The division distributed 99,798 books and pamphlets, 883 geologic folios, and 910,021 maps, a grand total of 1,010,702, of which 800 folios and 805,502 maps were sold. The net proceeds (gross collections less copying fees and amounts refunded) from the sales of publications were \$16,056.72, including \$15,824.87 for topographic and geologic maps, and \$231.85 for geologic folios. In addition to this, \$38,525.91 was repaid by other establishments of the Federal Government at whose request maps or folios were furnished. The total net receipts, therefore, were \$54,582.63. The foregoing figures are exclusive of 486,965 Geological Survey maps delivered from the Division

of Engraving and Printing direct to the War Department on a repay basis.

Engraving and Printing.—During the year 253 new maps were printed and delivered. These consisted of 83 newly engraved topographic maps (including 3 revised maps), 160 multicolor topographic maps (12 of which were originally printed as preliminary editions), and 10 special maps. Reprint editions of 396 engraved topographic maps of 13 photolithographed State and other maps were printed and delivered. Of new and reprinted maps, 662 different editions, amounting to 1,835,165 copies, were delivered. A large amount of work was done for 85 other units of the Government, including branches of the Geological Survey, and the charges for it amounted to about \$190,000, for which the appropriation for engraving and printing geologic and topographic maps was reimbursed. Transfer impressions and velox prints, numbering 523, were made during the year, and the amount turned over to miscellaneous receipts was \$216.73. Topographic maps and contract and miscellaneous work of all kinds, totaling 3,156,063 copies, were printed and delivered. The photographic laboratory made 12,923 negatives, 27,912 prints, 2,810 photolith press plates, 260 intaglio etchings, and 6 celluloid transfers, and mounted 1,741 prints.

LIBRARY

The first full year of participation in the war was strongly reflected in the work of the Library. In addition to assisting the Survey, especially in its work on military geology, the Library has been serving directly the War and Navy Departments, the War Production Board, the Board of Economic Warfare, and all the agencies whose work requires source material in natural resources, geology, or engineering. A total of 13,526 readers used the Library during the fiscal year, double the number normally served. More than 75,000 pieces of material were circulated, almost double that of a normal year and 20,000 more than last year's total of nearly 56,000, itself a record. Acquisitions again were below normal. Not only have most of the foreign publications been cut off, but some American publications have been suspended or curtailed. The bibliography and index of North American geology, 1940-41, was received from the printer in April. The cumulative index, 1929-39, has been sent to the printer.

FIELD EQUIPMENT

A large number of the instruments used for war activities by the several branches of the Geological Survey are designed, constructed,

and repaired by the Division of Field Equipment. Many improvements have been made, especially in the mechanical devices used to produce trimetrogon maps from aerial photographs for the Air Corps. A new device, called an angulator, has been designed and constructed to further facilitate such work. The angulator performs functions similar to those of the rectoblique plotter but has fewer limitations in that it permits the use of photographs taken at practically any angle with the horizon by cameras having various focal lengths. The problems of administration, relief work, reconstruction, and pioneering that follow every war invariably carry with them an immediate need for dependable maps of the areas involved. Areas in interior Alaska, Canada, Russia, China, and Africa are particularly deficient in adequate maps. The mechanical devices constructed by this division for use in connection with the trimetrogon mapping method offer a rapid practicable means for reconnaissance mapping of combat and strategic areas and for making the reconnaissance maps that will be urgently needed in the early post-war period. Improvements have also been made in the design and construction of isometrographs, which are used by geologists for the semimechanical conversion of topographic maps into relief diagrams that provide pictorial representations of land surfaces. This equipment may also serve valuable purposes during the post-war period, as its use speeds the work of searching for new sources of metals, minerals, and other valuable natural resources, the present supplies of which are now being rapidly depleted.

FUNDS

During the fiscal year 1943 there was available for expenditure under the direction of the Geological Survey a total of \$11,129,028. Of this amount \$4,699,390 was appropriated directly to the Geological Survey, and \$6,429,638 was made available by other Federal agencies, and by States and their political subdivisions. In addition, \$9,104 was allotted from the appropriation for contingent expenses of the Department of the Interior for miscellaneous supplies.

Bureau of Reclamation

HARRY W. BASHORE, Acting Commissioner¹

THE spotlight of war retained a sharp focus during the fiscal year 1943 on two major fields of production—food and power. In both, the activities of the Bureau of Reclamation in the western third of the Nation played a major role.

The productive farms served by its irrigation facilities provided bountiful food crops to a hard-driving, fighting Nation. At the same time the Bureau's mighty hydroelectric generators sent an ever-growing stream of kilowatts into war production plants and projects.

In the early days of the war one of the greatest single tasks confronting the United States was to overcome Axis superiority in the production of planes, tanks, ships, and guns. Toward this objective the Bureau offered great blocks of power. The far-sighted policy which was exemplified in the construction of Boulder, Grand Coulee, and Parker Dams in time of peace to keep ahead of the inevitable growth of the West, paid immediate dividends as the Nation prepared for war. Reclamation's pre-Pearl Harbor installations were doubled by June 30, 1943. Generators rated at 900,000 kilowatts were added, most of them 2 to 10 years ahead of schedule. The potential output from the new capacity is sufficient to manufacture the aluminum to build more than 30,000 giant four-motored bombers annually.

Major attention also was directed toward measures to augment food stocks which were required to meet the increased demands of the armed forces, lend-lease countries, liberated peoples across the seas, and civilians at home.

The Bureau of Reclamation anticipated the wartime need for more food and was prepared to bring about increased food production to

¹Mr. Bashore, Assistant Commissioner of Reclamation since May 27, 1939, was appointed Commissioner by President Roosevelt and took office on August 3, 1943. William E. Warne, former Chief of Information of the Bureau, was appointed Assistant Commissioner by the Secretary of the Interior at the same time and entered on his duties on August 9. Due to ill health, John Chatfield Page, Commissioner of Reclamation since January 25, 1937, resigned his position in June.

meet an emergency as critical as the earlier need for increased hydroelectric power. From the nearly 4,000,000 acres of irrigated land served by Reclamation systems in 15 western states came large supplies of vital foods—beans, potatoes, sugar, fruits, and other commodities equally important. The output for the calendar year 1942 was valued at more than a quarter of a billion dollars, 45 percent greater than the record crop return for 1941.

For the 1943 season Reclamation farmers diverted their efforts from the less essential to the more important war crops. This "win the war" spirit resulted in record spring plantings of potatoes, beans, and alfalfa (for beef and dairy herds), the harvest of which is expected to exceed the high 1942 production total.

The Bureau's war food construction program to extend its irrigation service to nearly 2,000,000 additional acres by 1945 was given impetus toward the close of the year by congressional recommendations. The Senate and House Appropriations Committees urged the War Production Board, which controls construction, to reexamine stop-orders which that agency had issued against irrigation construction late in 1942 in order to divert critical materials to other war purposes. The objective was to obtain authorization to resume work on 19 projects and to initiate construction on others. Appropriations were made to advance the program.

The War Food Administration, which has the responsibility for food production, specifically recommended to the War Production Board that irrigation construction on eight Bureau projects, affecting about 900,000 acres, be permitted. Up to June 30 clearances had been given by the Board on projects serving 278,000 acres.

The power made available in the fiscal year from two new plants brought into operation and from additional generators at other major projects was responsible for much of the West's continued expansion in war production. With a 35 percent increase in capacity and a 100 percent gain in output, Reclamation plants supplied power to industries which produce aluminum and magnesium, airplanes, ships, ferro-alloys for tanks, explosives and manganese, and which process foods, and provide other materials vital to the prosecution of the war.

The output of Bureau power plants this fiscal year was 9½ billion kilowatt-hours. Additional installations in progress on June 30 indicate a production in the next fiscal year of 15 to 16 billion kilowatt-hours—a volume greater than was produced by all power plants in the United States in 1914.

Bureau facilities provided industrial water for war industries and municipal water for the civilian and military population of the Los

Angeles area and other western centers. This service also was an effective aid toward greater war output.

Through irrigation, power, or municipal water service, nearly all of the 52 Reclamation projects in operation facilitated war activities at such important points as Army and Navy military posts, air bases and training centers, and war production plants. Nearly 5,000,000 persons, a third of the population of the West, live in the areas which are served by the Bureau's systems.

While concentrating on war activities, the Bureau continued its investigation of the feasibility of irrigation and multiple-purpose projects which will be added to a shelf of post-war public works. The construction of these projects will provide local and regional employment and contribute to national post-war industrial activity. When completed, these projects will provide permanent settlement opportunities on irrigated land for demobilized service men and industrial workers.

The Bureau of Reclamation has as its objective the conservation of the limited water resources of the West for irrigation, power development, domestic and industrial water supply, and for other beneficial uses. Under the Reclamation Act of 1902, the Bureau's activities are confined to the 17 states west of, or bisected by, the 100th meridian. Except for a narrow strip on the Pacific coast, north of San Francisco, and in the high mountains, the rainfall in this region is inadequate, and irrigation is necessary to sustain agriculture. While coal, oil, and gas as fuel for power plants are available in some areas, the principal reliance is on hydroelectric developments for war and peacetime industries, and for military, commercial, domestic, and rural needs.

FIVE MILLION PERSONS IN AREA SERVED

Of the nearly 5 million persons who live in the areas which are served by the facilities provided by the Bureau of Reclamation in 15 western states, more than 3½ million were supplied power and domestic water, and 1,197,880 lived on the 88,050 farms which are served by the irrigation projects or in the 316 towns on or near these developments. In the irrigation areas served were 1,187 schools, 1,484 churches, and 137 banks with deposits totaling \$520,357,000 (see table 3).

At the end of the fiscal year 71 projects were in operation, under construction, or authorized. Fifty-two of this number were generating power or supplying water for irrigation or for domestic, military, or industrial use. Important features remain to be constructed on many of the projects that are in operation. Nine others are in vary-

ing stages of construction. Also authorized are nine projects on which the initiation of work was deferred at the beginning of the war. One project, authorized at the close of the fiscal year, is scheduled for early construction.

The storage capacity of 81 reservoirs in operation reached a new high of more than 64 million acre-feet, about 20,000 billion gallons. The 151-mile long lake behind Grand Coulee Dam (Columbia Basin project, Washington) reached capacity for the first time on July 12, 1942.

Cumulative crop values for the 41 years of operation have passed the 3 billion dollar mark (see table 2). The amount is more than four times the construction costs through June 30 (see table 5).

Under the Reclamation Act and amendments, and other legislation, more than 95 percent of the construction costs of projects is reimbursable. The remainder is allocated to flood control, aid to navigation, contributed labor, or will be repayable by municipalities for supplemental water supplies.

FOOD ASSUMES INCREASED SIGNIFICANCE

Long before the necessity for expanding the Nation's agricultural plant for war purposes was given the proper emphasis, the Bureau was reappraising its facilities and construction program to determine what contributions it could make toward increasing food production. The Bureau recognized that through construction of additional irrigation systems new lands could be brought into cultivation promptly and supplemental water could be provided for irrigated areas where water shortages were curtailing crop production.

The Bureau was also fully aware that because of the increased demand for food in the Far West due to war conditions it was doubly essential to expand irrigated agriculture in the arid and semiarid regions. This demand resulted from military concentrations, the growing civilian population, lend-lease requirements, and overseas shipments to the armed forces in the Western Pacific. Dependent on irrigation for 75 percent of its food and never self-sufficient in dairy products and meat, the West faced a critical situation. Added imports from the Middle West and East further taxed transportation facilities already overburdened with movements of troops and materials.

In March 1942, the Bureau proposed an accelerated program for expanding existing and developing new water supplies which called for a speed-up of work on projects under construction. It also included the initiation of new undertakings. The program would have made more water available for food production in 1943, 1944, and 1945.

Through the summer of 1942, the Bureau continued construction on 25 projects insofar as critical materials were available. The restricted construction came to a virtual standstill, except for power installations on five projects, following a sweeping stop-construction order which was issued by the War Production Board late in 1942. Subsequently limited construction of certain facilities was permitted on 12 irrigation and municipal water projects.

Alive to the increasing food requirements in the winter of 1942-43, the Bureau presented a second accelerated program under which, by 1945, the irrigated acreage it serves could be increased by 75 percent. The lands benefited were to be devoted primarily to the production of beans, potatoes, and alfalfa for livestock feed—critical war foods.

In March, the Secretary of the Interior announced a departmental food program under which the Bureau could extend irrigation service to a total of 9,000,000 acres in 5 years. Under this program, the output from irrigated land of some of the more important war crops could be doubled by 1947. The achievement of the results under these programs depended on immediate clearance for critical materials, adequate funds, and manpower. As a result of delays in obtaining these prerequisites, a revised program was outlined in June 1943 under which irrigation service could be extended to 2,000,000 additional acres by 1945. This program included resumption of construction on 19 projects on which work had been halted by stop-construction orders and initiating construction on a large number of new projects. Emphasis, as in the previous programs, was placed on those which could be begun quickly and which would require a minimum of critical materials.

Acting to get the projects approved and construction started, the Bureau presented detailed information on each to the War Food Administration which had the authority to recommend irrigation construction to the War Production Board.

At the close of the year, the War Food Administration had recommended for wartime construction eight projects proposed by the Bureau of Reclamation, as follows:

Colorado.....	Colorado-Big Thompson and Mancos. ¹
Idaho.....	Anderson Ranch Dam (Boise).
California.....	Central Valley (Friant Dam, Madera and Friant-Kern Canals).
Oregon-Calif.....	Klamath-Modoc. ¹
South Dakota.....	Rapid Valley. ¹
Utah.....	Newton. ¹
Washington.....	Yakima-Roza. ¹

¹ War Production Board approved resumption of construction on July 27, 1943.

Of these, Friant Dam and the Madera Canal of the Central Valley project had been given clearance by the War Production Board on June 30 and the remainder were under consideration. Construction to protect the Yuma (Arizona) air base from dust storms had previously been authorized on the Gila project. Clearance had also been given on Scofield Dam in Utah primarily as a flood control measure. Both projects will aid in food production.

The Bureau personnel encouraged a shift from less essential to the more important war crops. As of June 30, 1943, reports of actual and estimated plantings received from 26 projects, comprising 82 percent of the total acreage of all projects, showed a 44.5 percent increase in potato acreage, a 36.2 percent increase in bean acreage, and a 1.8 percent increase in alfalfa acreage. The production of alfalfa, fed to beef and dairy stock, means increased quantities of meat and dairy products. The 1943 cultivated acreage will be the largest ever reported for Federal Reclamation projects.

POWER FOR WAR

Keeping ahead of the unprecedented industrial expansion in the West, Reclamation power production rose from about 4¾ billion kilowatt-hours in the fiscal year 1942 to about 9½ billion in 1943, an increase of 100 percent.

The installed capacity of 30 power plants on 19 projects in 11 states is practically double the June 30, 1941 installation. The new 900,000 kilowatts made available in the 2-year period—potentially more than 7 billion kilowatt-hours—was transmitted almost entirely to busy war production centers. Translated into terms of war equipment, the added power is highly significant. It is sufficient to produce annually more than 30 huge battleships or more than 11,000 four-motored bombers.

Most of the new generators were installed far ahead of schedule. At Grand Coulee about half a million kilowatts were installed 2 to 5 years ahead of original plans. Initial schedules called for the first generator to be in service at Grand Coulee in 1943 or 1944. Instead, five giant machines are now turning. Parker Dam power plant, situated on the Colorado River below Boulder Dam and rated at more than 115,000 kilowatts, was put into operation 8 years ahead of schedule.

The gain in Reclamation power capacity during the fiscal year totaled about 480,000 kilowatts. In addition the Bureau began transmitting power from the Fort Peck (Montana) plant, built by the Corps of Engineers, War Department.

The gross revenue from power plants operated by the Bureau rose to a new high of \$14,335,613.01 as compared with \$8,233,477 in the fiscal year 1942.

Power produced at Grand Coulee Dam was consumed chiefly by aluminum reduction industries. From this area came 30 percent of the national output of this important light metal. Also served in this region are many shipyards and other war plants. The Pacific Southwest is to a large extent dependent on power generated at Boulder and Parker Dams on the Colorado River. Here are situated the largest magnesium plant in the world, major airplane factories, and industries producing steel, aluminum, ammunition, ships, and synthetic rubber. This power is also used in mining operations. In the intermountain states, war industries, food processing plants, and military establishments are served.

Boulder Dam power plant moved still further out in front as the largest in the world, its capacity being increased to nearly a million kilowatts by the addition of two more generators.

Grand Coulee took its place as the world's third largest hydroelectric development with an installation at the end of the year of nearly a half million kilowatts. Two units of more than 70,000 kilowatts each were transferred to this power plant from Shasta Dam (Central Valley project, California) to make their output available a year ahead of schedule. The Shasta powerplant was not ready to receive the machines and others would be available when the plant was completed.

Two units of more than 10,000 kilowatts each were installed in the Green Mountain Dam power plant, the first feature of the Colorado-Big Thompson project (Colorado) to begin operation.

The War Production Board late in 1942 permitted installations rated at 776,000 kilowatts to proceed at five projects, while halting installation of 865,000 kilowatts. In addition to the new generators at Boulder, Parker, Grand Coulee, and Green Mountain Dams, which have gone into operation, other installations were excepted from a general stop-construction order. These included an additional generator at Boulder Dam, to be in service in October 1944; three generators at Grand Coulee, scheduled to be in operation by February 1944; two generators of more than 70,000 kilowatts at Shasta Dam, to begin operating by March 1944; and a 97-mile transmission line from Shasta Dam to Oroville, Calif., over which Shasta power will be delivered for distribution to war industries in northern California.

Power installations scheduled for service before 1945-46, which were halted, totaled 865,600 kilowatts. These included generators at Keswick Dam of the Central Valley project, and Anderson Ranch

Dam of the Boise project (Idaho), where all construction work was limited. Work was barred on Davis Dam and power plant on the Colorado River in the Pacific Southwest and on facilities which would have made possible installations at six power plants (other than Green Mountain Dam) on the Colorado-Big Thompson project. Three big generators for the right powerhouse at Grand Coulee Dam and an additional machine for Shasta Dam were also barred.

WATER SERVES WAR INDUSTRIES

In addition to providing power for war industries and irrigation water for increased food production, Reclamation projects made available, as a third major war contribution, a reliable supply of water for war factories and military centers. Five operating projects provided water and, in addition, a municipal supply for civilian use. Additional construction on one of these projects and on three others which are under construction will extend this service in the future.

Los Angeles and 12 other cities of the southern California metropolitan area, and the world's largest magnesium plant near Las Vegas, Nev., receive fresh water from the Colorado River through the Boulder and Parker Dam system.

The Contra Costa Canal of the Central Valley project (California) is the source of a supplemental supply for the cities of the upper San Francisco Bay region and for industries in the Pittsburg, Calif., area. Military encampments near El Paso, Tex., are dependent on the irrigation reservoirs of the Rio Grande project (Texas-New Mexico); and the cities of Salt Lake, Provo, and Ogden on projects in Utah.

To provide added industrial and domestic water for the increased population of the Salt Lake and Provo areas, resulting from the establishment of large military centers and from the expansion of industry, the Bureau, under limited War Production Board clearance, is continuing enlargement of the Weber-Provo Canal part of the Provo River project. This construction also will provide a supplemental supply of irrigation water for a large area of land.

The other three projects under construction are the Altus project (Oklahoma), the Rapid Valley project (South Dakota), and the Tucumcari project (New Mexico) which will supplement existing municipal storage for the cities of Altus, Rapid City, and Tucumcari, respectively, as well as irrigate land in the vicinity of each.

TABLE 1.—*Reclamation areas and crop returns, calendar year 1942¹*

	Irrigable area ²	Irrigated area	Area in cultivation (paying area)	Crop values	
				Total	Per acre

Increase or decrease, 1941-42	-93,877	+487,852	+496,612	+112,162,519	+22.87

¹ A detailed table of area and returns by individual projects is available on request from the Bureau of Reclamation, Washington, D. C.

² Area for which the Bureau is prepared to supply water.

³ Includes Imperial Valley (California) served by the All-American Canal (not previously reported).

⁴ Decrease from 1941 to 1942 explained by readjustments of estimated acreage.

CROP VALUES SOAR TO NEW HIGH

The gross value of crops produced on land which is served by Reclamation facilities rose to a record high of \$272,048,516 during the calendar year 1942. The figure for the first time included returns, amounting to \$38,163,991, from the Imperial Valley of California, wholly served for the first year by the All-American Canal of the Boulder Dam system. Exclusive of the Imperial Valley, the gross returns from Reclamation projects in 1942 was 45½ percent greater than in 1941, when the grand total was \$159,885,997, and 100 percent greater than the next previous high, \$117,788,677, set in 1940 (see table 2).

These totals probably would be increased more than 25 percent if the value of livestock fattened on Reclamation projects, and of dairy and poultry products were included. The gross values are also exclusive of returns from two supplemental water projects.

The over-all cultivated acreage rose from 3,380,460 in 1941 to 3,877,072 in 1942. Most of this increase was due to the inclusion of 410,768 acres in the Imperial Valley of California. On projects that were constructed entirely by the Bureau, and on projects that were furnished supplemental storage water from Bureau works, the cultivated acreage totaled 2,670,421 and crop values, \$193,783,707 (including Imperial Valley returns). These totals compare with 1941 figures of 2,178,288 acres and \$110,399,807. The cultivated acreage under special and Warren Act contracts, which receive supplemented water from Bureau works, rose from 1,202,172 in 1941 to 1,206,651 in 1942 and the crop values from \$49,486,191 to \$78,264,809.

Farmers on Bureau of Reclamation projects produced large quantities of war crops, including an estimated 2,841,162 bushels of dry

edible beans, 27,329,085 bushels of white potatoes, and 2,744,970 tons of alfalfa. Translated into annual supplies for civilians, this production would supply beans for 22 million persons, potatoes for 13 million, and, through alfalfa for beef and dairy herds, beef for 4½ million persons and milk for 3¾ million.

In 1942 the area planted to sugar beets was 138,407 acres, an increase of 37,188 acres over 1941. The production was 1,775,559 tons—a record output and indicative of the response of Reclamation farmers to appeals for meeting the national sugar shortage. The yield per acre was lower than the yields of previous years, due primarily to inadequate labor. In the spring of 1943 an average decrease of 29.6 percent in beet acreage planted was reported from 24 projects due to labor and price conditions.

Other crops that are grown on Reclamation projects include fruit and nuts, vegetables, small grains, long-staple cotton, flax, hops, and seeds.

Due to war conditions no new land was opened to entry on the projects during the year.

¹ Includes projects constructed by the Bureau of Reclamation and those for which supplemental water is furnished from storage works built by the Bureau.

² Estimated.

³ Does not include project acreage and returns from All American Canal (Imperial Valley) and 5 supplemental water projects.

⁴ Does not include project acreage and returns from All American Canal (Imperial Valley) and 2 supplemental water projects.

CONSTRUCTION ACTIVITIES CURBED

The War Production Board, late in 1942, ordered construction halted on all Reclamation projects excepting power installations on five projects, Parker Dam, Boulder Dam, Columbia Basin (Grand Coulee), Colorado-Big Thompson (Green Mountain Dam), and Central Valley (Shasta Dam and the Shasta-Oroville transmission line). Inability to obtain critical materials previously had greatly limited construction.

Cognizant that the future food demands of the Nation would exceed its current agricultural production capacity, the Bureau waged a vigorous campaign throughout the remainder of the fiscal year to bring about cancellation of the stop-construction orders.

Appeals were made to the Facility Review Committee of the War Production Board. As a result, additional work was permitted to proceed under specified limitations on certain facilities of the following irrigation and municipal water projects:

Gila (Arizona): 5,500 acres for the production of guayule rubber.

Shirley and Terry units, Buffalo Rapids No. 1 project (Montana): where facilities, which would serve 8,150 acres, were nearing completion.

Yakima-Roza project (Washington): where facilities, which would serve 5,000 acres, were nearing completion.

Buford-Trenton project (North Dakota): where facilities, which would serve 14,800 acres, were nearing completion.

Gooding Division of the Minidoka project (Idaho), Tule Lake Division of the Klamath project (Oregon-California), and Heart Mountain Division of the Shoshone project (Wyoming): to provide employment for Japanese evacuees.

Mancos project (Colorado), Rapid Valley project (South Dakota), and Deschutes project (Oregon): to provide employment for conscientious objectors in Civilian Public Service Camps.

Lugert-Altus project (Oklahoma): construction of Altus Dam to a height sufficient to provide a supplemental supply of water for the city of Altus near which a large military activity is located.

Provo River project (Utah): enlargement of the Weber-Provo Canal to bring industrial water to a new steel plant.

Plans were under way to complete Friant Dam by installing control valves borrowed from Boulder Dam, and the Madera Canal, two features of the Central Valley project (California). These features were given clearance by the War Production Board. Two power plants, at Parker Dam on the Colorado River and Green Mountain Dam of the Colorado-Big Thompson project (Colorado), were com-

pleted. Excavation of two major tunnels was continued until late in December when stop-construction orders went into effect. They were the 13-mile Continental Divide tunnel (Colorado-Big Thompson project) and the 6-mile Duchesne tunnel (Provo River project, Utah).

Action of the Rubber Director in reducing the scope of the guayule program, resulted in adjustments of the plans for construction on the Gila project. The acreage to be served was increased from 5,500 to 8,500 acres for dust control in the vicinity of the Yuma air base, and for the production of alfalfa for livestock feed.

Construction at the end of the year remained at a standstill or was restricted because of War Production Board orders (exclusive of power installations) on the following projects: the Coachella Branch of the All-American Canal (California); the Friant-Kern Canal of the Central Valley project; Mirage Flats (Nebraska); Tucumcari (New Mexico); Eden, Kendrick, and Riverton (Wyoming); Davis Dam (Arizona-Nevada); Anderson Ranch Dam and Payette Division, Boise project (Idaho); Buffalo Rapids No. 2 (Montana); Provo River (Utah); and Columbia Basin (Washington).

WATER CONSERVATION PROGRAM PROGRESSES

Construction proceeded on 8 projects under the Water Conservation and Utilization program, the purpose of which is to stabilize agricultural production and employment in the Great Plains and similar areas suffering periodic droughts. One of the projects, Buffalo Rapids No. 1 (Montana), under which 15,500 acres of land were brought into cultivation, was completed. Water was delivered for the first time on the Buford-Trenton project (North Dakota) this spring, to 9,000 acres. This acreage may be expanded to 14,800 during the year.

The 8 projects when completed will irrigate 94,000 acres of land and will benefit nearly a million acres of range land valuable for the support of livestock. In addition to the above two, the projects in this program are: Eden (Wyoming), Rapid Valley (South Dakota), Newton (Utah), Mirage Flats (Nebraska), Buffalo Rapids No. 2, (Montana), and Mancos (Colorado).

Construction progress was seriously retarded by the disbandment of the Civilian Conservation Corps and the Work Projects Administration which had contributed nonreimbursable labor for construction. Stop-construction orders of the War Production Board relating to six of the projects brought work to a halt. These were issued late in 1942 and were in effect for the remainder of the fiscal year.

On June 24, 1943, President Roosevelt authorized construction of the Scofield project (Utah) for flood control. A new earth-fill dam, which

will also provide irrigation water to 12,500 acres of land, is to be constructed.

Fifty-two Projects in 41 Years

One hundred and sixty-seven dams and 30 power plants have been constructed by the Bureau of Reclamation in connection with the construction of 52 irrigation or multiple-purpose projects since the passage of the Reclamation Act of 1902. In addition, the Bureau has built 5,822 miles of transmission lines, 5,106 miles of ditches and drains, 210,487 canal structures, 14,357 bridges, 23,401 culverts, 6,498 flumes, 381 tunnels totaling 108 miles in length, 2,290 miles of pipe, and 4,208 miles of road. In building these structures 611,560,346 cubic yards of earth and rock were excavated and 33,203,253 cubic yards of concrete (containing 37,310,546 barrels of cement) were placed.

Shasta Dam Nears Completion

Shasta Dam on the Sacramento River, dominant structure of the vast Central Valley project (California) and one of the three largest concrete dams in the world, was 87 percent complete at the end of the fiscal year. Ultimately to be higher than Grand Coulee and more massive than Boulder, Shasta will contain 5,556,667 cubic yards of concrete. The first crest block was poured in April.

Two of five generators, each rated at more than 70,000 kilowatts, are being installed and will be ready for commercial production by March 1944.

Stop-orders which the War Production Board issued late in 1942, affecting Friant Dam, Keswick Dam, and the Madera Canal, all prominent features of the Central Valley development, were modified late in the fiscal year. Concrete work was resumed on Keswick Dam, to bring it to full height and to complete the powerhouse building. The Bureau advertised for bids on the Madera Canal construction and plans were completed for borrowing three 84-inch needle valves from the Boulder Dam outlet works for installation at Friant Dam to control diversion of the river's flow to the irrigation canal system.

Yakima-Roza Developed Rapidly

Irrigators on the Roza division of the Yakima project (Washington) kept ahead of canal construction in preparing their land for cultivation. Many planted their crops before their farm ditches were completed. About 14,000 acres of land had been brought into production. Plans were under way to bring 18,500 acres under irrigation during 1944 following a recommendation of the War Food Administration for resumption of work on the project.

FIELD INVESTIGATIONS ON WARTIME BASIS

The project planning activities of the Bureau of Reclamation since 1941 have been geared to war and post-war considerations. The investigation and study of the land and water resources of the 17 western states is preliminary to the preparation of plans for the development of irrigation and multiple-purpose projects, including power installations.

Studies and investigations by the Bureau cover entire river basins and their subdivisions, followed by studies and investigations of individual projects fitting into the pattern of an economic basin development. This avoids the haphazard construction of individual projects without consideration of each region as a whole.

Investigations in the upper Missouri River states are representative of basin-wide studies. These extend from the headwaters in Montana and Wyoming to Yankton, S. Dak., and to the subbasins of the Platte and Republican Rivers. As a result of the data assembled, Commissioner Page in October 1942 proposed that the Missouri River Basin states seek the consent of Congress to negotiate a compact dividing the waters of the river in the best interests of the inhabitants of the area for irrigation, power, flood control, and navigation. A Missouri Basin states committee was formed at Omaha in May 1943 to further the development of the river.

During the fiscal year the investigations had two major objectives. The first was the extension of irrigation to increase food production. The second was the development of a shelf of projects for inclusion in a comprehensive post-war public works program.

During the year, 150 irrigation and multiple-purpose projects and 38 river basins and subbasins were actively under investigation.

Progress on 35 projects warranted their being listed as desirable for immediate construction as part of the war food production program. On 41 others, field work and studies were advanced to the point where immediate preparation of construction plans for post-war execution was scheduled. Projects not approved for construction because they would not produce food in sufficient quantities in time to aid the prosecution of the war and others whose feasibility has been determined can be included in the post-war reserve.

With the objective of providing additional electric power for vital war production in the West, final reports were completed on 3 power projects and detailed surveys continued on 8 others. Preliminary reports on 27 developments, including the above 11, were completed in fiscal year 1942.

In addition to the foregoing activities the Bureau also reviewed flood control reports of the Corps of Engineers, War Department, in

numerous stream basins in California. This work is being carried on under the terms of an agreement dated August 14, 1939, by which the Bureau of Reclamation, the Corps of Engineers, and the Department of Agriculture interchange information on multiple-purpose projects. This coordination and cooperation provides for maximum utilization of water resources of each region.

POST-WAR PROGRAMMING IN PROGRESS

At the end of the war, providing employment opportunities for returning service men and emergency industrial workers will be one of the Nation's greatest responsibilities. Recognizing that the solution of this grave problem is dependent on advance preparations, the Bureau continued the development of a post-war public works program involving construction of 150 to 200 irrigation and multiple-purpose projects.

The program would provide 3 billion man-hours of work—equivalent to 3 years employment for 480,000 men. Tentative estimates place the construction cost at about 3 billion dollars.

Projects which are not completed as part of the war food program will be added to the post-war reservoir. As rapidly as current investigations can be carried out without impeding the Bureau's war activities, the list of projects will be enlarged.

In addition to providing employment, the program will prove a stabilizing influence in western economy. It will extend the Bureau's irrigation service to 15,000,000 acres of land. Settlement opportunities will be provided on newly irrigated land for 125,000 farm families. By supplementing existing irrigation supplies the Bureau will make it possible to settle 40,000 additional families on land now inadequately irrigated. Through the construction of hydroelectric installations, 3,300,000 kilowatts of new power can be provided.

Special Studies Advanced

To assure the best results from irrigation facilities under construction or proposed, the Bureau advanced special studies directed at agricultural and other economic problems on three projects.

An interim report was in preparation on the Columbia Basin Joint Investigations, inaugurated in connection with the large area to be irrigated in Washington from Grand Coulee Dam. This report will outline a program for the development and settlement during the post-war period of lands which cover an area larger than the State of Delaware.

Progress was made on the Central Valley Project Studies which were announced in 1942 as a means of assuring the best results from the construction in California of the most complex multiple-purpose project the Bureau has undertaken. As in the Columbia Basin Joint Investigations, many Federal and State agencies are participating.

The Yuma Mesa (Gila project, Arizona) Predevelopment Committee continued its plans for launching a large scale demonstration of the productivity of desert mesa lands under irrigation. The Appropriations Committee of the United States Senate on June 17, 1943, reaffirmed recommendations for this work. In approving a dust control program for the project to protect a nearby Army airbase, the committee urged alfalfa production for war food purposes. It also directed that the Bureau should seek to obtain the greatest permanent benefit possible from the wartime activities on this and other projects.

Structures Protected Against Sabotage

Approximately 650 Federal guards continued to protect vital Reclamation dams, power plants, and irrigation structures where saboteurs might strike. Vigilance was maintained on a 24-hour basis. Flood lights, steel fences, and other protective devices aided the officers.

Laboratory Streamlines War Work

Faster construction methods and the use of alternative designs and substitute materials resulted from the activities of the Bureau's engineering laboratories in Denver toward solving problems introduced by the shortage of manpower and strategic materials.

The laboratory facilities served the Bureau's needs and were used extensively by other agencies of the Government. These included the War and Navy Departments, the Maritime Commission, the War Production Board, the Public Roads Administration, the Tennessee Valley Authority, and the Panama Canal.

TABLE 3.—Settlement and economic data, 1942

Project Operators Increase Food Output

Increased production of critical foodstuffs to meet expanding demands resulted from the activities of the Division of Operation and Maintenance, with headquarters in Denver. Results were achieved by urging farmers to cultivate small undeveloped tracts of holdings, and by encouraging them to shift from less essential to more important war crops.

Cooperative arrangements were continued with the Farm Service Administration, which extends financial assistance to settlers on undeveloped Reclamation areas, including Water Conservation and Utilization projects, and with the Extension Service of the Department of Agriculture, whose agricultural specialists assist farmers in matters on new Bureau developments.

As part of the Bureau's educational program, a new film "Better Pastures" was completed and released. This and other movie lectures, and circulars, designed to assist farmers in making the most economical use of available water supplies, in preventing soil erosion, and in eradicating noxious weeds, were widely distributed during the year among farmers and local organizations on the West, and in communities of the West.

Reclamation Lands Leased

More than 625,000 acres of public land (withdrawn by the Bureau in connection with completed or partially completed projects under investigation) were under lease at the end of the year. Approximately 580,000 acres are being grazed and 45,000 being utilized for crop production. In addition, approximately 100,000 acres of Reclamation withdrawn lands have been temporarily transferred to the Grazing Service for supervision in the carrying out of efficient range administration under the Taylor Grazing Act.

Soil and Moisture Problems Studied

Control of erosion and prevention of seepage in irrigation systems was the major activity under the Soil and Moisture Conservation program. Much field testing work was done on a number of projects in placing and testing various types of canal linings and in experimenting with different types of vegetation as soil retention measures. Programs previously initiated for better control and use of land were carried forward by means of demonstrations, experimentation in the laboratory and field studies.

Revised Repayment Contracts Negotiated

Eight amendatory repayment contracts were negotiated with water users' organizations under the Reclamation Act of 1939 which provides for adjustment of existing schedules according to the ability of water users to pay. Several other new contracts of 37 requested are in the stage of negotiation and approval. Due to present and anticipated augmented incomes, water users on several projects have indicated that there is no desire for early action on amendatory contracts. Approximately 200,000 acres on 11 irrigation projects are in progress of reclassification under the act of 1939.

Marked Decrease in Requests for Relief

Reflecting increased crop values over all Reclamation projects, the fiscal year 1943 saw a marked decrease in the number of applications received for relief from payment of accrued construction charges. Applications were submitted by 6 water users' organizations and 7 individuals, aggregating \$189,922.44. At the end of the year relief has been granted to 4 water users' organizations for a total amount of \$24,530.

In comparison, applications were received in the fiscal year 1942 totaling \$1,061,556 from 22 water users' organizations. Relief in the total amount of \$535,432.85 was authorized.

Japanese Evacuees on Three Projects

Thirty-six thousand persons of Japanese ancestry, evacuated from the Western Defense Zone on the Pacific Coast, occupied relocation centers on three projects. Camps of 10,000 persons each were completed and occupied early in the fiscal year on the Gooding division of the Minidoka project (Idaho), and on the Heart Mountain division of the Shoshone project (Wyoming). Sixteen thousand evacuees had moved into their temporary war quarters on the Tule Lake division of the Klamath project (Oregon-California) late in the previous fiscal year. The original plans contemplated that the evacuees would do much of the remaining construction work on these projects. Difficulties in obtaining critical materials and equipment made it necessary to limit activities to completion of irrigation facilities for an area considered adequate for the subsistence of the occupants of each center. Work on this restricted program was in progress during the year with several thousand acres under irrigation. The remainder of the acreage required will be developed during the next fiscal year.

The centers were constructed by the Army Engineers. The Bureau supervises the irrigation construction work done by the Japanese.

Civilian Public Service Building Dam

A moderate-sized earth-fill dam is being constructed on each of three projects under arrangements made with the Selective Service System for the establishment of three Civilian Public Service camps for conscientious objectors. These forces also clear the reservoir sites and participate in canal construction.

Camps were first occupied during the year on the Rapid Valley project (South Dakota) and on the Deschutes project (Oregon) with a religious organization responsible for the welfare of the men. A supervisory staff was assembled in June for a camp to be operated entirely by the Bureau of Reclamation on the Mancos project (Colorado). The first assignees to this camp are due in July 1943. At the end of the year 116 men were stationed at the Rapid Valley camp and 153 at the Deschutes camp.

C. C. C. and W. P. A. Disbanded

Operations on Reclamation projects of the Civilian Conservation Corps and the Work Projects Administration were terminated during the year.

All but seven C. C. C. camps had been closed by the end of fiscal year 1942. The remaining camps, located on Water Conservation and Utilization projects, were suspended by August 1, 1943. Although the war had greatly reduced the extent of the operations of the Work Projects Administration, it was not until early in 1943 that the order was given for its liquidation. The C. C. C. enrollees and the W. P. A. workers contributed construction labor on a nonreimbursable basis.

Under the act of July 2, 1942, the Bureau was required to participate in disposing of C. C. C. equipment, supplies, and buildings valued at many million of dollars most of which was transferred to the War and Navy Departments and the Civil Aeronautics Administration.

NEW LEGISLATION ENACTED

Two major pieces of legislation, the Columbia Basin Project Act and the Republican River Compact Consent, were enacted during the fiscal year. Another measure, presented late in the fiscal year, was the amendments to the Water Conservation and Utilization (Wheeler-

Case) Act, gearing the construction program carried out under that law to war needs.³

Columbia Basin Project Act Passed

In planning for the settlement and development of 1,200,000 acres on the Columbia Basin project (Washington), which is scheduled for construction, the Bureau encountered the difficult question of how to get the raw land to settlers at its reasonable value without speculative increment on account of prospective irrigation.

The prime purpose of the Columbia Basin Project Act (Public Law 8, 78th Cong., 1st Sess.) is to meet this problem squarely. It requires owners of land in excess of specified acreages to sell the excess acreage at the Government appraised values. Owners who dispose of any holdings within 5 years after water is available must sell at not more than the appraised values. Appraisals are based on dry land or pre-irrigated values.

Other basic purposes of the act are: (1) to reauthorize the project as one subject to the repayment principles of the Reclamation Act of 1939 (53 Stat. 1187); (2) to authorize the Secretary of the Interior to acquire, sell, exchange, or lease project lands and adjacent lands, to establish town sites, and to dedicate portions for public use, all in aid of and for the protection, development, or improvement of the project; (3) to anticipate local taxing problems, arising out of the acquisition of lands by the United States, by authorizing the payment, out of funds derived from the lease of these lands, of sums in lieu of taxes to the State of Washington or its political subdivisions.

Construction of the main pumping plant and balancing reservoir is authorized, but other work on the irrigation system must await execution of repayment contracts with the irrigation districts in which the project lands are located.

Consent to Republican River Compact

The Republican River Compact provides for the equitable apportionment of the waters of the Republican River and its drainage area among the three States of Colorado, Kansas, and Nebraska, thereby removing the basis for interstate litigation and laying the groundwork for the development of the water resources of the river basin.

The consenting legislation is noteworthy also in that, to conform to the compact, it provides for Federal consultation with state compact officials with respect to certain Federal programs or projects

³ This measure became Public Law 152, 78th Cong., 1st Sess., approved July 16, 1943.

and requires the Federal Government to respect certain established water rights as property.

Congress in 1942 gave its consent to a compact entered into by the three States allocating the waters of the river on an equitable basis, but the consent was vetoed by the President because of its potentially adverse effect upon Federal activities in the area.

Subsequently the states and representatives of interested Federal agencies met and revised the compact to meet the objections contained in the veto message. The legislatures of the three states meeting early in 1943 approved the compact and a bill to grant the consent of Congress became law on May 26, 1943 (Public Law 60, 78th Cong., 1st Sess.).

W. C. U. Amendments Proposed

To fit the construction of projects under the Water Conservation and Utilization program to the war food production program, amendments to existing legislation relating to these projects were drafted during the fiscal year.

The amendments authorize, for the duration of the war, the expenditure for project construction of appropriated funds in lieu of contributions of labor and materials formerly made by the defunct Work Projects Administration and the Civilian Conservation Corps. The law will permit using prisoners of war in the construction of projects, subject to regulation by the appropriate Federal agency.

The new legislation also will facilitate the speedy construction and administration of projects thus permitting quick expansion of productive acreage to meet the critical food shortage.

A wartime Reclamation Act (H. R. 3018), which seeks to permit the Bureau to speed the construction and operation of irrigation projects, was pending when the Congress recessed for the summer.

BUREAU DECENTRALIZATION PLAN COMPLETED

After long consideration, plans for decentralizing the Bureau of Reclamation to assure a full utilization of the land and water resources of the West to meet war and post-war requirements were completed during the year. Under the program,⁴ six major field offices, headed by Regional Directors of Reclamation who would be directly responsible to the Commissioner of Reclamation, would be established.

The reorganization plan, it is felt, will provide for a more thorough understanding of area problems and of the needs and potentialities of

⁴ The plan was put into effect on September 9, 1943.

each area than has been possible heretofore through the Washington, D. C., headquarters and Denver (Colo.) engineering office. It is proposed to establish regional offices at Boise, Idaho; Sacramento, Calif.; Boulder City, Nev.; Salt Lake City, Utah; Amarillo, Tex., and Billings, Mont.

The plan would also establish four branches with offices at Denver. These are: the Branch of Design and Construction, which will assume the design and construction responsibilities of the Office of the Chief Engineer at Denver; the Branch of Project Investigations, which will perform the work now done by the Project Planning Section of the Chief Engineer's office; the Branch of Operation and Maintenance, which will carry out the functions of the Operations and Maintenance Division, as presently constituted, for irrigation activities; the Branch of Fiscal and Administrative Management, which will assume the duties of the Office of the Chief Accountant, including the central accounting office, and those of the general clerical section of the Office of the Chief Engineer.

Military furloughs, transfers, and stop-work orders restricting construction reduced the number of Reclamation employees from 8,016 on June 30, 1942, to 6,543 on June 30, 1943. Twelve Washington office employees and 1,373 field employees were in the armed forces of the United States.

The number of field offices, exclusive of headquarters of project investigations, was reduced from 57 to 54.

The Bureau pay roll was segregated as follows: 5,623 employees engaged in construction or operation and maintenance on field projects; 773 in the field headquarters at Denver; 49 attorneys and clerical employees engaged in field legal work under the supervision of the Chief Counsel; and 98 employees in the Washington office, including the Commissioner, the Assistant Commissioner, and several who are detailed to other offices.

Commissioner Page Resigns

Due to ill health John Chatfield Page, Commissioner of Reclamation since January 25, 1937, resigned his position in June. His resignation was to be effective upon appointment of his successor. When his health permits, Mr. Page then will resume his active association with the Bureau as consulting engineer with headquarters at Denver. He first joined the Bureau early in 1909. After 2 years'

Reclamation Fund Accretions

service in other fields, he returned in 1911 to serve continuously thereafter.

Accretions to the Reclamation Fund, created by the Reclamation Act of 1902 (table 4), brought the total cash available from this source in 41 years to \$216,691,943.81. Collections—construction and operation and maintenance repayments, water rentals, power, etc.—were \$148,346,928.86. Disbursements totaled \$344,595,311.90, leaving a balance in the fund on June 30 of \$20,443,560.77.

Construction repayments to the Reclamation fund during the year totaled \$3,116,583.23; operation and maintenance collections amounted to \$1,298,081.11; and water rental, power, and other receipts aggregated \$2,665,801.74.

The total collections, which are the highest with the exception of two years in the history of the Bureau, reflect the improved conditions of Reclamation farmers and their response to the President's anti-inflation policy through maintaining payments. The high level of the Reclamation fund provides a backlog of resources for the extension of irrigation when the resumption of construction is possible.

Federal Investment Increased

Expenditures for construction on all projects during the year totaled \$53,336,884.87 bringing the federal investment to \$870,105,474.92 (see table 5).

Due to war restrictions on construction of irrigation systems, the major expenditures were on facilities which would expedite the generation of power for war production. These expenditures, however, advanced the completion of facilities which will aid irrigation through additional storage. The power revenues for these installations will assist in financing the cost of irrigation systems.

Preliminary studies indicate that when the Reclamation construction program as laid out at the beginning of the war is completed, about 50 percent of the repayable costs will come from power revenues and approximately 45 percent from irrigation. The remaining costs will be allocated to nonreimbursable purposes—flood control, navigation, and contributed labor—or will be repayable by municipalities for supplemental water supplies.

For the fiscal year 1944, Congress appropriated \$21,044,000 for construction of irrigation facilities. With unexpended balances on June 30, 1943, this brings to \$54,745,450 the funds available for extending irrigation for war food production. New appropriations by Congress for power and multiple-purpose facilities, which will also aid irrigation, flood and salinity control, or navigation, totaled \$13,149,000. The unexpended balance for power and multiple-purpose facilities brings to \$55,340,200 the total available for construction of this type. The Bureau thus has available for the fiscal year 1944 a total of \$100,085,650 for construction purposes. Under existing war conditions, irrigation construction is subject to recommendations of the War Food Administration to the War Production Board and approval by the latter agency. Similarly, the construction of power facilities is governed by rulings of the War Production Board.

TABLE 5.—Consolidated summary statement of construction cost of reclamation projects ¹

	Construction cost		Operation and maintenance before public notice (net)		Operation and maintenance deficits and arrearsages and penalties		Construction revenues, contributed funds, and nonreimbursable appropriation		Abandoned nonreimbursable cost and authorized charge-offs		Total repayable

Office of Solid Fuels Administration for War

HOWARD A. GRAY, Deputy Administrator

EXPANSION of the United States war program has created enormous demands for coal with requirements keeping pace with the quickened tempo of armament production. Increased production has been required to fill the demands of industry, particularly steel, public utilities, railroads, and as raw material used in the manufacture of explosives, synthetic rubbers, plastics, medicines, and other essentials.

Shifts of population to war-production centers and the concentration of soldiers and sailors in training camps and naval stations brought increased demands for coal. Conversions of heating plants from petroleum to coal also contributed to the necessity for a greater supply of coal.

Increased requirements have been accompanied by changes in the distribution pattern and difficulties in meeting demands were accentuated by acute manpower and equipment shortages, and by labor disturbances.

Three general coal mine strikes resulted in reducing the amount of coal produced by approximately 25,250,000 tons.

By Presidential Executive order on May 1, the Secretary of the Interior took possession and control of mines producing 50 tons or more per day, on which work stoppages or strikes had occurred or were threatened. The Solid Fuels Administration directed operation of the mines until the end of the fiscal year, when this task was turned over to the newly-organized Coal Mines Administration.

During the year essential demands for coal were supplied and the largest protective stock piles in the history of the industry were built. Production of bituminous coal reached record heights and anthracite output was the largest since 1930.

Deficiencies in the production of certain types and sizes of coals, uneven distribution of protective stocks and increasing requirements in certain areas were recurrent problems requiring constant attention.

Establishment of the Solid Fuels Administration for War followed issuance of Executive Order No. 9332 on April 19, 1943, designating the Secretary of the Interior as Administrator. The new organization absorbed the personnel and the records of the former Office of Solid Fuels Coordinator, which had been set up by Presidential request on November 5, 1941.

The Executive order granted definite authority while the former office had been empowered only to recommend and advise.

Within a few weeks after its establishment, the new authority was exercised in meeting the complex problems raised by the strikes and the Government's control of the mines. These were handled expeditiously through an organization which was assembled with the cooperation of the Bituminous Coal Division and the Bureau of Mines.

Through its organization of the coal industry in the previous fiscal year and with the assistance of the Solid Fuels Advisory War Council, the Office keyed the Nation's coal program to the estimated requirements for 1943. Based on careful studies it estimated 1943 production requirements for bituminous coal at 600,000,000 tons and for anthracite at approximately 65,000,000 tons.

These figures represented increases of 20,000,000 tons over preliminary 1942 bituminous output estimates (which exceeded the previous record of 1918) and about 5,000,000 tons above 1942 anthracite production.

The heavy 1942 production was made possible by a coal-stocking campaign which the Office pressed vigorously to provide an outlet for mine output during the normally slack summer months. By December 1, despite increasing consumption, bituminous stocks were approximately 90,874,000 tons, about 15,000,000 tons above the previous 1927 record. Total anthracite stocks were also believed to be above normal.

While rising consumption cut bituminous stocks during the winter, at the end of the fiscal year stocks were estimated at 74,028,000 tons, a substantial cushion against emergencies which might arise. These stocks however, were unevenly distributed, with wide differences between individual consumers and classes of consumers.

In cooperation with the Office of War Information, other Government agencies, railroad and industry groups, we carried out a Nation-wide campaign to stimulate early ordering of coal.

National radio commentators and radio stations cooperated in the campaign which, because of the tight supply in anthracite, was definitely directed to bituminous coal consuming areas.

The Office of War Information disseminated material relating to the campaign through all media.

The Administration, through the Department of the Interior Radio Section, prepared and distributed radio records which carried the Order-Coal-Now message. These were distributed free to retail coal dealers and other participants in the campaign, and were used on radio advertising programs. The radio time in all cases was paid for by the campaign participants.

Cooperation with civic groups has been freely given and the advice of the Administration has been sought by organized retail groups, civic committees and newspapers interested in the campaign.

Public response to the campaign was reflected in the increased number of orders reported by coal dealers.

The major problems of the coal industry—manpower and equipment shortages—increased during the year in spite of every effort at their solution. Estimates indicated a net loss of upwards of 60,000 miners in 1942, and these losses to the armed services and industry were continuing in 1943. Manpower losses likewise hampered retail distribution, restricting its capacity.

While the Solid Fuels Office repeatedly brought the manpower situation to the attention of the War Manpower Commission and the Selective Service System in an effort to halt or retard the critical drain on the industry, marked losses in potential capacity for production and distribution were directly traceable to heavy labor turn-over.

The coal supply would have been further reduced except for the establishment of the 42-hour, 6-day week, in the mines which was instituted at the behest of the Office.

Earlier, labor, at the request of the Solid Fuels Coordinator, relaxed restrictions against Sunday and holiday overtime work in mines in Oregon, Washington, Wyoming, Utah, Colorado, and New Mexico.

The Office collaborated closely with the War Production Board in providing equipment and materials for mining operations. Likewise, it worked with the Reconstruction Finance Corporation which furnished financial assistance for many of these purchases and for the extension of mining operations.

Close collaboration with the Office of Defense Transportation, the War Shipping Administration, and the Association of American

Railroads facilitated the movement of coal and in many instances averted serious disruption of industrial activity.

The greater volume of coal and longer rail hauls have put increased strain upon the railroads' car supply in spite of efforts to speed "turn-around" time and increase car loadings.

Three general areas, where transportation has caused problems, are:

1. New England, where increased requirements have arisen from war industries and because of fuel-oil conversions. Normally this area received most of its coal by tidewater colliers. Submarine activity and diversion of colliers necessitated a greater movement by rail. Now the bulk of the region's coal moves by the long all-rail haul direct from the mines or by a long rail haul to barge terminals where it is transhipped for water movement. Because of the special problems of New England, a Solid Fuels Office was opened in Boston in December 1942.

2. The Great Lakes area, which is served by coal cargo vessels, and especially the Lake Superior and west bank of Lake Michigan regions, which are virtually inaccessible to coal moved by rail. The delayed opening of lake navigation in 1943, coupled with serious loss of tonnage because of strikes, put shipments far behind schedule. As the fiscal year ended, every effort was being put forth to move more coal to the upper lake docks, which had been drained by the long severe winter of the usual "carry-over" stocks.

3. The Pacific Northwest States of Washington, Oregon, and Idaho, where coal requirements had increased sharply due to conversions from other fuels, influx of population, and new war industries. Simultaneously, manpower losses reduced the production of Rocky Mountain and Pacific Northwest mines. A Solid Fuels Office was opened at Seattle in September to keep in close touch with the situation. During the winter, the area's inadequate fuel supply was supplemented by approximately 225,000 tons of eastern coal hauled from the Lake Superior docks by railroad. Lend-lease coal requirements added to the burden in the Northwest.

The most troublesome problem in the fiscal year was in meeting the needs of anthracite users in the Eastern States. Because of spring floods in 1942, production was behind schedule and maldistribution of the output resulted in orders piling up and customers clamoring for coal throughout the season. During January a series of strikes cut production approximately 500,000 tons and at the request of the Solid Fuels Coordinator the industry temporarily suspended anthracite shipments outside of the area until the emergency had passed.

In an endeavor to step up production, the Office assisted War Production Drive Headquarters in conducting a production drive in the anthracite and certain bituminous mines.

However, continuing tightness of the anthracite supply through the spring months, added to the losses of production in the strikes of January, May, and June, necessitated the institution of a temporary anthracite distribution program in June which provided for the equitable distribution of the available supply until a permanent program could be developed.

A major activity of the Administration and its predecessor has been to assure a constant supply of suitable coal for the manufacture of coke used in the iron and steel industry. A field agent was assigned to the Connellsville region to aid in maintaining a constant flow of the proper coals to beehive ovens which supplemented the output of by-product coke plants. New and additional sources of this coal were explored. These activities contributed to maintaining continuous operations of the beehive ovens.

Last November influence was exerted on byproduct coke plants to make fuel contracts for the coal year 1943-44. The Office assisted them in obtaining this coal and induced the industry generally to build up larger stock piles. The wisdom of this policy was demonstrated during the strikes when a great loss of coke output and consequently of steel was averted.

In July 1942, in conjunction with the Bureau of Mines, the Office formed a coke production committee, representing the coke-making industry. Valuable work was done by this committee in investigating the coke problems limiting pig-iron production and in developing a program designed to increase pig-iron output by an estimated average of 50 tons per blast furnace daily.

To keep abreast of current trends, the Office instituted and elaborated various surveys through the Economics Branch of the Bituminous Coal Division. Among these were:

a. A monthly survey of consumption stocks and days' supplies of fuel used by 18,000 manufacturers and a similar report from 15,000 coal dealers.

b. Studies of mine manpower, covering employment, critical shortages, additions, separations, and labor needs.

c. Weekly reports from all river and rail connected mines of more than 50 tons daily capacity showing production, number of days' operation, shifts and time and tonnage lost due to "no orders."

At the Office's request, the Bureau of Mines instituted anthracite distribution studies, and forms for gathering these statistics were almost ready for use at the year's end.

Various studies begun in the year covered other phases of the coal industry, including the more effective use of lake and river transportation.

Besides handling problems as they arose, the Administration neglected no opportunity to prepare for future contingencies. Additional study was made of plans for the emergency distribution of coal in the event that developments might require such close control to ensure all essential needs being met.

Bituminous Coal Division

DAN H. WHEELER, Director

SINCE the Bituminous Coal Act of 1937, administered by the Bituminous Coal Division, expired August 23, 1943, it seems appropriate to appraise the agency's activities during the period from July 1, 1942, through August 23, 1943 (for the purpose of this report referred to as the fiscal year) in the light of the over-all objectives of the act.

Conceived in peacetime as legislation to remedy chronic economic distress in the bituminous coal industry, the statute proved to be an effective war measure and the Bituminous Coal Division readily adapted its activities to performance of direct and vital war work.

CONTRIBUTION OF BITUMINOUS COAL ACT TO WAR PROGRAM

The bituminous coal industry first experienced minimum price regulation under NRA. When the National Recovery Act was declared unconstitutional the price structure for coal became void, but hope of further stabilization by legislation was not abandoned. From 1935 until they became effective October 1, 1940, under the Bituminous Coal Act, minimum prices established by law seemed always imminent. The hope of ultimate statutory relief from their economic distress influenced many operators to remain in a business in which they were losing capital. Thus enough potential capacity remained after 15 years of continuous annual losses in the industry to permit rapid expansion of production to meet growing war requirements. This explains the ability of the industry to increase production from 461,000,000 tons in 1940 to 580,000,000 tons in 1942 and to attempt to reach a goal of 600,000,000 tons in 1943.

Freed from unfair competition through the operation of the act many months prior to the outbreak of war, the industry had been

able to undertake the development of mines necessary to reach the high production level demanded by the war. Orderliness established in the industry and the mechanism for its cooperation with a government agency which resulted from the Bituminous Coal Act helped expedite the handling of the Nation's wartime fuel problems.

Material assistance to many other departments of the Government, mostly in connection with war work, was provided by the Bituminous Coal Division, especially through the Economics and Marketing Branches. Frequently information made available by the routine administration of the act was processed to serve other agencies' needs. In many cases these branches used their trained personnel and existing machinery to make special inquiries. These wartime functions were essential, and with the expiration of the act, either must be discontinued or carried on by specially organized agencies.

The agencies served in this manner by these branches include the War Department, the Navy Department, the War Production Board, the War Labor Board, the Office of Economic Stabilization, the Office of Economic Warfare, the Bituminous Coal Consumers Counsel, the Solid Fuels Administration for War, the Coal Mines Administration, the Office of Price Administration, the Interstate Commerce Commission, the Maritime Commission, and many others. Each branch carried on this special war work together with a large volume of routine work in connection with the administration of the act.

OBJECTIVE OF THE BITUMINOUS COAL ACT

The Bituminous Coal Act was devised by the Congress to stabilize the bituminous coal industry by the equalization of weighted average costs of production with weighted average realizations in each of 10 minimum price areas described in the act. It was designed to achieve this balance without imposing upon the industry a rigidity of costs or a rigidity of prices; without insuring the industry a profit and without proscribing the opportunity for one.

Apparently many misconceptions prevailed as to the meaning of stabilization under the Bituminous Coal Act. As comprehended in this statute, stabilization meant preventing the deterioration of the operating positions of all companies, as a whole, within a price area, under the impact of a competitive price cutting which normally prevailed in the industry. However, stabilization as conceived in the act and competition were not incompatible. On the contrary the stabilization mechanisms under the act were designed to promote the

type of competition which would bring about an orderly outcome of affairs, and to prevent the type which wouldn't. Within the bounds prescribed by the act, it was intended that competition be fair, free, and unrestrained.

It should be observed that the act was designed to stabilize the relationship between costs and prices. The act did not require operators and miners to enter into wage contracts and did not preclude controversy between operators and miners. Its stabilization process began with the completed determination of labor costs and other costs whatever may have been the factors in determining them. Unquestionably it was hoped that the frequency and violence of labor disturbances would be among the effects of instability in the industry which would be lessened by controlling the causes, but the act could not eliminate the fundamental desire on the part of any groups to act in their own self-interest.

ACT OUTGROWTH OF LONG CONGRESSIONAL STUDY

The Bituminous Coal Act of 1937 was the outgrowth of a quarter of a century of investigations of the industry by Congress. These disclosed that the industry had suffered annual losses ranging into millions of dollars for at least 15 years prior to 1937. Indeed the whole history of the industry since shortly after the First World War was revealed as a long record of huge financial losses to investors with consequent widespread bankruptcies; lack of employment for miners with consequent impoverishment of entire mining communities; and a trend toward low wages with consequent strikes frequently accompanied by violence. The general instability of the industry was found to have led to price discrimination against smaller consumers and to the wasteful and ruthless exploitation of the Nation's bituminous coal resources.

Long studies of the industry made it apparent to the Congress that these unhealthy economic conditions had arisen as the outgrowth of competition based on price-cutting below cost levels and other unfair practices. These practices, in turn, were found to stem from excess production capacity and peculiarities inherent in coal mining. The problems of the industry appeared to be of a nature which defied solution by the industry itself, although they threatened its complete dissolution. The bituminous coal industry is national in scope. It is indispensable to the country's industrial civilization. It operates in 29 States, provides 75 percent of the fuel for manufacturing, about 80 percent of the fuel for railway locomotives, and about 70 percent

of the fuel for steam-generated electricity. In accordance with its traditional policy, Congress decided to stabilize the industry by legislation in the interest of the public.

METHOD OF STABILIZATION

The problems faced by the bituminous coal industry in the United States after the First World War were almost identical with those faced by the industry in virtually every other major coal producing country. Various countries tried various devices, including nationalization of coal deposits to remedy the economy of their coal industries. In the United States, however, the Congress chose to deal with these problems by balancing cost against realization through institution of minimum prices with the aid of the industry rather than resort to Government-controlled cartels or industry-freezing production or marketing quotas.

To insure producers the largest possible field for initiative compatible with stabilization, the Congress wrote into the Bituminous Coal Act the specific provision that "existing fair competitive opportunities" must be preserved by giving consideration, in fixing minimum prices, to the relative market value of coals, values as to uses, seasonal demand, transportation methods and charges, and competitive relationships between coal and other forms of fuel and energy, and the interests of consumers of coal.

Administration of the act was entrusted originally to the National Bituminous Coal Commission composed of seven members, some of whom represented the industry. Although it was able to perform important work in organizing the task before it, the Commission did not succeed in putting into effect the statutory mechanisms intended to rehabilitate the bituminous coal industry.

ORIGIN OF THE BITUMINOUS COAL DIVISION

Under Reorganization Plan No. II, issued by the President pursuant to the Reorganization Act of 1939, the Commission was abolished and its functions were transferred to the Secretary of the Interior as of July 1, 1939. By an order dated July 1, 1939, the Secretary constituted the Bituminous Coal Division in the Department of the Interior and empowered its Director to exercise, with minor exceptions, the functions of the Commission.

At the outset of its administration of the act, the Division effected extensive changes in organization and procedure; the field offices were consolidated and other economies were made. Pursuant to the pro-

visions of the Ramspeck Act, practically all employees were placed under civil service. Minimum prices and marketing rules and regulations were initially established on October 1, 1940. No court actions were prosecuted and consequently no stays or injunctions were issued by any court against the enforcement of those minimum prices and fair marketing rules. Minimum prices were generally revised October 1, 1942, in order to reflect changes in the costs of production.

BENEFITS TO INDUSTRY MEASURED

Although the fact that the industry enjoyed sufficient economic vigor to be able to meet wartime coal requirements may be regarded as substantial proof that its condition had improved under the operation of the act, the benefits which the act brought the industry are confirmed by more specific evidence.

Prior to the establishment of minimum prices, the costs of producing coal exceeded realization and the whole industry lost money. Despite the growing impetus of wartime industrial activities, this condition remained during the first 9 months of 1940. During these last months in which the industry operated without the protection of minimum prices, the average loss per ton for the industry as a whole was roughly 5 cents. The condition was not showing any progressive improvement. However, coincidental with the establishment of effective minimum prices, all coal has sold on a level sufficient to return to the industry its cost of production as defined in the coal act, and the industry's habitual losses disappeared.

The contrast between conditions in the industry with respect to the relationship of costs and realization before and after establishment of minimum prices is shown in Charts 1 and 2. Chart 1 shows that in 1938 about 80 percent of the commercial tonnage sold at a deficit. The average deficit of all commercial tonnage that year was 15 cents a ton. This amounted to an operating loss for commercial operators of about \$40,000,000. At all periods since the establishment of minimum prices, not less than approximately two-thirds of the industry's commercial tonnage sold at a margin above costs. During most of the time after the establishment of minimum prices, about three-quarters of the industry was operating above costs. In the first 3 months of 1941 there was about 80 percent of the production with a margin above costs. This percentage dropped somewhat with the revision of wages in April 1941, but remained at about 65 percent during the summer months. During October 1941 the industry was making in excess of 15 cents per ton, and 76 percent of the commercial mines were able to make a margin above costs.

COMPARISON OF REALIZATION AND COST¹ FOR COMMERCIAL² BITUMINOUS COAL MINES IN THE UNITED STATES, 1938.

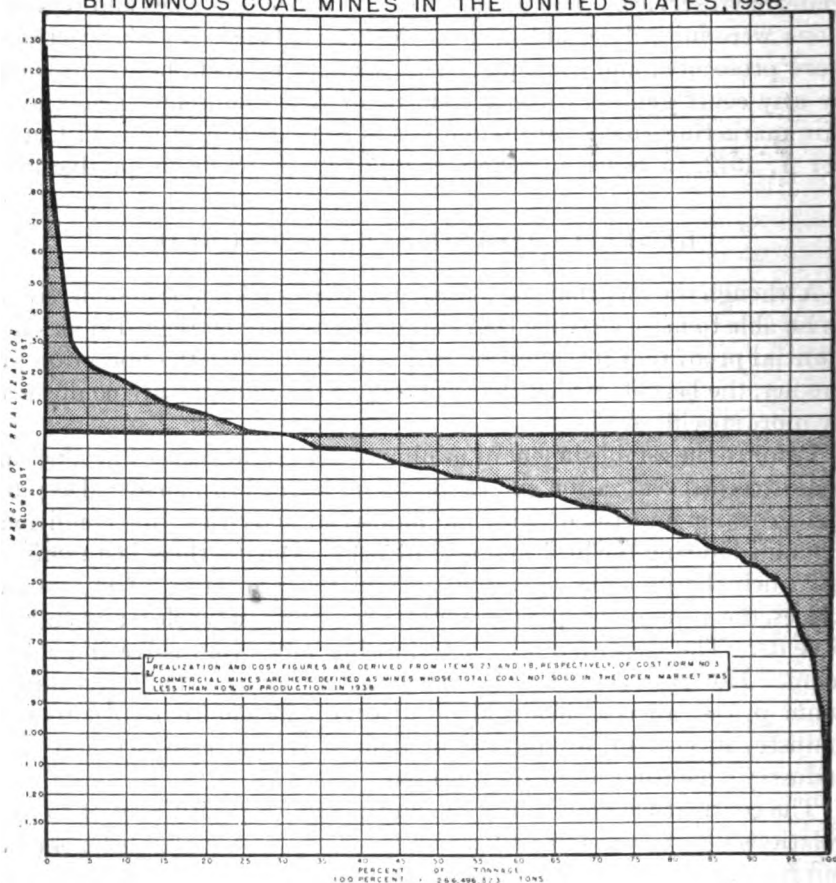

CHART 1

Chart No. 2 for 1942, shows that about three-fourths of the coal mines made a margin above costs. The margin for that year was about 12 cents a ton, a modest return, and for the commercial industry as a whole the operating margin was \$52,200,000, in sharp contrast with the deficit of \$40,000,000 in 1938.

While the establishment of minimum prices was not, perhaps, solely responsible for this changed relationship, clearly much of the improvement in the economic condition of the industry must be credited to the operation of the act. A considerable percentage of coal sold at the minimum price level throughout the year of 1942. In all likelihood this coal would have sold at still lower prices in the absence of the restraints of the statute. This would have wrought a considerable

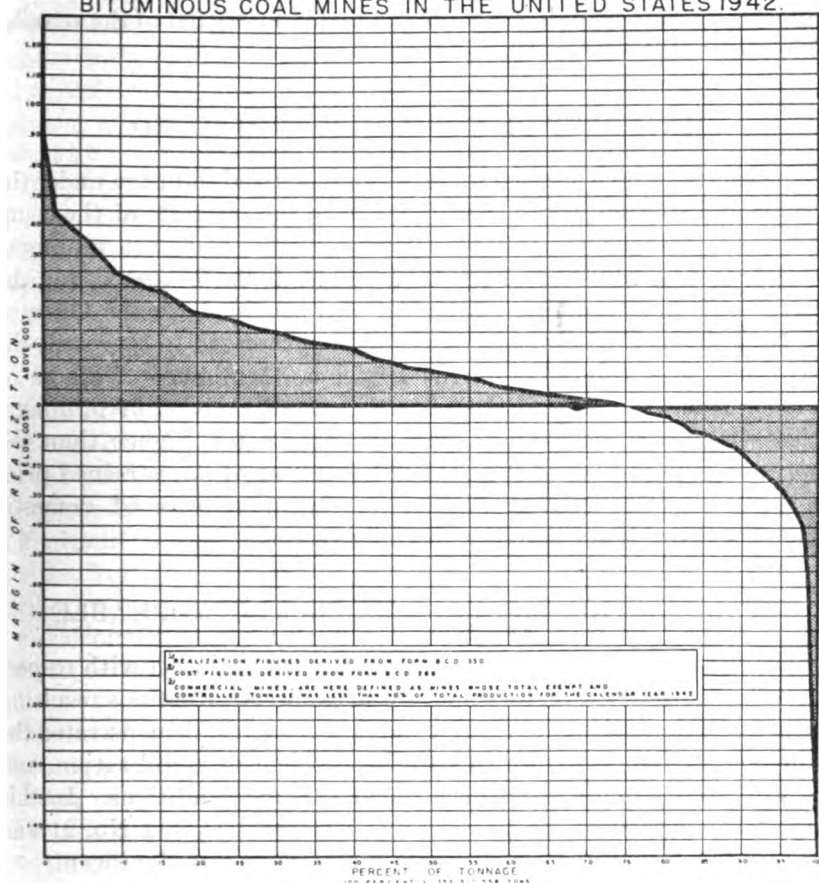

CHART 2

change in the picture presented in Chart 2. It may reasonably be concluded that a much larger segment of the industry would have lost money at a time when the Nation could ill afford to have the industry weakened.

The Bituminous Coal Act also established a structure for the marketing of coal. It provided for the elimination of discriminatory and other unfair trade practices which characterized the industry in the period prior to its enactment. Among these were secret rebates, discounts, attempts to purchase business, the intentional misrepresentation of the quality and kind of coal, misleading and deceptive advertising; the unauthorized use of trademarks, trade names, and slogans of a competitor, the breaching of contracts between a competitor and

his customer, employment of persons primarily for the purpose of procuring preferment with a customer. The act thus played an important part in bringing order to the coal industry out of the anarchy which prevailed a few years ago.

INTEREST OF CONSUMER PROTECTED

The benefits which accrued to the bituminous coal industry under the operation of the act were not prejudicial to the interests of the country's coal consumers. The act specifically directed that minimum prices, when established, must be designed to have regard for the interests of the consuming public. It also provided for the Office of the Bituminous Coal Consumers' Counsel, authorized to represent the coal consuming public before the Division. Minimum prices as of October 1942—the date of the general over-all revision of minimum prices—were, on the average, only 29 cents a ton higher than the depressed going prices of 1939, the last full year of unrestrained price competition. The average increase in the mine price of domestic sizes of coal was lower than the over-all average.

STABILIZATION MECHANISMS PROVED WORKABLE

During the last fiscal year, the administration of the act with respect to routine matters within its scope as well as special situations resulting from the Nation's change-over to a wartime economy, demonstrated the soundness of the act's approach to the problem of stabilization, and the workability of its mechanism under varying conditions. In this respect completion of the proceeding in General Docket No. 21 and the resultant general revision of minimum prices was significant.

Novel and complex economic and legal issues were involved both in the establishment and subsequent revision of a minimum price structure for an industry the marketing of whose products involved the most intricate price relationships. A sound and careful approach demanded that all interested persons be granted an opportunity to present in full their points of view. Lengthy hearings were the natural result. Time lags consequently preceded both the initial establishment and the general revisions of the minimum price structure. Yet it was clear that the objectives of the act could not be achieved unless it were feasible to translate speedily increases or decreases in costs of production into increases or decreases in minimum prices. Techniques were evolved in the course of the proceeding in General Docket No. 21 which assured the expedition of future proceedings looking toward general price revision.

The first phase of this proceeding was concerned with determining the changes in costs from those upon which the original price structure was based. Using 1940 as a base year, the Division made adjustments, over the protest of the Associated Industries of New York State, Inc., to reflect increases in labor costs due to the Appalachian wage agreement effective April 1, 1941. The determination was challenged in court by a petition for review filed by Associated Industries, which remained undecided upon the expiration of the act.

The second phase was concerned with the establishment of a minimum price structure for each minimum price area which would reflect the costs as determined in the first phase. One of the questions involved was whether minimum prices should be revised merely to reflect cost changes since the determination upon which the first price structure was based, or whether they should be revised to bring about approximate equivalence between costs established as current in the first phase of the proceeding. The formula adopted by the Director, over the protest of Associated Industries, and affirmed by the Secretary of the Interior was that in a general price revision proceeding, the minimum price should be increased or decreased so that minimum price realization, estimated upon as current and representative a distribution period as possible, would be at parity with current costs of operation, as nearly as could be ascertained.

Another basic issue was resolved in the second phase of the proceeding. It was discovered that the extent to which minimum prices for coals of each minimum price area had to be increased in order that an approximate equivalence between minimum price realization and costs of operation could be attained varied from minimum price area to minimum price area.

Revising in varying amounts the minimum prices for coal of different minimum price areas would have destroyed the coordination between competing districts, established in the initial price structure to effectuate the provision of the statute that the effective minimum price should preserve so far as possible the fair existing competitive opportunities in the industry.

To resolve this problem, the Director, again over the objection of Associated Industries, and the Bituminous Coal Consumer's Counsel, applied the so-called "weighted average adjustment method" in order to preserve the coordination. Under this method, price adjustments on coal moving into selected groups of consuming market areas were made uniform by the amount of the weighted average increase determined by weighting the realization increases needed by the combined tonnages of the coal sold in selected groups of consuming areas.

By applying these techniques in future general price revision proceedings it would have been possible to have made a general revision of minimum prices generally subject almost to mathematical determination.

ADJUSTMENT OF PRICES FLEXIBLE

As a means of keeping minimum price structures equitable, the Congress wrote into the act the means for quick adjustment of particular minimum prices or coordinations through petition under section 4 II (d). The operation of this provision of the act during the last fiscal year continued to demonstrate that varying interests involved in the production and marketing of bituminous coal can be equitably reconciled in the fixing and enforcement of minimum prices.

A majority of the 531 petitions filed under the section requested the establishment of prices for new coals coming on the market, rather than for revision of established prices. Of the petitions filed from July 1, 1942, through June 30, 1943, all but 68 had been acted upon and disposed of by the latter date.

RAIL-RIVER COORDINATION

One of the most complex tasks of the Division was to assign proper weights to the various factors enumerated in the price-fixing provisions of the act in establishing minimum prices for coals moving into markets served by both river and rail transportation.

The act provides that, in the establishment of minimum prices, "transportation methods and charges and their effect upon a reasonable opportunity to compete on a fair basis" shall be taken into account, and that prices "shall have due regard to the interests of the consuming public," and furthermore that "existing fair competitive opportunities shall be preserved as nearly as possible."

In many instances the cost of shipping coal by river is lower than the cost of shipping by rail, with the result that river-borne coals may have a competitive advantage in certain market areas although many other factors may play a part in determining the ability of producers who must ship by rail to compete against river shipping producers. Thus it becomes apparent that in defining the scope of the price provisions enumerated with respect to competing river and rail coals, the Division had to reconcile a complex of conflicting interests.

If the same price were established for river and rail coal moving into a previously rail-dominated market, river coal would deliver

cheaper and destroy previous competitive opportunities. Accordingly, in the original minimum price structure, in general, differentials in mine prices were established favoring rail coals which had been competing with river coals at a particular market area to the extent necessary to allow the rail coals to be sold at that market at the same delivered prices as river coals of equal value. No such differential was provided for rail coals which had not been competing with river coals. Mine prices for most river-borne coal were equated with mine prices for rail coal so that the minimum delivered price was for river-borne than for coal shipped all-rail.

It was not intended, however, to freeze the competitive situation in each market as it was recognized that any of many factors might encourage a particular consumer, or retailer, in the absence of minimum prices, to purchase river-borne coal rather than rail-borne coal. With this possibility in view, minimum price schedules for districts affected contained "special case machinery" whereby petitions for "free alongside prices" might be addressed to the Division under section 4 II (d). Twenty-one petitions for relief under this machinery were filed and permanent relief was granted in 13 and temporary relief in 3 cases. Disposition of 2 of the 5 remaining cases hinged upon the final disposition of the proceeding in Docket No. A-1239. This case was instituted by the Division to ascertain the merits of complaints by some independent retailers that the coordination of rail and river coals in the Cincinnati, Ohio, marketing area had placed them at a competitive disadvantage. Cincinnati had been found to be a rail-dominated market when the first price structure was established in General Docket No. 15. The record indicated that it was essential to maintain the Cincinnati rail market because lack of continuity of traffic on the Ohio River due to freezing or floods jeopardized a continuous coal supply. At such times when transportation was disrupted serious coal shortages might occur in the Cincinnati area if the rail market were eliminated through preferential treatment of river-borne coal. It was found that the marketing situation in Cincinnati was further complicated by a conflict of interests between independent retailers and the so-called integrated retailers who were part of large organizations engaged in the production and transportation as well as the retailing of coal. After considering all factors involved, the Division had coordinated the mine prices for all-rail coals and river coals moving into the Cincinnati area so as to equate the delivered price of such coals.

However, data obtained in the proceeding in Docket No. A-1239 indicated that a substantial differential existed between the costs of the independent and integrated retail operations in the Cincinnati

area. The record also indicated that a substantial increase had taken place in the volume of coal moving by river into this area.

The report of the Examiner in Docket No. A-1239 issued after the end of the fiscal year, illustrates that the minimum price structure is susceptible of sensitive and equitable adjustment at controversial points.

The examiner recommended, first, that all retail dealers in Cincinnati, whether independent or affiliated with producers, should be permitted to purchase at mine prices for free alongside delivery provided they undertake to resell at prices not below the minimum f. o. b. mine price for all-rail shipment, plus the all-rail freight rate from the origin point to the point of resale. The examiner recommended, second, that machinery be established whereby a rail shipper threatened with loss of any business with a retail dealer, might be permitted to reduce his prices on particular sizes to the extent necessary to afford him an opportunity to compete for business previously enjoyed. Finally the examiner recommended that producers shipping coal by river to the Cincinnati area in facilities owned or controlled by them, and selling it through affiliates at retail, be required to increase on their books their f. o. b. mine realization by the amount representing the difference between the all-rail freight rate between the points of transit and the actual cost to them of transportation reasonably computed. Because of the expiration of the act, time was not available for final disposition of the proceeding.

MARKETING AGENCIES

Section 12 of the act exempted from the prohibitions of the anti-trust laws of the United States marketing agencies disposing of bituminous coal in commerce upon condition that such agencies obtain Division approval and conform with "reasonable regulations for the protection of the public interests" to be prescribed by the Division. The grounds for Division approval were enumerated in the statute. The Division deemed it a crucial responsibility to see that general national policies exemplified in the antitrust laws were not violated by the marketing agencies and that, on the contrary, such agencies were made to subserve the national interest by employing more economical methods of marketing coal.

At the outset of the administration of the act a number of marketing agencies were provisionally approved by the National Bituminous Coal Commission. By 1941 these agencies had become fully organized and were beginning to exercise an appreciable influence on the market. The Division issued orders to the agencies to show cause why

additional restrictions should not be imposed on them in the public interest. During the last fiscal year examiners' reports were submitted in 11 proceedings. The examiners recommend that previous orders which had been issued provisionally approving the agencies involved be modified. Although the additional restrictions varied in detail from agency to agency, the examiners recommended generally that the commissions the agencies received on sales should not exceed 10 percent, that no increases should be effected in the agency list prices without Division approval, that the list prices might be suspended by the Division upon proof of their unreasonableness, and that the agencies should submit appropriate reports. Expiration of the act prevented final disposition of these proceedings.

COMPLIANCE

The magnitude of the task of enforcing compliance may be judged by the fact that the act and implementing regulations issued by the Division applied to some 17,000 companies or individuals as producers, sales agents, or distributors engaged in diverse practices in connection with the production and marketing of coals of a wide variety of kinds, qualities, and sizes. A great preponderance of those engaged in the industry were appreciative of the benefits of these regulations and cooperated in their enforcement. However, the urge to obtain more business prompted a relatively few to resort to practices prohibited by the act. This was true even in times of unprecedented demand such as experienced during the past fiscal year.

Instances of price violations were generally found in connection with the sales of lower grades of coal. Some producers disregarded the over-all benefits of the act to resort to unfair practices to obtain markets for residual sizes. A greater proportion of all violations were simple, most frequently being sales of coal at prices less than the effective minima. However, several cases came to light where elaborate and intricate schemes had been devised for evading price and other regulations. Systematic checking by the compliance staff of the Division disclosed many inadvertent as well as wilful violations. When compliance checks indicated wilful violation, compliance proceedings were instituted either by the Bituminous Coal Producers' Boards or by the Division.

During the fiscal year, 508 such investigations were completed, 88 hearings were held, and 129 orders imposing the penalties under the act, and Rules and Regulations were issued. Of these, 69 directed producers to cease and desist from further violations; 42 revoked the code membership of producers, the restoration of which were condi-

tioned upon payment of taxes ranging from moderate sums up to \$8,500.08, and totaling \$49,803.65; 15 suspended or revoked the registration of distributors, and 3 directed distributors to cease and desist from further violations.

One compliance proceeding during the fiscal year was the second of its kind in the history of the act. In the *Matter of Albuquerque and Cerrillos Coal Co.*, Docket No. 1808-FD, the Director was called upon to make a ruling under the provisions of section 9, which insures that labor practices in the coal industry will be consistent with the national policy relative to collective bargaining established by other statutes. It was found that the Albuquerque and Cerrillos Coal Co., a New Mexico producer, had failed to accord its employees the right to bargain collectively and that it had been guilty of restraining, coercing, and interfering with the free exercise of their collective bargaining rights. The Director thereupon certified his findings to departments or agencies of the United States to which the producer was supplying coal, in accordance with the provisions of section 9, which further provided that such agencies or departments should cancel their contracts for coal with the producer.

LITIGATION

The nature and extent of litigation with respect to the rulings and other administrative actions of the Division during the fiscal year testified to a high degree of acceptance on the part of those concerned. Although a considerable number of punitive orders were issued by the Director because of violations of the act, and a considerable number of orders were issued resolving complicated and delicate issues, only one petition for review of administrative action was filed during the fiscal year in a circuit court of appeals under section 6 (b) of the act. It and all the challenged determinations of the Division which had been reached before the beginning of the past fiscal year were upheld by the courts.

The city of Indianapolis had filed on May 21, 1942, in the Circuit Court of Appeals for the Seventh Circuit, a petition for review of the Director's order, dated April 7, 1942, dismissing its application under section 4 II (1) of the act for exemption of coal produced by a wholly owned subsidiary corporation of West Virginia. The single question raised was whether the Director had correctly found that the petitioner was not the producer of the coal involved. The court, basing its decision upon one by the United States Supreme Court, repudiated one of its former decisions which had reached a contrary result, and upheld the action of the Director, *City of Indianapolis v. Wheeler and*

Ickes, 132 F. (2d) 897 (C. C. A. 7th, 1943). Petition for writ of certiorari was denied by the Supreme Court April 5, 1943.

The Ozark Coal Co. had filed on May 23, 1942, in the Circuit Court of Appeals for the Sixth Circuit, a petition for review of the Director's order, dated March 28, 1942, establishing minimum prices for certain coals produced at the Sunshine Mine in District 14 (Arkansas). The principal questions raised were whether the Director's findings concerning the physical characteristics and market value of the coals involved were supported by substantial evidence, whether the prices were properly established pursuant to the price-fixing provisions of the act, and whether the administrative findings were proper in form. By order, dated May 31, 1943, the court affirmed the action of the Director without opinion. *Ozark Coal Co. v. Wheeler and Ickes*, No. 9275. The time for filing a petition to the Supreme Court for writ of certiorari has not yet expired.

The Binkley Mining Co. of Missouri, filed on July 16, 1942, in the Circuit Court of Appeals for the Eighth Circuit petitions to review two orders of the Director, dated June 4, 1942, directing the petitioner to cease and desist from violations of the Bituminous Coal Code. These cases, involving similar facts, raised the question whether the Division possessed statutory authority to continue a compliance proceeding instituted upon complaint by a district board when the district board subsequently sought to terminate the proceeding. Also involved was the question whether the Director's findings that the petitioner had wilfully violated the code in selling coal at less than the applicable minimum prices which had been established by the Division, were supported by substantial evidence. The court affirmed the Director's action in both cases. *Binkley Mining Co. of Missouri v. Wheeler and Ickes*, 133 F. (2d) 863 (C. C. A. 8th, 1943); *Binkley Mining Co. of Missouri v. Wheeler and Ickes*, 133 F. (2d) 872 (C. C. A. 8th, 1943). The Supreme Court denied petitions for certiorari filed in both cases, June 7, 1943.

OUTLOOK FOR THE BITUMINOUS COAL INDUSTRY

Several bills were introduced during the first session of the Seventy-Eighth Congress to extend the Bituminous Coal Act which was due to expire April 26, 1943. Although the act twice was extended—for a total of 4 months—by congressional resolutions, the Ways and Means Committee of the House of Representatives failed, after a complete hearing, to report any bill providing for extension of the act beyond August 23, 1943. On June 30, during the hearing on H. R. 1454, and other bills to extend the act, H. J. Resolution 145

was introduced. It provided for extension of the act until January 1, 1944. This resolution was reported by the Ways and Means Committee July 1, and the Rules Committee was asked for a rule permitting its consideration by the House. Pending consideration of the Resolution by the Rules Committee, the Ways and Means Committee voted not to report H. R. 1454, and no further action was taken on H. J. Resolution 145.

Testimony offered at the hearing on bills to extend the Bituminous Coal Act was to the effect that it had provided workable mechanisms for stabilizing the industry without injury to the consumer. It was testified that continued stabilization is needed so that the industry can continue to supply an adequate amount of fuel both in time of peace and in time of war.

In any event, the fundamental economic characteristics of the coal industry which led the Congress to consider regulation desirable in the first instance have in no way been modified and will continue during and after the present war. The various factors responsible for these continuing conditions are:

(1) The number of production units in the coal industry ranges between 12,000 and 17,000 scattered over 29 States, selling coal in competition in numerous markets without let or hinderance, yet the four largest commercial companies produce only a little more than 10 percent of the country's commercial tonnage. The situation is then one in which there are a large number of weak sellers confronted with a relatively small number of strong buyers who can demoralize the market by playing one necessitous seller against another, because the operators, being so numerous and having such a diversity of interests, are not able by themselves to bring about a stability between costs and prices in contrast with other industries in which the units are not so numerous or heterogeneous.

(2) There are wide variations in costs and prices, which enables those favored by these conditions to demoralize the market in the competitive pursuit of tonnage.

(3) A further cost characteristic of the coal industry has a marked effect on prices. That is, coal of various sizes is produced at joint costs. In order to produce lump, it is necessary also to produce other sizes. It is not possible to determine accurately what amount of the cost should be borne by each product other than to let the relative demand for the products make such a determination. If one particular size is in demand, the company will concentrate on that size and then sell the other resultant sizes for whatever the market will yield. It is hoped by the company that the total revenue will equal or exceed the total costs. But the entrance onto the market of coal

which must be produced in order for the company to fill its contracts has a demoralizing effect on the market, and may be detrimental to all other companies competing in that market. Much coal is thus sold on the market at prices which are in no way related to costs, and the result under free competition frequently was that total revenue was less than total costs for the industry as a whole.

(4) Certain factors make for an existence at various periods of an overcapacity in the coal industry. Coal production ordinarily is a highly seasonal industry. The industry is built up to produce enough coal at least to supply the market during the peak seasons. During the other seasons there is a great overcapacity in many districts. There is an urge to sell coal to keep the plant going to lessen the burden of overhead costs. During periods of slack production, of either a seasonal or cyclical character, there is a downward pressure on prices.

(5) The fact that the demand for coal is inelastic has much to do with the instability of the industry. That is, a reduction in prices does not encourage coal consumers to consume any appreciably greater amount of coal at any one time. The existence of large stocks has an unusually depressing effect on coal prices, and prices fluctuate violently up and down as the stocks of coal are small or large. The stage is set for price-cutting in a situation in which the total requirement is fixed and in which various producers attempt to save themselves from a small volume of output in dealing with buyers who are indifferent to price as an incentive to use more coal. On the contrary, when there is a reversal of all of these factors, the price of coal soars to levels in no way related to costs.

(6) Certain practices in the sale of coal, sometimes associated with the fact that coal of various sizes is a joint product with coal of other sizes, tend to aggravate the effect of the extreme willingness of sellers to sell at any price obtainable. A car of coal may be listed with several distributors who contact many prospective customers, and each distributor if given the opportunity, may be willing to sell this distressed coal at any price in order to realize a commission. This demoralizes the market out of all proportion to the amount of coal which is being offered at distressed prices.

The result of these economic factors that make for ruinous competition was disastrous. The market price at the mine was set by the delivered price less the freight, and those mines with higher freight rates at greater distance from the market in some cases practically were giving their coal away. The low prices exert a pressure on costs which are largely in the form of wages. Since about 60 percent of the cost of mining is in wages, and since all other elements in the delivered price of coal are more or less rigidly fixed, except certain

overheads which can be ignored a while, there was great pressure directly or indirectly on wages as prices declined. This opened the way for conflict between owners and miners.

But the mine owners were not able to pass on in wage economies all of the burden of the instability of the industry, even though wage rates under free competition in the pre-regulation period sunk to ever lower levels. The ultimate consequence in too many cases was the bankruptcy of mining companies. Contrary to some theoretical doctrines, bankruptcy of mining companies was slow in bringing any relief to the coal industry. Once bankrupt, the capital structure was reorganized, capital charges written off, new money raised in one way or another for working capital, and the new concern proceeded in its desperate course trying in its turn to avoid bankruptcy through a still more desperate process of cutting prices, cutting wages, and wasting the coal resources of the Nation. Thus the process went on without any relief and brought chaos to the industry and the development of unfair trade practices which were patently detrimental not only to the industry itself but detrimental to the orderly course of business and detrimental to consumers. The whole process took no account of the morrow and was violently prejudicial to the interest of the consumers of the near future.

The existence of the present period in which there is a favorable relationship between realization and costs is not unique. Such periods have existed before. In every such instance, however, weakened markets have followed such periods accompanied by a return of chaotic conditions to the coal industry.

In the absence of any statutory control designed to continue stabilization and with markets weakened when the war-expanded demand ceases, it is reasonable to assume that the destructive forces which were eliminated by the Bituminous Coal Act will again become characteristic of the bituminous coal industry.

Petroleum Conservation Division

J. W. STEELE, Acting Director

THE program of the Federal Government to conserve the Nation's deposits of crude oil was inaugurated a little more than a decade ago with the enactment of the NIRA, later held unconstitutional by the Supreme Court. The Connally Act, approved February 22, 1935, was enacted shortly after the demise of the NIRA and contains the same prohibitions with respect to the transportation in interstate commerce of petroleum that were contained in the latter act. With the Nation now in its second year of active participation in World War II, facing what may become a serious shortage of petroleum, the foresight of Congress in enacting this legislation is becoming increasingly apparent.

The Petroleum Conservation Division, established in the Department pursuant to Executive order, has for more than 8 years been devoted to the promotion of conservation of petroleum and to the administration and enforcement of the Connally Act. The act prohibits the transportation in interstate commerce of petroleum and its products produced in excess of amounts permitted under State laws and authorizes the President, or any officer he may designate, to prescribe regulations for enforcement of its provisions. Under this authority, regulations have been promulgated requiring the keeping of books and records by those engaged in producing, transporting, and refining petroleum and providing for the filing by those operators of comprehensive sworn reports of their operations. The report system is designed not only to keep the Division informed as to operations in the industry but also to deter the production of oil in excess of allowables by rendering difficult its undetected disposition. The Supreme Court has held that the falsification of a report required under these regulations is a felony punishable under Section 80, Title 18, United States Code.

OPERATIONS OF FEDERAL PETROLEUM BOARD

Federal Petroleum Board, with headquarters at Kilgore, Tex., in the East Texas Oil Field, and subordinate branch offices at Midland, Houston, and Corpus Christi, Texas and New Orleans, Louisiana received during the fiscal year monthly reports of petroleum production, transportation, and refining operations from the principal oil producing and refining areas of the southwest. The regulations under the act are effective in 106 counties of Texas, in the two principal oil producing counties of New Mexico, and in the entire State of Louisiana, an area containing 726 oil fields producing daily an average of 1,571,000 barrels of crude oil, 77 refineries producing daily an average of 1,200,750 barrels of petroleum products, and 126 gasoline plants producing daily an average of 91,000 barrels of gasoline and liquefied petroleum gases.

The regulations require also that operators of tankers, barges and other vessels shall report to the Washington, D. C., office of the Petroleum Conservation Division, on a prescribed form, all cargoes of petroleum or its products loaded for interstate shipment at any port in Texas, Arkansas, Louisiana, or Mississippi and the discharge of such cargoes if unloaded at any port in the United States. Statistical information from these as well as reports filed with the Federal Petroleum Board is made available regularly to the Petroleum Administration for War.

Enforcement of the act and administration of the regulations in effect thereunder is principally a field operation. Physical inspection of properties and facilities of oil operators is considered necessary to effective enforcement and maintenance of proper control over the interstate movement of petroleum and petroleum products. The Board's activities in this regard have of necessity been curtailed within the past year because of inductions into the armed forces of experienced personnel and reduction in automobile travel to conserve rubber.

Despite reductions in personnel and travel the volume of criminal investigative work has been maintained at a comparatively high level. Eighteen major criminal investigations initiated in the fiscal year together with 6 investigations in progress at the close of the preceding year were disposed of as follows: One case was successfully prosecuted as to 8 of 10 defendants, leaving 2 defendants yet to be tried; 2 cases were closed by action of the Board; 2 cases were closed by United States attorneys; 1 case was closed by the Attorney General. At the close of the year 6 cases were pending with the Department of Justice, 2 were pending on dockets of United States district

courts on indictments returned during the year, 2 cases were complete and in process of transmittal to the Department of Justice and 4 cases were under investigation.

At the beginning of the year 10 criminal cases involving violations of the act were pending with the Department of Justice. Six of the cases were closed without action because of insufficiency or inconclusiveness of the evidence. One case was tried to a jury which returned verdicts of not guilty, and 3 cases in which indictments were returned during the year were pending trial on June 30, 1943.

Four criminal cases were pending in the courts at the beginning of the year. Two of them were successfully prosecuted, one was dismissed on motion of the United States Attorney and one was pending trial on June 30, 1943.

In the three cases successfully prosecuted fines aggregating \$21,500 were assessed and several suspended sentences were imposed.

Bonneville Power Administration

PAUL J. RAVEN, Administrator

I. THE WAR YEAR

COLUMBIA River hydroelectricity, sold directly by the Bonneville Power Administration during the fiscal year 1943, powered the production of enough aluminum to make 70,000 fighter airplanes.

By mid-year, 19 aluminum pot lines had been installed in 5 huge Northwest aluminum reduction plants. At each plant, as construction neared completion, Bonneville had a power supply ready and waiting.

The wisdom of a regional program, premised on the development of Northwest power resources well in advance of need, had, by 1943, proved the greatest single factor in making effective the Nation's light metals production for war.

The \$300,000,000 investment by the people of the United States in the 10-year Bonneville-Grand Coulee enterprise had proved, in the words of Frank J. Taylor, writing in the *Saturday Evening Post*, "as gilt-edged as any war bond, cheap at any price."

WEAPONS FOR WAR

In the fiscal year 1943, power from the Federal system flowed directly into Northwest war plants with a capacity sufficient to produce in one year:

Enough calcium carbide, valued at \$2,400,000, to make approximately 30,000,000 cubic feet of acetylene, sufficient to build 200 Liberty ships.

Enough ferrosilicon, valued at \$1,200,000, to deoxidize 2,500,000 tons of steel, sufficient for 150,000 medium tanks.

Enough additional ferrosilicon, valued at \$1,000,000, to produce 48,000,000 pounds of magnesium metal, worth \$10,000,000, sufficient for 10,000,000 incendiary bombs.

Enough ferrochrome, valued at \$5,000,000, to produce 300,000 tons of armor plate, sufficient to protect 30,000 heavy tanks.

Motive power and electric heat for the production of 208 ships.

Not the least of these contributions to victory was the fact that these basic materials were being produced at the year's end through a minimum use of manpower. The Columbia River offset the drain on man-hours with kilowatt-hours.

POWER POOLED FOR WAR

In addition to direct power service to its own war customers, the Bonneville Administration supplied 11 other utilities systems with net deliveries of 959,617,265 kilowatt-hours during the last 11 months of the fiscal year 1943 under terms of a region-wide power pool agreement.

The autumn months of 1942 saw the lowest stream flow conditions in 54 years of recorded run-off history on all rivers but the Columbia, which has its source in the perpetual ice fields of the Canadian Rockies.

During this period, by consistently overloading the generators at Bonneville and Grand Coulee, the Bonneville Administration was at times able to assume, through pool connections, nearly 50 percent of the entire power load in the States of Oregon and Washington.

But the Bonneville Power Administration's contribution was not confined to the production of weapons and the conservation of manpower. During the fiscal year ending June 30, 1943, the Administration's revenues from the sale of power totaled \$11,265,468.¹

SIX YEARS GROWTH

This record of wartime achievement was established during the Bonneville Administration's sixth year of existence.

In August of 1937 the Administration was created by act of Congress as a provisional agency, set up for the transmission and sale of hydroelectric power generated at Bonneville Dam.

In the annual report for that first fiscal year (ending June 30, 1938), the Bonneville Administrator said:

Modern warfare is fought in the factory as much as in the air or trenches. America must be ready to meet not only peacetime needs of power for home, farm and industry, but must be assured of her ability to cope with emergency demands for large blocks of electricity. In the hydroelectric streams of the Pacific Northwest is potential power far in excess of that available in other regions of the Nation. It should be developed at an economic rate to meet mounting peacetime needs and the equally important possibilities of emergency drains.

Preparedness requires foresight.

¹ Detailed financial reports have been omitted for duration of the war.

The second fiscal year (ending June 30, 1939) saw the launching of a basic construction program which involved the design and initial construction of the agency's huge network of high-voltage transmission lines.

In the third fiscal year (ending June 30, 1940), the agency's power sales program was begun and by the close of that year 188,415,933 kilowatt-hours of electricity had been sold.

In the fourth fiscal year (ending June 30, 1941), Bonneville, by virtue of its substantial volume of power sales, assumed major status as an operating utilities enterprise. It was during this year that Bonneville became a dominant force in the Northwest's preparedness program. As the year closed, 265,000 kilowatts of demand were under contract to six first-line defense industries.

In the fifth fiscal year (ending June 30, 1942), power contracts had risen to approximately 500,000 kilowatts.

II. POWER SALES FISCAL YEAR 1943

* Thirty-five power contracts involving new power sales were executed by the Administration during the fiscal year.

Of these, 20 contracts were with new customers and embraced an over-all contract demand of 203,450 kilowatts. The remaining 15 represented revisions or amendments or supplemental agreements with existing customers for additional power.

Contract demand for all 35 contracts totaled 398,145 kilowatts. Of this total, 363,200 kilowatts represented industrial sales; 15,160 kilowatts, sales to military establishments; 1,100 kilowatts, sales to cooperatives; 18,285 kilowatts, sales to public or peoples' utilities districts; 200 kilowatts, sales to municipalities; and 200 kilowatts, sales to privately owned utilities companies.

By June 30, 1943, the Administration had in effect 85 executed power and interchange contracts, with a total over-all contract demand of 910,752 kilowatts.

On a contract demand basis, these sales were divided as follows:

Industrial sales 806,200 kilowatts; military establishments 21,200 kilowatts; cooperatives 8,060 kilowatts; public or peoples' utilities districts 45,900 kilowatts; municipalities 5,725 kilowatts; and privately owned utilities companies 23,667 kilowatts.

The 1943 revenues of \$11,265,468 more than doubled the 1942 total of \$5,162,376, and brought the total revenues collected by this Administration since its inception to \$18,719,753.

THE WAR MARKET

The Administration's war power market involved principally two types of customer: industrial purchasers and military establishments.

Principal sales in this category, during the year, were the six contracts executed with Defense Plant Corporation establishments, involving 332,000 kilowatts of contract demand. Most of this power was for aluminum reduction and fabrication. Another 32,000 kilowatts of contract demand was divided among six other customers. Of these, the principal purchaser was a third large shipyard in the lower Columbia River district, with a demand for 12,000 kilowatts. Of the 11 military establishments to execute power contracts during the fiscal year, four were Navy Department installations and seven were army installations. Although these military establishments were widely scattered throughout the entire Northwest area, the wide range of the Administration's already constructed transmission facilities made it possible to render prompt service with relatively small difficulty.

New industrial and military sales fiscal year 1943¹

	Contract demand in kilowatts	Date executed
DPC-Spokane Aluminum Reduction Plant	130,000	Feb. 9, 1943
DPC-Spokane Aluminum Rolling Mill	50,000	Nov. 25, 1942

Pacific Carbide & Alloys Co. (Portland)	400	Aug. 1, 1942
Pacific Carbide & Alloys Co. (Tacoma)	6,000	Feb. 25, 1943
Reynolds Metals Co.	⁴ 4,000	Nov. 18, 1942
Do	⁵ 1,200	Jan. 23, 1942
Do	⁵ 2,000	
11 military establishments	15,100	
Total	378,300	

¹ Includes direct sales only. Excludes sales and deliveries to public and private utilities for war purposes.

² Temporary construction power.

³ Short-term overload power.

⁴ Covered 4,000 kilowatts.

⁵ This amendment to be executed as of June 1, 1943, increased to 6,000 kilowatts the contract demand under preceding footnote.

THE PUBLIC POWER MARKET

Seven new contracts negotiated with public-owned power agencies and cooperatives during the fiscal year comprised a total demand value of 19,585 kilowatts.

Of these, one contract was signed by a municipality, three were signed by utilities districts, and three by cooperatives. They brought

the total of "public agency" contracts in force to 52 by the end of the year exclusive of those contracts executed with federally owned agencies.

The cumulative list follows:

Contracts with public agencies as of June 30, 1943

¹ This public utility district is currently operating but is not at present served by BPA.

² No contract demand specified.

³ This public utility district is currently operating but presently has only an emergency service connection with BPA.

⁴ This public utility district is not yet in operation.

⁵ Served via WWP Co.

⁶ Served (at Condit point of delivery) via PP&L Co.

⁷ Total of 3 points of delivery, only 1 of which is energized or constructed, viz.: Condit, 100 kilowatts; North Dalles, 125 kilowatts; Goldendale, 350 kilowatts.

⁸ Served via PP&L Co. at White Salmon River point of delivery, but directly by BPA at North Bonneville and Bonneville Dam delivery points.

⁹ Served via PGE Co.

¹⁰ Served via COP Co.

¹¹ Interchange.

¹² Served via PP&L Co.

¹³ Not energized; completion of line to connect with Eugene substation deferred for duration.

PROGRESS OF PUBLICLY-OWNED AGENCIES

The progress of the Northwest's publicly owned and operated power distribution agencies which purchased all or part of their requirements from the Bonneville Administration was reflected during fiscal 1943 in the increased volume of these purchases. During the year Bonneville power sales to such agencies practically doubled, rising from a total of 89,454,000 kilowatt-hours in fiscal 1942 to 176,723,000 kilowatt-hours.

Of this total, Bonneville's sales to municipalities rose from 22,212,000 in 1942 to 25,737,000 in 1943, while the revenue received increased from \$98,463 to \$99,952. Sales to public utility districts rose from 62,918,000 kilowatt-hours in 1942 to 123,519,000 kilowatt-hours in 1943, while the revenue received rose from \$159,194 to \$364,546. Sales to cooperatives rose from 4,324,000 kilowatt-hours in 1942 to 27,467,000, an increase of 500 percent, in 1943, and the revenues received rose from \$20,526 to \$123,142.

Public power distribution agencies showed steady gains throughout the year in operating revenue, and many showed continued reductions in retail power rates to consumers. A number accumulated substantial surplus funds and, pending further reductions in rates, applied these moneys to the purchase of war bonds.

Several public agencies went into operation during the year. Of these, particularly notable were the Central Lincoln Public Utility District and the Clatskanie Public Utility District, both in the State of Oregon. The latter agency succeeded in selling its revenue bonds at the remarkably low interest rate of 2.8 percent.

Following are typical case histories of public power distribution agencies in the Pacific Northwest.

Cowlitz County Public Utility District No. 1, one of the larger districts in the State of Washington, acquired its properties in November 1940 at \$6,800,000. For the year ending December 31, 1942, it showed a net surplus of \$112,575.06 and an accumulated surplus of \$405,669.99 for amortization after paying all costs of operation, interest, depreciation, and taxes.

During the year ending June 30, 1943, the district reduced the rates or "revenue per kilowatt-hour" from 2 to 1.8 cents. This reduction, together with previous reductions, effected annual savings over rates previously charged by privately owned companies amounting to \$9.60 or 21 percent to customers using 100 kilowatt-hours per month and \$123.60 to those using 750 kilowatt-hours (6 kw.) per month.

Pacific County Public Utility District No. 2 for the year ending December 31, 1942, increased its power requirements from 10,345,680 kilowatt-hours to 11,676,936 for the year, and its annual operating revenues from \$222,273.31 to \$237,479.61 or 6.84 percent. Total operating expenses for the same period had increased 5.14 percent, allowing a net operating income of \$61,050.95, an increase of 7.20 percent over the previous year and a net to surplus of \$52,904.69. Total annual reductions under present rates compared to those previously charged by private companies were estimated at \$51,121 or 25 percent.

Monmouth municipal system by March 31, 1943, had increased its sales by 467,009 kilowatt-hours over the previous year, or 47.2 percent; had reduced its rates or "revenue per kilowatt-hour," from an average of 1.649 to 1.368 cents, thus effecting an annual saving over former rates of \$13.20 or 31 percent to customers using 100 kilowatt-hours per month, and \$147 or 45 percent to those using 75 kilowatt-hours per month.

The city met all operating costs including interest, bond payments and taxes of \$13,311.60, and earned a surplus of \$1,734.13 in 1943 and \$8,170.81 in 1942, or a total surplus to date of \$9,904.94 which is \$4,995.44 in excess of the total debt charges, or 24.84 percent of gross revenue.

Forest Grove municipal system increased its total number of customers for the 12 months ending March 31, 1943, from 1,294 to 1,349, a gain of 55. Its kilowatt-hour sales for the period increased from 2,910,297 to 3,490,245 or 19.93 percent; its operating revenues from \$51,256.95 to \$56,797.96 or 10.81 percent. Operating income increased 23.27 percent. The city reduced the operating revenue received per kilowatt-hour from 1.749 to 1.61 cents during the period. This, added to previous reductions, resulted in an annual saving of \$13.68 over former rates to customers using 100 kilowatt-hours per month or 31 percent, and \$258 or 61 percent to those using 750 kilowatt-hours (6 kw.) per month.

The system paid all operating costs including city taxes of \$4,800, interest of \$7,500 and depreciation, leaving a net income of \$16,095.53. An amount equal to \$7,500 of deferred maintenance was set aside for post-war purposes. A building fund of \$12,000 was established.

McMinnville municipal system increased its total number of customers in the year ending March 31, 1943, from 2,362 to 2,406, a gain of 44; increased its total generated and purchased power from 10,435,552 kilowatt-hours to 11,223,971. The city reduced rates during the year from an average operating revenue per kilowatt-hour of 1.439 to 1.298 cents, effecting an annual saving of \$8.40 or 22 percent to

PROGRESS OF PUBLICLY-OWNED AGENCIES

The progress of the Northwest's publicly owned and operated power distribution agencies which purchased all or part of their requirements from the Bonneville Administration was reflected during fiscal 1943 in the increased volume of these purchases. During the year Bonneville power sales to such agencies practically doubled, rising from a total of 89,454,000 kilowatt-hours in fiscal 1942 to 176,723,000 kilowatt-hours.

Of this total, Bonneville's sales to municipalities rose from 22,212,000 in 1942 to 25,737,000 in 1943, while the revenue received increased from \$98,463 to \$99,952. Sales to public utility districts rose from 62,918,000 kilowatt-hours in 1942 to 123,519,000 kilowatt-hours in 1943, while the revenue received rose from \$159,194 to \$364,546. Sales to cooperatives rose from 4,324,000 kilowatt-hours in 1942 to 27,467,000, an increase of 500 percent, in 1943, and the revenues received rose from \$20,526 to \$123,142.

Public power distribution agencies showed steady gains throughout the year in operating revenue, and many showed continued reductions in retail power rates to consumers. A number accumulated substantial surplus funds and, pending further reductions in rates, applied these moneys to the purchase of war bonds.

Several public agencies went into operation during the year. Of these, particularly notable were the Central Lincoln Public Utility District and the Clatskanie Public Utility District, both in the State of Oregon. The latter agency succeeded in selling its revenue bonds at the remarkably low interest rate of 2.8 percent.

Following are typical case histories of public power distribution agencies in the Pacific Northwest.

Cowlitz County Public Utility District No. 1, one of the larger districts in the State of Washington, acquired its properties in November 1940 at \$6,800,000. For the year ending December 31, 1942, it showed a net surplus of \$112,575.06 and an accumulated surplus of \$405,669.99 for amortization after paying all costs of operation, interest, depreciation, and taxes.

During the year ending June 30, 1943, the district reduced the rates or "revenue per kilowatt-hour" from 2 to 1.8 cents. This reduction, together with previous reductions, effected annual savings over rates previously charged by privately owned companies amounting to \$9.60 or 21 percent to customers using 100 kilowatt-hours per month and \$123.60 to those using 750 kilowatt-hours (6 kw.) per month.

Pacific County Public Utility District No. 2 for the year ending December 31, 1942, increased its power requirements from 10,345,680 kilowatt-hours to 11,676,936 for the year, and its annual operating revenues from \$222,273.31 to \$237,479.61 or 6.84 percent. Total operating expenses for the same period had increased 5.14 percent, allowing a net operating income of \$61,050.95, an increase of 7.20 percent over the previous year and a net to surplus of \$52,904.69. Total annual reductions under present rates compared to those previously charged by private companies were estimated at \$51,121 or 25 percent.

Monmouth municipal system by March 31, 1943, had increased its sales by 467,009 kilowatt-hours over the previous year, or 47.2 percent; had reduced its rates or "revenue per kilowatt-hour," from an average of 1.649 to 1.368 cents, thus effecting an annual saving over former rates of \$13.20 or 31 percent to customers using 100 kilowatt-hours per month, and \$147 or 45 percent to those using 75 kilowatt-hours per month.

The city met all operating costs including interest, bond payments and taxes of \$13,311.60, and earned a surplus of \$1,734.13 in 1943 and \$8,170.81 in 1942, or a total surplus to date of \$9,904.94 which is \$4,995.44 in excess of the total debt charges, or 24.84 percent of gross revenue.

The city reduced rates during the year from an average operating revenue per kilowatt-hour of 1.439 to 1.298 cents, effecting an annual saving of \$8.40 or 22 percent to

PROGRESS OF PUBLICLY-OWNED AGENCIES

The progress of the Northwest's publicly owned and operated power distribution agencies which purchased all or part of their requirements from the Bonneville Administration was reflected during fiscal 1943 in the increased volume of these purchases. During the year Bonneville power sales to such agencies practically doubled, rising from a total of 89,454,000 kilowatt-hours in fiscal 1942 to 176,723,000 kilowatt-hours.

Of this total, Bonneville's sales to municipalities rose from 22,212,000 in 1942 to 25,737,000 in 1943, while the revenue received increased from \$98,463 to \$99,952. Sales to public utility districts rose from 62,918,000 kilowatt-hours in 1942 to 123,519,000 kilowatt-hours in 1943, while the revenue received rose from \$159,194 to \$364,546. Sales to cooperatives rose from 4,324,000 kilowatt-hours in 1942 to 27,467,000, an increase of 500 percent, in 1943, and the revenues received rose from \$20,526 to \$123,142.

Public power distribution agencies showed steady gains throughout the year in operating revenue, and many showed continued reductions in retail power rates to consumers. A number accumulated substantial surplus funds and, pending further reductions in rates, applied these moneys to the purchase of war bonds.

Several public agencies went into operation during the year. Of these, particularly notable were the Central Lincoln Public Utility District and the Clatskanie Public Utility District, both in the State of Oregon. The latter agency succeeded in selling its revenue bonds at the remarkably low interest rate of 2.8 percent.

Following are typical case histories of public power distribution agencies in the Pacific Northwest.

Cowlitz County Public Utility District No. 1, one of the larger districts in the State of Washington, acquired its properties in November 1940 at \$6,800,000. For the year ending December 31, 1942, it showed a net surplus of \$112,575.06 and an accumulated surplus of \$405,669.99 for amortization after paying all costs of operation, interest, depreciation, and taxes.

During the year ending June 30, 1943, the district reduced the rates or "revenue per kilowatt-hour" from 2 to 1.8 cents. This reduction, together with previous reductions, effected annual savings over rates previously charged by privately owned companies amounting to \$9.60 or 21 percent to customers using 100 kilowatt-hours per month and \$123.60 to those using 750 kilowatt-hours (6 kw.) per month.

Pacific County Public Utility District No. 2 for the year ending December 31, 1942, increased its power requirements from 10,345,680 kilowatt-hours to 11,676,936 for the year, and its annual operating revenues from \$222,273.31 to \$237,479.61 or 6.84 percent. Total operating expenses for the same period had increased 5.14 percent, allowing a net operating income of \$61,050.95, an increase of 7.20 percent over the previous year and a net to surplus of \$52,904.69. Total annual reductions under present rates compared to those previously charged by private companies were estimated at \$51,121 or 25 percent.

Monmouth municipal system by March 31, 1943, had increased its sales by 467,009 kilowatt-hours over the previous year, or 47.2 percent; had reduced its rates or "revenue per kilowatt-hour," from an average of 1.649 to 1.368 cents, thus effecting an annual saving over former rates of \$13.20 or 31 percent to customers using 100 kilowatt-hours per month, and \$147 or 45 percent to those using 75 kilowatt-hours per month.

The city met all operating costs including interest, bond payments and taxes of \$13,311.60, and earned a surplus of \$1,734.13 in 1943 and \$8,170.81 in 1942, or a total surplus to date of \$9,904.94 which is \$4,995.44 in excess of the total debt charges, or 24.84 percent of gross revenue.

Forest Grove municipal system increased its total number of customers for the 12 months ending March 31, 1943, from 1,294 to 1,349, a gain of 55. Its kilowatt-hour sales for the period increased from 2,910,297 to 3,490,245 or 19.93 percent; its operating revenues from \$51,256.95 to \$56,797.96 or 10.81 percent. Operating income increased 23.27 percent. The city reduced the operating revenue received per kilowatt-hour from 1.749 to 1.61 cents during the period. This, added to previous reductions, resulted in an annual saving of \$13.68 over former rates to customers using 100 kilowatt-hours per month or 31 percent, and \$258 or 61 percent to those using 750 kilowatt-hours (6 kw.) per month.

The system paid all operating costs including city taxes of \$4,800, interest of \$7,500 and depreciation, leaving a net income of \$16,095.53. An amount equal to \$7,500 of deferred maintenance was set aside for post-war purposes. A building fund of \$12,000 was established.

McMinnville municipal system increased its total number of customers in the year ending March 31, 1943, from 2,362 to 2,406, a gain of 44; increased its total generated and purchased power from 10,435,552 kilowatt-hours to 11,223,971. The city reduced rates during the year from an average operating revenue per kilowatt-hour of 1.439 to 1.298 cents, effecting an annual saving of \$8.40 or 22 percent to

domestic customers using 100 kilowatt-hours per month, and \$147 or 47 percent for such customers using 750 kilowatt-hours (6 kw.) per month.

Meanwhile the system met all operation and depreciation costs, paid \$26,400 interest to the city, paid \$3,925.79 taxes and had a net income for the period of \$19,272.64. Total earned surplus, accumulated since the beginning of Bonneville Power Administration service, was \$40,893.40.

The Inland Empire Cooperative, Inc., operating in eastern Washington, one of the largest in the United States, began operation in 1938 but did not begin using Bonneville power until August 1942. Securing Bonneville power at once reduced the cooperative's annual wholesale power cost by \$32,851. This in turn effected annual savings of \$12 or 16 percent to retail customers using 100 kilowatt-hours per month, and \$78 or 25 percent to those using 750 kilowatt-hours per month.

By the end of 1943 the cooperative had 2,010 miles of energized lines and 3,293 consumers. Its operating revenues for the year were \$193,833.44; expenses were \$155,333.86.

OTHER SALES

By June 30, 1943, three power contracts with private utilities companies were operative. Deliveries had been continued through the year to the Portland General Electric Co. on a day-to-day extension of the terms of the contract first executed in December 1939. Efforts to negotiate a long-term contract with the company were not successful due largely to the fact that the parent company, which owns all of Portland General Electric Co.'s common stock is in reorganization and negotiations had to be conducted with a number of parties who had diverse interests in that reorganization. Agreement could not be reached with all of these diverse interests on terms which would comply with the Bonneville Act and adequately protect the Federal Government's interest. This inability to agree on a long-term power contract resulted in the filing of two lawsuits against the Administrator. The purposes of these suits were to determine the terms under which the Administrator may enter into long-term power contracts with privately owned utilities. The Administrator, however, has continued to serve the growing demands of this company's system on a day-to-day basis because of the shortage of generating capacity in the Portland area.

As the fiscal year closed, the Bonneville Administration was furnishing the operating company approximately 70,000 kilowatts of monthly billing demand—about one-third of its total power requirements.

Other power sales contracts with utility companies at year's end were in force with the Pacific Power & Light Co., with a delivery point at Astoria, Oreg., for a demand of 2,000 kilowatts; and an interchange contract with the Washington Water Power Co. and the Pacific Power & Light Co., which included transfer service to public-owned distribution agencies under contract to the Bonneville Administration.

In addition to its sales contracts, the administration had in force a large number of pole contact and miscellaneous amendatory agreements. Contract actions of all types during the fiscal year totaled 125 items, as follows:

Summary of contract actions fiscal year 1943

<i>Type of Item</i>	<i>Number of Items</i>
Strictly new customers.....	20
Amendments or new agreements with existing customers for additional power.....	13
Revisions to apply revised wholesale rate schedules.....	12
Pole contact agreements, including amendments and supplements thereto.....	5
Miscellaneous amendatory agreements.....	25
Miscellaneous agreements.....	29
Supplemental agreements in regard to transfer service for Bonneville's account under the interchange contract of April 1, 1942, with The Washington Water Power Co. and Pacific Power & Light Co.....	21
Total.....	125

III. FUTURE POWER SALES

On June 30, 1943, 11 contracts involving an over-all minimum demand of 237,000 kilowatts and a possible maximum demand of 312,000 kilowatts were in active negotiation. Individually, these sales prospects ranged from 2,000 to 120,000 kilowatts of demand. They included the new electro-development laboratory and the new alumina reduction plant approved during the fiscal year 1943, as well as a number of new war industries, military establishments and several utilities systems. It was anticipated execution of these contracts during the fiscal year 1944 would bring total contract demands on the Bonneville-Grand Coulee system to nearly 1,300,000 kilowatts, with actual monthly billing demands probably running well in excess of that figure at times.

MARKET DEVELOPMENT SHOWS RESULTS

Industrial progress of the Pacific Northwest region clearly stated, during the fiscal year 1943, the importance of a strong market development program; and as the year drew to a close, it became increasingly apparent that this phase of the Board of Economic Warfare Administration's activities had materially assisted not only in the development of the region's war industry but in providing a foundation for future industrial expansion.

Strenuous efforts were made toward stabilizing the troubled aluminum manufacturing industry. Of the six huge Northwest aluminum plants, four were built by the Defense Plant Corporation and operated under lease as war plants. In order to safeguard the continued operation of such industries as permanent enterprises, the Administration's Market Development staff concentrated its efforts on the establishment of a plant for the manufacture of aluminum oxide from local Northwest clays.

As the fiscal year drew to a close, agencies of the War Production Board and the Bureau of Mines approved the establishment of an aluminum oxide plant in the Pacific Northwest. This plant, with a production capacity, will be constructed and operated in its initial stages by the Chemical Construction Co., an affiliate of the Canadian Cyanamid. Plans for this plant, as approved by the interested agencies, require that it be operated ultimately by the Columbia Metals Co., owned and financed by a group of Northwest businessmen.

During the year the Administration was also able to be of assistance to the Bureau of Mines in the establishment of an industrial development laboratory in the region. This laboratory, under construction as the year closed, was to investigate the feasibility of using the many large deposits of Northwest minerals through the application of low-cost electric power.

In addition to this work, the Administration's Market Development staff continued to cooperate with chambers of commerce and other public and semipublic agencies of the region in the development of community industrial surveys. More than 20 such surveys were completed during the fiscal year. Results were published by the Administration with the inclusion of complete information on available industrial plant sites, raw material and labor supply, transportation and housing facilities and other pertinent factors.

These reports were made available to a large number of interested organizations, for the purpose of encouraging them to con-

Pacific Northwest as a suitable region for the expansion of their enterprises.

All these activities brought substantial recognition of the program's value from a number of industrial sources. Typical was the comment of the industrial publication *The Iron Age*, which, in its issue of May 20, 1943, stated:

. . . The Bonneville-Coulee Power Administration in its business development and industrial analysis departments has now become a general agency and factor in the industrial life and future of the Pacific Northwest which is not only primary but which has become constantly more constructive and beneficial.

THE POST-WAR POWER MARKET

As the United Nations gained victory after victory during 1943, it became necessary, in the interest of good management, for the Bonneville Administration to consider the effects of the post-war period upon its power market. Furthermore, this was required by a Presidential memorandum on May 22, 1943.

The post-war problem, as it directly affected Bonneville, was twofold: (1) the stabilization and expansion of power-using industry; and (2) the development of the rural and domestic use of low-cost electric power.

Accordingly, it was toward the solution of this dual problem that the Bonneville Administration began to shape a post-war program, to be undertaken as soon as possible, for the approval of the Congress, the Department of the Interior and the War Production Board.

Stabilization of the immense Northwest aluminum industry comprised one of the largest single phases of the problem. In order to determine what steps were necessary to this stabilization, consideration was given to a study of the competitive position of existing aluminum plants, an analysis of the Defense Plant Corporation contracts for each of the plants, and finally, to the active promotion of steps to provide continuing operations on a competitive basis, by businessmen of the region.

With this proposal, consideration was given to methods whereby post-war aluminum markets could be developed in and accessible to the Northwest region.

Along with this, the possibilities of assisting in further research relative to other power-using industries were being considered.

Active consideration also was being given to plans for expansion of the rural and domestic power market. Rough estimates arrived at during the fiscal year indicated that, with proper development, irri-

gation, rural electrification and domestic power use would require, during the first post-war decade, an additional generating capacity in the Pacific Northwest of about 1,700,000 kilowatts.

All these aspects of the post-war problem as it would affect the Northwest power market were being pulled together for consideration by the proper Government bureaus and the Congress during the fiscal year 1944. Such studies were considered not only to be fundamental to the proper administration of the Bonneville Act, but of considerable importance to future protection of the Pacific Northwest economy.

IV. GROWTH AND OPERATION OF THE SYSTEM

At the beginning of fiscal 1943 the Administration had on hand a total of \$55,365,170 in unexpended congressional appropriations. This sum included the 1943 appropriation of \$20,007,000 for facilities required for war power deliveries, a carry-over from former fiscal years of \$26,000,000 which were being maintained as a reserve for projects authorized prior to the war but which could not be built during the critical material shortage, and approximately \$8,700,000 which had been allocated to specific projects then under construction.

On October 20, 1942, the chairman of the War Production Board halted all nonmilitary construction projects generally throughout the United States, pending review by a special Facilities Review Committee to determine which could be postponed as least essential to the war program.

On November 17, 1942, the Bonneville Administrator was ordered by the Facilities Review Committee to continue the agency's 1943 construction program to completion. The committee's findings showed that without exception the 23 major construction projects reviewed, as well as a number of smaller, related projects, were all of first importance to the Northwest's war production program.

POWER SYSTEM EXTENDED

In accordance with this approval, the Administration completed and energized 695 circuit miles of transmission line during fiscal 1943, of which 495.6 circuit miles were of 230 kilovolt construction. The Bonneville system's power substations were increased in number from 37 to 51 during the same period. Substation transformer capacity was increased by 733,667 kilovolt-amperes—a substantial gain over the 530,050 kilovolt-amperes of substation capacity installed during the previous fiscal year.

By June 30, 1943, the Administration had in operation a total of 2,443 circuit miles of transmission lines and a total substation transformer capacity of 2,049,579 kilovolt-amperes.

OPERATIONS

All facilities of the entire system were taxed to their utmost throughout the year. During the fall months of calendar year 1942, the unprecedented drought conditions on all Northwest power streams, with the single exception of the Columbia River, made it necessary for Bonneville to operate without adequate reserves of generating or transmission capacity. At times the generators at Grand Coulee and Bonneville were overloaded well in excess of 10 percent as an emergency measure. Following the extreme low-water period in the fall months of 1942, added demands by war industry throughout the Northwest made it necessary to continue overload conditions much of the time.

THE NORTHWEST POWER POOL

The principal emergency operations measure undertaken during the year was the development of the Northwest power pool in cooperation with 10 other major utilities serving the entire Pacific Northwest region. Prior to the beginning of the fiscal year 1943, the Bonneville Administration's system was already interconnected with several major utilities systems. In order to forestall the development of area-wide power shortages within the region and to make available at all times maximum power for war production within six Northwest States, arrangements for interconnections with six other major utilities systems were completed, with the concurrence and sponsorship of the War Production Board, in April of 1942. Later the War Production Board endorsed and made mandatory such interconnection programs by its Limitations Order L-94, issued May 1, 1942.

Actual operations of the Northwest power pool began August 1, 1942—one month after the beginning of the fiscal year. During the 11-month period between August 1, 1942, and June 30, 1943, the Bonneville Power Administration made total energy deliveries to other pool members of 1,365,911,630 kilowatt-hours.

During this same period, energy received by the Bonneville Administration from other pool members totaled 406,294,365 kilowatt-hours. This made the Government's net contribution to the Northwest power pool 959,617,265 kilowatt-hours during the 11-month period.

Thus, in addition to direct power deliveries to Bonneville's own war customers, the two Federal dams on the Columbia River contributed

nearly 1 billion kilowatt-hours to fill the wartime needs of other utility systems.

THE POWER-SUPPLY PROBLEM

On June 30, 1943, combined installed rated generating capacity at the Bonneville and Grand Coulee plants totaled 884,400 kilowatts. Additional units totaling 432,000 kilowatts were undergoing construction and installation. Completion of these latter units was scheduled to increase combined rated capacity at both plants to 1,316,400 kilowatts by the spring of calendar year 1944. In addition, U. S. Army engineers were engaged in raising the pool elevation behind Bonneville Dam for the purpose of adding 29,000 kilowatts of prime power capacity to the over-all system total.

Estimates by Bonneville engineers in the spring of 1943 indicated that in the 12 months immediately following final installation of this capacity, the total average load on the Bonneville system would rise as high as 1,038,400 kilowatts, of which 97 percent would comprise deliveries to war industries and military establishments. It was estimated that during the same period the loads for the interconnected utilities systems, excluding the Bonneville-Grand Coulee system, might exceed the dependable generating capacity of these other systems by 100,000 to 200,000 kilowatts if the year proved to be one of low water. In such event, the Bonneville-Grand Coulee system would have to supply the deficiency.

These and other pertinent factors were presented to the Bonneville Advisory Board at a meeting in Washington, D. C., on March 12-13, 1943.

In its consideration of these matters, the Advisory Board came to the conclusion that, if the war continued, there was some danger of a region-wide power shortage in the winter of 1944 and almost certain danger of such a shortage in the winter of 1945 and thereafter.

Accordingly, at its March 12-13 meeting, the Advisory Board recommended the following program:

(1) Rapid completion of generating units already under construction at both dams.

(2) Rapid completion of the City of Seattle's Ross Dam and the 35,000-kilowatt unit at the city of Tacoma's Nisqually project.

(3) Increase in the level of the Bonneville pool.¹

(4) Reinstatement immediately, with adequate priorities, of generator No. 7 at Grand Coulee for service in 1944, if possible.

(5) Arrangement for completion of Rock Island project.

¹ This had already been undertaken by the U. S. Army engineers.

(6) Investigation of the possibility of developing not less than 3 million acre-feet of water storage on the Clark Fork of the Columbia River.

(7) Reinstatement, with adequate priorities, of generating units 8 and 9 to be installed at Grand Coulee Dam by 1945.

(8) Action to insure immediate construction of substantial additional power supply for 1946 and subsequent years by construction of the Umatilla project.

Upon presentation of these recommendations, the War Production Board concurred in a number of them, including the proposal to investigate the possibilities of storage projects in the Clark Fork watershed. As the fiscal year closed, the Clark Fork investigations were in an advanced stage; and on June 28, 1943, the War Production Board approved the construction and installation of Grand Coulee generating unit No. 7.

Depending upon successful conclusion of these negotiations for upstream storage and completion of Coulee Generator No. 7, the Administration anticipated any power shortage developing in 1945 could be adequately met.

POST-WAR CONSTRUCTION PROGRAM

On May 22, 1943, in a memorandum to the heads of all departments and agencies, the President of the United States requested the submittal of detailed construction plans for public works which had been deferred because of the war, along with proposed supplemental appropriations required for effectuating such plans and suggestions as to additional legislation which might be required to implement them.

In accordance with this order, the Bonneville Administration began work on a detailed post-war construction program. As the year closed, initial estimates indicated the Administration would be prepared, on demobilization day, to call for bids on \$26,000,000 worth of projects.

This backlog represented about 45,000 man-months of labor and an expenditure of at least \$15,000,000 for equipment and materials.

Money for these projects already had been appropriated by the Congress prior to and during the early months of the war and was being held in reserve for continuance of the agency's peacetime program.

In addition to this sum, it was estimated that at least \$25,000,000 more must be spent, following the war, on Bonneville's huge network of transmission lines, if the Congress appropriated funds for addi-

tional generators at Grand Coulee Dam and for construction of the \$90,000,000 Umatilla Dam.

The initial \$26,000,000 program included nearly 35 individual projects involving additions to existing substations, construction of new substations, construction of new high-voltage transmissiin lines and extensions to Bonneville's subtransmission system. The plan also included about \$11,000,000 of expenditure for a wide variety of service lines, substations and other facilities for the delivery of Columbia River power to public distribution agencies in Oregon and Washington.

It was the Administration's view that such a program was in conformance with Department of Interior policy to build Northwest power facilities in advance of need.

Such a policy had already paid high dividends, both in promoting industrialization prior to the war and in heavy contribution to war production following Pearl Harbor.

Division of Power

ARTHUR GOLDSCHMIDT, Acting Director

THE INCREASING number and complexity of the power problems of the Department during the past year resulted in a great increase in the work of the Division of Power. In large part, the added problems were a direct consequence of the tremendous expansion of the power facilities under the control of the Department. Work of the Division was further augmented by the fact that the power program of the Department is in general undergoing a transition from a construction stage to an operations and marketing stage, with present emphasis upon the disposition of power to meet the demands of the war program. Problems of policy and practice dealing with marketing and related activities require considerably more of the attention of the Secretary and of this Division than do problems of construction. For the most part construction problems have related to the action of the War Production Board in curtailing construction and equipment installation on several of the most important of the partially finished projects of the Department. The shift in emphasis in the war program from the production of materials and munitions to the production of food and the conservation of fuel and manpower, has further enhanced the value of hydroelectric projects of the Department which combine irrigation and power features.

As a result of 2 years of experience in which an efficient working procedure between the Division of Power and the Department's power operating agencies in the field has developed, an order of the Secretary was issued further formalizing the relationship between the Division of Power and the agencies and codifying the tested procedural arrangements. The order effectively summarizes the function of the Division as follows:

The Division of Power assists the Secretary in supervising the discharge of the Department's responsibilities in electric power matters. The primary

duties of the Division of Power are to assist (1) in the formulation and coordination of the Department's objectives, policies and programs to encourage and facilitate the most widespread use of electric power in the public interest and, during the present emergency, to assure the most effective utilization of the Department's power resources in the prosecution of the war; (2) in the prompt dissemination to the bureaus and offices of information as to the Department's objectives and policies; and (3) in the supervision of the application and prosecution of these policies and programs.

The order provides for the handling of contractual matters, statistics and reports, rates, budget matters, market development programs, findings of feasibility and construction programs. The resources and personnel of the Division are made available to all bureaus and offices of the Department, whether directly concerned with power or not, in the development of programs affecting power. With the issuance of this basic manual of administrative responsibility and practice the Division of Power has established a sound basis for the administration of far-flung and varied power developments under the jurisdiction of the Department of the Interior.

EXPANSION AND UTILIZATION OF FACILITIES

The major portion of the power from Department projects is sold wholesale to war industries and military and naval establishments and to public and private distributing agencies. The great volume of power which has been made available for war purposes by plants of the Department has played a most important and in some respects a crucial role in the ability of the Nation to meet war production demands. It is estimated that generators in the power plants of the Department will produce, and the agencies of the Department will dispose of, approximately 14,900,000,000 kilowatt-hours of electrical energy in 1943. This is an increase of nearly 300 percent over the Department's power production of 1940. The most significant increases during the past year have been at Grand Coulee where four 108,000- and two 75,000-kilowatt generators are now in service. Two more 108,000-kilowatt units are scheduled for operation shortly. The Green Mountain plant of the Bureau of Reclamation, first of the plants of the Colorado-Big Thompson project, also began operations with a capacity of over 20,000 kilowatts. The Parker Dam project on the Colorado River in Arizona and California with an installation of 120,000 kilowatts reached full production early in 1943. At the end of the fiscal year final tests were being completed at the Fort Peck project, a United States Engineers' project on the Missouri River in Montana for which the Department has by act of Congress been given the responsibility of marketing the power.

The Division of Power endeavors to see that the power facilities of the Department are used to the utmost in the war program by ordinary direct sale as well as by special arrangement where necessary. During the year an agreement was effected by the Bureau of Reclamation and the Indian Service to pool power on the Parker Dam transmission system in Arizona, utilizing power generated from the San Carlos project of the Indian Service and by several private utilities in the area, in order to guarantee adequate power for the magnesium plant in Las Vegas and other war loads in the area. In line with the President's directive to war procurement agencies and the Federal Power Commission to arrange for the purchase of power from the cheapest reliable sources, the Division asked the agencies of the Department to keep abreast of present and prospective war loads in order to determine whether and how they may be served more economically from facilities of the Department.

One of the fundamental power policies of the Department is that the abundant power resources under its jurisdiction be so managed as to assure the widest possible use of electric energy at the lowest possible cost to the consumer. In addition to searching for means of effecting economies by means of transmission and delivery arrangements, the Division is constantly endeavoring to keep the rates for power sold by the Department to the lowest level feasible under the law and compatible with good business practice. To this end, during the year the Division consulted with and advised a number of other agencies of the Government including the Defense Plant Corporation, Federal Power Commission and the National Housing Agency. The staff of the Division has also been actively engaged for several months in basic technical and other work involved in a reduction in wholesale power rates for all Reclamation power projects in Wyoming. The Division has made standard in the Department the practice of securing from purchasers of power for resale an agreement that resale rates will be kept at the lowest feasible level in order to assure that the benefits of low cost power developed at the projects of the Department are passed on to the ultimate consumer and also to assure a continuing market for the Department's power.

During the year the War Production Board stopped construction on the Anderson Ranch Dam in Idaho, the Davis Dam in Arizona, the Colorado-Big Thompson project in Colorado, and the Keswick Dam in California. Projected power machinery installations at Grand Coulee Dam and the Shasta Dam in California were cut. The Division participated actively and with partial success in the efforts of the Department to obtain revocation or modification of these stop orders to prevent waste, and to provide for a safe margin of power capacity in

the war program, to save manpower and fuel and to increase food production.

CONTRACTS

During the past year the Division has reviewed 90 contracts for the sale of power from the many projects of the Department to consumers or distributing agencies, public and private. Approximately one-half of these contracts involved the sale of power to war industries and naval and military establishments. Contracts of the latter kind accounted for far more than half of the aggregate amount of power sold and the technical and policy problems presented by such contracts were much more intricate than those presented by the nonwar contracts. In addition to the review of contracts, with the technical and legal work required therefor, the Division has participated in the negotiation of several of the larger war contracts of both the Bureau of Reclamation and the Bonneville Power Administration. Although it is a basic policy of the Department to decentralize the administration of its power projects, during this war period certain important negotiations with other agencies of the Government must necessarily be handled in Washington. The Division has been able to effect a saving in time and money by carrying on and unifying such activities. In addition, constant negotiation of a general nature with the War Production Board, other Federal agencies and representatives of groups wishing to obtain power has been necessary.

CENTRAL VALLEY

Members of the staff of the Division are participating in several of the studies now under way for the Central Valley project in California. These studies, which are under the direction of a representative of the Bureau of Reclamation and are being made by committees upon which are representatives of various groups and interests, Federal as well as local, encompass all of the many problems to be encountered in the development and operation of this vast project. A number of the problems directly or indirectly involve the power features of the project.

Throughout the past year the Division and the Bureau of Reclamation have been engaged in negotiating a contract for the sale of a large block of power from the Shasta Dam power plant to the Pacific Gas & Electric Co. Due to lack of facilities for line construction, power from the first two 75,000-kilowatt generating units that the War Production Board has allowed to be installed must be sold to the company during the war, so that it may be devoted to war uses with the least expenditure of critical materials.

MISCELLANEOUS

During the year the Division assisted in the drafting of new regulations governing the granting of right-of-way easements for transmission lines over lands under the jurisdiction of the Department. The Division was also able to suggest special conditions or stipulations for the full protection of the public interest in a number of the right-of-way permits reviewed. The Division continued to take part in the handling of the legislative problems of the Department which relate to or affect power. Among the matters of this kind which required attention were two compacts for the apportionment of the waters of interstate streams. The Division also advised and assisted the other agencies, particularly the Bonneville Power Administration, with questions of litigation having important policy implications.

Four major problems were active in the Division at the end of the year. Careful study was being given to the report of the Bureau of Reclamation upon the proposed Canyon Ferry irrigation and power project for the upper Missouri River near Helena, Mont. The reports and recommendations of the representatives of the Department engaged in working out the allocation of costs of the Grand Coulee Dam project between power, irrigation, and other uses were almost ready for submission to the Commissioner of Reclamation, the Administrator of the Bonneville Power Administration and the Director of the Division in order to provide the Secretary with a basis for determining the final cost allocation. Members of the staff of the Division were also working with the Bureau of Reclamation on plans for the disposition of power from the Fort Peck project in Montana and in North Dakota where the power can serve the Nation at war by replacing gas fuel and permitting increased irrigation for food production. Study was being given to the administrative and legal relationship between the Department and the Salt River Valley Water Users Association in Arizona in cooperation with that association.

Division of Territories and Island Possessions

BENJAMIN W. THORON, Director

DURING the past year the Division has been reorganized to meet more effectively the increasing and complex problems in the Territories and islands as a result of their strategic location in the war picture. It has worked closely with other agencies and Departments of the Government in an effort to coordinate programs and eliminate duplication of activities. Each area is confronted with unique problems and each requires individual solution. The Virgin Islands and Puerto Rico were in a particularly critical situation as a result of the shipping shortage and submarine activity in the summer and fall of 1942. Here an acute crisis in the supply of the necessities of life was narrowly averted by the Civilian Food and Supply Unit, established to carry out the provisions of Public Law 371, Seventy-seventh Congress, working in close cooperation with the Department of Agriculture and the War Shipping Administration to supply the immediate needs of the people of these areas.

As part of the operation, it was contemplated originally that stock piles of food, drugs, hospital supplies and other materials, supplies and equipment would be established at carefully selected points in order to meet the emergency needs of the civilian population in the event that Alaska, the Virgin Islands, or Puerto Rico should be cut off from the mainland through enemy action or shipping service disrupted to such an extent that regular supply was found impossible. Plans were formulated for the establishment of such stock piles and a quantity of food and medical supplies for this purpose was shipped to the Virgin Islands in early 1942.

In the case of Puerto Rico, shipping suffered increasingly because of enemy submarine action during the spring and summer months of 1942 to such an extent that the supply of the island was seriously threatened and it became necessary, in order to insure that food necessary to feed the Puerto Rican people would reach the island in

the available shipping space, that the Food Distribution Administration (then the Agricultural Marketing Administration) of the Department of Agriculture purchase and ship the basic food requirements. An agreement was reached between the Department of the Interior and the Department of Agriculture under which the FDA would furnish and, acting for this Department, distribute by sale to wholesalers in Puerto Rico the different food items in accordance with estimates of requirement set up by this Department. Many difficulties were encountered at the outset in placing the operation in effect, not the least of which was the very limited amount of shipping space which was made available for Puerto Rican service during the latter part of 1942 and January 1943, due to the extreme need for vessels in other war areas. Since last February, the War Shipping Administration has increased shipping to Puerto Rico to such an extent that it has been feasible to bring stocks of all necessary food items in Puerto Rico to a very satisfactory level. Also, shipments of supplies needed by industry, as well as consumption foods, have been made in such quantities that the Puerto Rican supply situation generally is in a good and satisfactory condition. This has been made possible by the agreement between the War Shipping Administration and the Department that after September 1, 1942, all cargo space on ships sailing for Puerto Rico, with the exception of military vessels, would be allocated by the Department of the Interior and that only cargo approved by this Department would be loaded. Such action has insured that the food and general supplies most needed in the Island would be loaded in the available shipping space. By January 1943 a plan was put in operation through which applications for importation of goods, other than food, would be cleared by the General Supplies Administration, a Puerto Rican governmental office, before the Civilian Food and Supply Unit would allocate steamship space. This plan has worked out most satisfactorily and is in line with the desire to forward supplies in accordance with priorities set up by the Puerto Rican Government in consultation with representatives of local business and industry.

In all plans for shipping Puerto Rico and the Virgin Islands have been considered jointly, since there have been no large vessels going directly to the Virgin Islands and all supplies consigned to the Virgin Islands must be transhipped from San Juan. The FDA has also acted in a similar capacity for the Virgin Islands.

The establishing of emergency stock piles has been carried out in Alaska. Large shipments of food and other supplies necessary for the civilian population in case of need were made in the fall of 1942 and suitably warehoused at a number of strategic points in the Terri-

tory. The facilities of the Native Stores of the United States Indian Service have been utilized to the fullest possible extent in carrying additional emergency supplies wherever such stores are in operation. Recently it has been found advisable to place in normal consumption channels or sell to the military forces practically all of the food supplies which were sent to the Territory last year. This has been accomplished in a satisfactory manner and replenishing the stock piles with fresh supplies has been moving forward for several months and will continue. In addition, every assistance possible has been rendered to the exporters to Alaska in the obtaining and shipping of food and other supplies in order that normal consumption requirements of the Territory could be met in a satisfactory manner.

The influx of Army, Navy, and civilian workers into Alaska has made a heavy drain on local resources already strained to capacity as a result of military operations. Labor turn-over has been heavy with the various agencies competing for the available supply. The Alaska Railroad particularly has suffered as a result of the shortage and recruitment of qualified personnel has been carried on with the help of the War Manpower Commission. In spite of these handicaps and the added fact that the winter was one of the most severe in the history of Alaska, the railroad maintained its schedules almost without interruption and kept the flow of supplies and military equipment moving steadily.

As the possibility of a Japanese attack on Hawaii appeared to become more remote, consideration was given to the return to civilian control many functions that had been taken over by the military in Hawaii when martial law was declared immediately after the December 7 attack. Accordingly, in August this Department joined with the Department of Justice in opening negotiations with the War Department for the restoration of civil jurisdiction and the distribution of governmental functions in the Territory of Hawaii as between the civilian and military authorities. All angles of the problem were thoroughly explored and an agreement reached as a result of which, on February 8, 1943, proclamations were issued in Hawaii simultaneously by the Governor of Hawaii and the Commanding General of the Hawaiian Department restoring specific functions to civilian control.

The program of civilian defense protection in Hawaii continues to maintain a high degree of efficiency and progress. One of its outstanding accomplishments was the establishment of an emergency poliomyelitis hospital. In the operation of the hospital the U. S. Army cooperated to the fullest extent by detailing 22 nurses and 13 Medical Department soldiers to comprise the staff of the unit. The people

the available shipping space, that the Food Distribution Administration (then the Agricultural Marketing Administration) of the Department of Agriculture purchase and ship the basic food requirements. An agreement was reached between the Department of the Interior and the Department of Agriculture under which the FDA would furnish and, acting for this Department, distribute by sale to wholesalers in Puerto Rico the different food items in accordance with estimates of requirement set up by this Department. Many difficulties were encountered at the outset in placing the operation in effect, not the least of which was the very limited amount of shipping space which was made available for Puerto Rican service during the latter part of 1942 and January 1943, due to the extreme need for vessels in other war areas. Since last February, the War Shipping Administration has increased shipping to Puerto Rico to such an extent that it has been feasible to bring stocks of all necessary food items in Puerto Rico to a very satisfactory level. Also, shipments of supplies needed by industry, as well as consumption foods, have been made in such quantities that the Puerto Rican supply situation generally is in a good and satisfactory condition. This has been made possible by the agreement between the War Shipping Administration and the Department that after September 1, 1942, all cargo space on ships sailing for Puerto Rico, with the exception of military vessels, would be allocated by the Department of the Interior and that only cargo approved by this Department would be loaded. Such action has insured that the food and general supplies most needed in the Island would be loaded in the available shipping space. By January 1943 a plan was put in operation through which applications for importation of goods, other than food, would be cleared by the General Supplies Administration, a Puerto Rican governmental office, before the Civilian Food and Supply Unit would allocate steamship space. This plan has worked out most satisfactorily and is in line with the desire to forward supplies in accordance with priorities set up by the Puerto Rican Government in consultation with representatives of local business and industry.

In all plans for shipping Puerto Rico and the Virgin Islands have been considered jointly, since there have been no large vessels going directly to the Virgin Islands and all supplies consigned to the Virgin Islands must be transhipped from San Juan. The FDA has also acted in a similar capacity for the Virgin Islands.

The establishing of emergency stock piles has been carried out in Alaska. Large shipments of food and other supplies necessary for the civilian population in case of need were made in the fall of 1942 and suitably warehoused at a number of strategic points in the Terri-

tory. The facilities of the Native Stores of the United States Indian Service have been utilized to the fullest possible extent in carrying additional emergency supplies wherever such stores are in operation. Recently it has been found advisable to place in normal consumption channels or sell to the military forces practically all of the food supplies which were sent to the Territory last year. This has been accomplished in a satisfactory manner and replenishing the stock piles with fresh supplies has been moving forward for several months and will continue. In addition, every assistance possible has been rendered to the exporters to Alaska in the obtaining and shipping of food and other supplies in order that normal consumption requirements of the Territory could be met in a satisfactory manner.

The influx of Army, Navy, and civilian workers into Alaska has made a heavy drain on local resources already strained to capacity as a result of military operations. Labor turn-over has been heavy with the various agencies competing for the available supply. The Alaska Railroad particularly has suffered as a result of the shortage and recruitment of qualified personnel has been carried on with the help of the War Manpower Commission. In spite of these handicaps and the added fact that the winter was one of the most severe in the history of Alaska, the railroad maintained its schedules almost without interruption and kept the flow of supplies and military equipment moving steadily.

As the possibility of a Japanese attack on Hawaii appeared to become more remote, consideration was given to the return to civilian control many functions that had been taken over by the military in Hawaii when martial law was declared immediately after the December 7 attack. Accordingly, in August this Department joined with the Department of Justice in opening negotiations with the War Department for the restoration of civil jurisdiction and the distribution of governmental functions in the Territory of Hawaii as between the civilian and military authorities. All angles of the problem were thoroughly explored and an agreement reached as a result of which, on February 8, 1943, proclamations were issued in Hawaii simultaneously by the Governor of Hawaii and the Commanding General of the Hawaiian Department restoring specific functions to civilian control.

The program of civilian defense protection in Hawaii continues to maintain a high degree of efficiency and progress. One of its outstanding accomplishments was the establishment of an emergency poliomyelitis hospital. In the operation of the hospital the U. S. Army cooperated to the fullest extent by detailing 22 nurses and 13 Medical Department soldiers to comprise the staff of the unit. The people

of Hawaii have maintained splendid morale and continue to work at the grim business of war with high courage and devotion to duty.

Steady progress has been made in the adjustment of the Puerto Rican hurricane relief loans made by the former Hurricane Relief Commission from 1929 to 1933. Loans adjusted to June 30, 1943, number 852. The total amount collected is \$706,213.12. Much opposition encountered in the past to the settlement of these loans has now almost disappeared and with better cooperation from the borrowers it is expected that the number of adjustments will rapidly increase. Minor crops are being raised in connection with the war program for which the farmers are receiving better prices, and it is a good sign to observe that this increased income is being used in liquidating old debts and the freeing of their properties from the mortgages held by the Government.

A more detailed report of activities in each area follows:

TERRITORY OF ALASKA

War is still the overshadowing fact in Alaska. The inhibitions which existed a year ago against detailed discussion of the great transformation wrought by military requirements still prevail to a considerable degree. This much, however, may be said: with the recapture of Attu and the isolation of the Japanese on Kiska, the defensive stage of war in Alaska has ended. The initiative is now wholly with the United States. The destruction of the enemy on Kiska is as much of a certainty as any future event in war may be deemed to be. The only important question remaining in regard to Kiska relates to the time when the high naval command, to which has been delegated the responsibility of expulsion of the Japanese from the Aleutians, decides to take the necessary action. Kiska is isolated and completely neutralized and Alaska has become a thoroughfare for offensive action further west. This dramatic and important change may be said to coincide with the termination of the fiscal year 1942.

In the development of the campaign to drive the Japanese invader from North America, the Aleutian islands, previously almost uninhabited (west of Umnak the only settlements were on Atka and Attu) have been galvanized into great activity. The offensive power of the United States in the Pacific has been greatly strengthened thereby and extended farther west in the North Pacific than ever before. At the outbreak of the war, Dutch Harbor, at the inner (eastern) end of the Aleutians, represented the farthest west of our military establishments in the Pacific. Pearl Harbor, in the Hawaiian Islands, is on the 158th parallel of west longitude. Dutch Harbor is

between the 166th and 167th. Our fortifications now extend to the end of the Aleutian chain, and it has become the northern half of the Pacific pincers which will ultimately close on the Japanese enemy. Attu, astride the 173d parallel of longitude east, has now become our farthest west military base on American soil, and, with Amchitka, constitutes our first base on American soil in the eastern hemisphere in this war.

As the tide of military action has swept westward, the military bases on the Alaska mainland, originally constructed for defensive purposes, have diminished in activity and importance and have become increasingly depots for the transshipment of men, matériel, and supplies, to the western front. The requirements of transshipment and transportation have brought important changes to Alaska, the most striking of which is the Alaska Military Highway. This route, the construction of which was begun in the spring of 1942, connects Dawson Creek in British Columbia (northern terminus of our international continental railroad system) by highway with the Alaska system of roads. The chief value of this military highway to date has been in connection with the maintenance of an airway which passes from Minneapolis through Edmonton and Whitehorse to Alaska. This airway has proved its value and establishes a new method of ingress and egress from Alaska—formerly all Alaska traffic passed through Seattle. Of considerable potential significance for Alaska is the 151-mile branch road destined for completion during 1943 from Haines at the upper end of the Inside Passage to meet the Alaska Military Highway 108 miles west of Whitehorse. A road 42 miles in length already extended from Haines to the Canadian boundary. Its extension by 109 miles over the Chilkat Pass and the historic Jack Dalton Trail links the southeastern Alaska "panhandle," hitherto unconnected, with the new international highway system and should constitute the most direct and least costly route from the United States to interior Alaska. A direct overland telephone system from Alaska to the United States is an important accompaniment of this highway construction.

Immediately after the outbreak of war the Governor requested legislation of the Congress to permit the organization of a Territorial Guard, the four companies of the Alaska National Guard organized in 1940 having been inducted. It was his belief that as far as possible there should be no civilian spectators, no passive noncombatants, in Alaska, and that in the event of invasion, which was deemed a distinct possibility at that time and for a year thereafter, every able-bodied person should be prepared to fight. The authorized strength of the Alaska Territorial Guard is 6,000. One hundred and three units have

been organized, and the enrollment, in proportion to population, appears to be the largest of any State or Territory.

In the sale of war bonds, Alaska has consistently exceeded substantially. In the final month of the fiscal year 1943, Alaska was one of 5 States and Territories to do so. In that month Alaska was second in the Nation, exceeding all of the 48 States with a percentage of 114.5 and being second only to Hawaii.

An important concomitant of war has been the search for minerals in Alaska, whose mining hitherto was largely devoted to gold. Gold mining has been suspended for the duration except in those areas where its extraction is accompanied by the recovery of strategic minerals. The United States Bureau of Mines, in collaboration with the Territorial Department of Mines, is carrying on a search for minerals which has already resulted in the production of chromite, molybdenum, tungsten, and mercury. The development of deposits designed to stop the wasteful importation of coal from the States to satisfy Alaska's needs, is now under way.

THE ALASKA RAILROAD

The Alaska Railroad experienced one of the most difficult years in its history. This was due to a number of factors, the following:

The winter of 1942-43 was one of the most severe in the history of the Territory of Alaska. Intense cold prevailed for long periods; there was an unprecedented snowfall; severe floods occurred on several occasions causing considerable damage to roadbeds and bridges. A fire in a tunnel interrupted traffic for several weeks. Many employees were lost during the year whom it was impossible to replace. Despite these difficulties the railroad was called upon to transport an increased amount of supplies and equipment and move additional personnel in connection with military activities.

The employee problem was solved in part through the cooperation of the War Department, which assigned a railway operating detachment of enlisted men to assist in operation and maintenance. The War Department also rendered invaluable assistance in the securing of additional rolling stock to move the increased volume of freight being transported.

The construction of the new railroad cut-off, 14 miles in length, between Portage and Whittier, including two long tunnels, was completed during the year, and this new line was put into full operation. The necessary facilities at Whittier, including docks, railroad facilities, and utilities that are required for the transfer of freight from

railroad cars, were completed and put into operation. Construction of a new concrete depot and office building at Anchorage, was also finished during the year.

The coal mine at Eska, operated by the railroad, was improved to an extent that it was possible to increase materially the production of coal from this mine.

Freight and passenger service between Seward and Fairbanks, and branch lines serving the Matanuska farm colony and the coal fields, was furnished throughout the year, and river boat service was maintained on the Yukon and Tanana Rivers during the season of river navigation.

TERRITORY OF HAWAII

The fiscal year ending June 30, 1943, saw the Territory of Hawaii make great advances in fortifying the civilian population against every possible consequence of the war.

Hawaii is in the Pacific theater of World War II; it is the most important United States outpost in this area. As such it must expand and enlarge its facilities to accommodate the thousands of armed personnel and defense workers that have come here; it must take steps to educate and protect the resident population against enemy activities, both from within and without; it must cooperate with military, naval, and other agencies to make Hawaii impregnable and secure against every emergency. All these, and more, Hawaii has contributed and accomplished during the past 19 months.

Every man, woman, and child is aware of the importance of Hawaii as a base for our forces; everyone has willingly gotten behind the war effort and has made it possible, in such a short period of time, to put our area in readiness for the great offensive against Japan.

Under the direction and supervision of the Office of Civilian Defense, the whole territory is now honeycombed with bomb shelters and all vital civilian installations have been protected against damage by blinder and bomb-proof shelters. Emergency hospitals and auxiliary first-aid stations, manned by hundreds of volunteer nurses and aides, have been constructed throughout the Territory. Emergency evacuation camps, kitchens, and food storage places have likewise been erected in areas removed from military objectives.

The civilian population has been immunized, finger printed, and furnished gas masks and has been trained for fire fighting, first aid, gas defense, block patrolling, etc. The populated areas of Hawaii have been supplied with air-raid sirens, the water supply has been chlorinated against bacterial contamination; utility installations are under

constant guard; emergency police and fire reserves supplement the regulars.

The production of food has been increased to make Hawaii more nearly self-sustaining. The sugar and pineapple plantations have turned over thousands of acres of land for production of food for local consumption. This has relieved shipping space for other essential commodities and supplies. Hawaii, prior to the war, did not produce sufficient fresh vegetables to supply local needs. A monthly production of about 4,000,000 pounds before the war has been increased to approximately 8,000,000 pounds. Poultry, pork, and beef cattle production, though handicapped by shortage of feed, has nevertheless been able to hold its own through local feed production.

Mass influx of workers, overcrowding, black-out restrictions, and general inability to live normally under present conditions have created numerous problems of housing, hospitalization, sanitation and garbage disposal, disease control, juvenile delinquency, crime prevention, etc. The Territory is making every attempt to handle and alleviate these conditions.

Evacuation camps have been opened to homeless and distressed families. Approval for construction of some additional 1,000 housing units has been obtained but unless lumber and other essential materials are made available this project will fail.

During the past year four diseases—mumps, whooping cough, poliomyelitis, and influenza—became epidemic. These were quickly controlled and the casualty rate was low. Venereal diseases have also been satisfactorily controlled, the rate dropping to an unprecedented low of 4.5. Tuberculosis, however, due to living conditions, is on the increase with over 2,000 cases for the past year as against an average of 1,500 for prior years.

The Territory is on guard against the outbreak of tropical diseases. This is a constant threat on account of contact with armed personnel passing through from other Pacific areas.

Business has had a prosperous year. This is reflected in an increase of tax revenues, both Territorial and Federal. Defense jobs and the presence of thousands of armed personnel have accounted for increased purchasing power. Inflation, however, has been kept down by price fixing and rationing under the Office of Price Control and the Office of Civilian Defense.

There has been an acute shortage of labor in Hawaii. Defense activities, with higher levels of wages, attracted labor from local industries. Hawaii was designated a "critical labor area" with a net shortage of 14,000 workers, the bulk being required for agriculture and for Army and Navy agencies.

All governmental agencies of the Territory devoted their resources and personnel to aid and cooperate with military, naval, and Federal agencies. This will continue until victory is achieved.

The restoration of civil affairs to civil authorities on March 10, 1943, has had a healthy reaction on the community. It has relieved military personnel for military duties; it has returned to civilians the responsibility of administering their own affairs. Hawaii can well be proud of its record of accomplishments. It is eager to demonstrate that its people are capable of carrying their share of any responsibility and of performing any task necessary to assure the fullest safety of the islands.

PUERTO RICO

SHIPPING AND SUPPLY SITUATION

Other important developments during the year were overshadowed by the shipping shortage and its serious effects on the island's economy.

With its 2 million population the island normally is dependent upon the continent for a third of its food (by weight) and for almost all of its clothing and other essential commodities.

Puerto Rico's shipping first began to feel the effects of the war as early as March 1942. In June incoming civilian cargo fell to less than a quarter of normal receipts. The situation became extremely critical in September 1942 when civilian tonnage reached an insignificant level—7 percent of the 1940 monthly average.

The strenuous efforts of the Insular Government and the Federal Department of the Interior averted the disaster which appeared inevitable. Representations of the island's minimum shipping needs were made to the War Shipping Administration with the result that additional tonnage was made available. An agreement was reached between the Department of the Interior and the Department of Agriculture whereby these agencies undertook to supply the island with basic foods.

Before the tide finally turned, however, the economy of the island sank to a level not far above the point of disintegration. For a considerable period basic foods such as rice and codfish were virtually unobtainable. Wholesalers and retailers generally were threatened with bankruptcy by the depletion of stocks. Employment, according to data obtained by the Insular Department of Labor, was 40 percent less in January 1943 than in June 1942.

Improvement in the supply situation, which began to be noticeable in December 1942, continued at an increasing rate to the end of the fiscal year. As a result, our position at the end of the year was in general the reverse of that in which we found ourselves at the begin-

constant guard; emergency police and fire reserves supplement the regulars.

The production of food has been increased to make Hawaii more nearly self-sustaining. The sugar and pineapple plantations have turned over thousands of acres of land for production of food for local consumption. This has relieved shipping space for other essential commodities and supplies. Hawaii, prior to the war, did not produce sufficient fresh vegetables to supply local needs. A monthly production of about 4,000,000 pounds before the war has been increased to approximately 8,000,000 pounds. Poultry, pork, and beef cattle production, though handicapped by shortage of feed, has nevertheless been able to hold its own through local feed production.

Mass influx of workers, overcrowding, black-out restrictions, and general inability to live normally under present conditions have created numerous problems of housing, hospitalization, sanitation and garbage disposal, disease control, juvenile delinquency, crime prevention, etc. The Territory is making every attempt to handle and alleviate these conditions.

Evacuation camps have been opened to homeless and distressed families. Approval for construction of some additional 1,000 housing units has been obtained but unless lumber and other essential materials are made available this project will fail.

During the past year four diseases—mumps, whooping cough, poliomyelitis, and influenza—became epidemic. These were quickly controlled and the casualty rate was low. Venereal diseases have also been satisfactorily controlled, the rate dropping to an unprecedented low of 4.5. Tuberculosis, however, due to living conditions, is on the increase with over 2,000 cases for the past year as against an average of 1,500 for prior years.

The Territory is on guard against the outbreak of tropical diseases. This is a constant threat on account of contact with armed personnel passing through from other Pacific areas.

Business has had a prosperous year. This is reflected in an increase of tax revenues, both Territorial and Federal. Defense jobs and the presence of thousands of armed personnel have accounted for increased purchasing power. Inflation, however, has been kept down by price fixing and rationing under the Office of Price Control and the Office of Civilian Defense.

There has been an acute shortage of labor in Hawaii. Defense activities, with higher levels of wages, attracted labor from local industries. Hawaii was designated a "critical labor area" with a net shortage of 14,000 workers, the bulk being required for agriculture and for Army and Navy agencies.

All governmental agencies of the Territory devoted their resources and personnel to aid and cooperate with military, naval, and Federal agencies. This will continue until victory is achieved.

The restoration of civil affairs to civil authorities on March 10, 1943, has had a healthy reaction on the community. It has relieved military personnel for military duties; it has returned to civilians the responsibility of administering their own affairs. Hawaii can well be proud of its record of accomplishments. It is eager to demonstrate that its people are capable of carrying their share of any responsibility and of performing any task necessary to assure the fullest safety of the islands.

PUERTO RICO

SHIPPING AND SUPPLY SITUATION

Other important developments during the year were overshadowed by the shipping shortage and its serious effects on the island's economy.

With its 2 million population the island normally is dependent upon the continent for a third of its food (by weight) and for almost all of its clothing and other essential commodities.

Puerto Rico's shipping first began to feel the effects of the war as early as March 1942. In June incoming civilian cargo fell to less than a quarter of normal receipts. The situation became extremely critical in September 1942 when civilian tonnage reached an insignificant level—7 percent of the 1940 monthly average.

The strenuous efforts of the Insular Government and the Federal Department of the Interior averted the disaster which appeared inevitable. Representations of the island's minimum shipping needs were made to the War Shipping Administration with the result that additional tonnage was made available. An agreement was reached between the Department of the Interior and the Department of Agriculture whereby these agencies undertook to supply the island with basic foods.

Before the tide finally turned, however, the economy of the island sank to a level not far above the point of disintegration. For a considerable period basic foods such as rice and codfish were virtually unobtainable. Wholesalers and retailers generally were threatened with bankruptcy by the depletion of stocks. Employment, according to data obtained by the Insular Department of Labor, was 40 percent less in January 1943 than in June 1942.

Improvement in the supply situation, which began to be noticeable in December 1942, continued at an increasing rate to the end of the fiscal year. As a result, our position at the end of the year was in general the reverse of that in which we found ourselves at the begin-

ning of the year. Instead of critical shortages we had substantial surpluses of most basic commodities. Industry and business had revived, and this revival was reflected in employment figures. Employment in our manufacturing industries, for example, was only 5 percent less in June 1943 than in June 1942. The increase in shipping during the last half of the year also resulted in an export total for the year only slightly below normal.

CONGRESSIONAL COMMITTEES

During the year Puerto Rico was visited by two congressional committees—the Chavez Committee of the Senate and the Bell Committee of the House. Both committees held extensive hearings and made first-hand inspections of various phases of insular life. After returning to Washington the Chavez Committee continued to take an active interest in the island's problems and was extremely helpful in the solution of some of them, notably the shipping problem. The Bell Committee came to the island late in the fiscal year, and, therefore, it is not yet known what the results of its investigations may be.

RELIEF REQUIREMENTS

Due to Puerto Rico's lack of war industries, and to stagnation of business and industry as a result of inadequate shipping, the need for relief increased drastically. The work relief program carried on by the WPA was increased; the free food distribution program of the FDA was stepped up and, in addition, the insular legislature established an insular emergency program and appropriated \$16,000,000 to that agency for direct and work relief.

TREASURER

Despite the dark prospect at the beginning of the year, the Treasurer cautiously estimated probable receipts at \$28,000,000. The auditor gloomily estimated \$14,000,000. Actually, over \$41,000,000 was collected. This was an all-time peak, over \$4,000,000 more than the previous year. Income taxes accounted for much of the increase, collections rising from \$7,635,383 the previous year to \$11,312,371. During the year, the insular public debt was reduced from \$23,700,000 to \$16,398,000, the lowest level in 20 years.

DEPARTMENT OF JUSTICE

The Department of Justice had a busy year in the courts. There were a number of cases, involving income taxes, brought against the treasurer. The Department also cooperated with the Land Authority

in cases which sprang from enforcement of the 500-acre law. One important case led to a consent decree between the Government and the South Porto Rico Sugar Co., which was approved by the supreme court of Puerto Rico. Under its terms, some 22,000 acres of land will be conveyed to the Land Authority. Other consent-decree cases with large sugar companies are being negotiated.

LABOR

During the year there were numerous labor disputes due chiefly to economic pressure resulting from increasing living costs in the face of nearly static income. The Federal Conciliation Commissioner, who worked in close harmony with the Insular Department of Labor, intervened in 97 cases, and had remarkable success in effecting settlements. The Insular Conciliation Commissioner, who took office on March 8, handled 47 cases between that time and the end of the fiscal year.

The most serious dispute of the year involved 1,300 railroad workers. When these workers struck, the Governor immediately immobilized traffic for 48 hours and, thereafter, the ODT took over the management of the road under an Executive order of the President of the United States. The War Labor Board appointed a panel to arbitrate the dispute.

EDUCATION

Enrollment in the public schools continued to increase, totaling for 1942-43 321,568, or 9,232 more than in the previous year. The language problem was given serious attention. Experts from the continental United States were brought to the island to study the effect of teaching in two languages.

The University of Puerto Rico underwent a major change. Under the new University Law, which became effective during the year, the old Board of Trustees was superseded by a Superior Council of Education. A new Chancellor was appointed and he immediately instituted basic reforms, the efficacy of which remain to be determined.

HEALTH

The Department of Health reports an increase in the birth rate for 1942 of 1.2 percent over the previous year. The death rate was 16.6 percent as compared with 18.4 percent the previous year. The leading causes of death were: (1) diarrhea and enteritis; (2) tuberculosis; (3) pneumonia and heart disease.

Strenuous efforts were continued to combat venereal disease. Two special hospitals for the treatment of venereal disease were opened,

and plans were made for several more. Malaria control work was also pushed.

DEPARTMENT OF AGRICULTURE

War-time conditions produced special problems in the field of agriculture. The securing of seed and fertilizer was very difficult. This situation eased toward the end of the year, however.

One serious problem, which remains unsolved, is the disposal of molasses. Because no tankers were available, none of the 1943 production was moved from the island.

The Insular Department of Agriculture inaugurated an extensive seed-production program, under an agreement with the Federal Department of the Interior. This program, together with the price-support program of the Food Distribution Administration, has already increased local food crop production and is expected to step it up even further.

PLANNING BOARD

The Puerto Rico Planning, Urbanizing, and Zoning Board began work in 1942. Cooperating with the emergency program, the planning board classified and reviewed all work-relief projects of the program.

As part of its regular activities, the planning board held public hearings on its master plan of major thoroughfares in the San Juan metropolitan area. It made various studies, including a special investigation of conditions on the island of Vieques, which has been seriously affected by war conditions.

LAND AUTHORITY

During the year, the Land Authority acquired 16,101 acres of land in 30 different municipalities at a total value of \$2,051,801.08, an average of \$125.21 per acre. A total of 4,212 families (about 22,000 people) have received parcels of one-fourth to one cuerda each. Six proportional-profit farms, comprising 5,371 cuerdas, are being operated on land bought from Central Cambalache.

WATER RESOURCES AUTHORITY

It seemed necessary under war conditions to unify all sources of power in the island. As a result of condemnation proceedings under the Lanham Act, the properties of the Porto Rico Railway Light & Power Co. and the Mayaguez Light, Power & Ice Co. were delivered to the Federal Works Administrator, who entered into a contract with the Water Resources Authority to operate them. Suits to determine the final disposition of the properties are still pending.

The Garzas plants, which had been operating from low-stage reservoir storage since November 1941, became full-stage producers. Dos Bocas, which was 98 percent completed at the end of the previous fiscal year, came into production.

TRANSPORTATION AUTHORITY

The Puerto Rico Transportation Authority acquired the White Star Bus Line, serving the metropolitan area of San Juan, in November 1942. When the Authority took over, not more than 40 of the 229 busses belonging to the company were fit for service. Lack of repair parts and tires presented special difficulties. By March, however, the Authority had 65 busses moving. Sixty more will be put into service upon arrival of new motors which have been ordered with War Production Board approval.

DEVELOPMENT COMPANY

The Puerto Rico Development Co., established for the purpose of stimulating the growth of industries, made substantial progress. A glass factory to produce bottles is now under construction, and is expected to begin operation before the end of 1943. Plans are being studied for the construction of a wallboard factory which would utilize bagasse, a waste product of sugarcane. The possibility of establishing a textile factory, a paper mill and a yeast plant are also being studied.

The company has contracted with local manufacturers for the production of bamboo furniture from designs furnished by the company. It has made a similar contract for the manufacture of white ware and pottery. These products are already being successfully sold on the local market.

VIRGIN ISLANDS

The war has been the dominating factor in Virgin Islands economy, and its effects have been demonstrated in all phases of community life. Although the danger of attack by air or surface raider became more remote after the occupation of North Africa by the United Nations, the program of civilian defense initiated with success in the preceding fiscal year was prosecuted with vigor. Fire defenses were improved, raid drills and blackouts were carried out, home guards were trained intensively and the American Red Cross extended its facilities and activities supported by financially successful campaigns. During the past year the armed forces have been a large element in the life of the communities in the Virgin Islands.

As the Virgin Islands were early to feel the economic uplift of the war, so they are among the first American communities to experience the inevitable retrogression. During the year under review, defense construction operations gave employment on the island of St. Thomas to every employable male worker, and the shortage of native labor to meet the abnormal demand resulted in heavy importations of labor from neighboring British islands. With the reduction of defense construction, as the year grew to a close, a great many of the imported aliens were repatriated.

However, unemployment undoubtedly will be the most serious consideration in the Virgin Islands in the immediate future. Projects for water storage in St. Croix, for the extension of water supply facilities in St. Thomas, and the construction of highways in both islands, commenced in earlier periods, must be prosecuted vigorously to relieve unemployment as well as to provide basic improvements in the communities. These projects can be expanded without detriment to the larger interests of the national war effort because critical material is not involved. Projects for construction of new hospitals, extension of sewerage systems, sanitation facilities and many other projects of like nature, which are absolutely essential to the health and general welfare of the people of the islands must, of necessity, be deferred.

The attention of the administration has been largely directed to the connected problems of food and shipping. Early in the year, the Department of the Interior, through its special defense appropriation, established civilian food reserves to insure that basic food commodities would be available to the people of the islands in spite of disruption of commercial trade and shipping facilities. The Food Distribution Administration of the Department of Agriculture now acts as the agent of the Department of the Interior in the purchase of foods requisitioned by that Department and in their distribution through sale to the merchants in the islands. Steamship space for shipment of both food and general supplies required in the islands is made available by the Department of the Interior in vessels assigned by the War Shipping Administration. These supply agencies function successfully with the result that a sufficient supply of foodstuffs is available.

On the island of St. Croix, the Work Projects Administration developed an extensive project of vegetable production for the public institutions. On the island of St. Thomas, municipal appropriations were used to provide a direct labor subsidy to encourage an increase in the production of vegetables and other locally grown products. The problems of price adjustment and rationing were met by the

Office of Price Administration which extended its activities to the islands.

The abattoir on the island of St. Croix, constructed in a prior period from Federal funds, furnished dressed meat to the new Cold Storage Market in St. Thomas, likewise constructed from Federal appropriation. The profitable operation of the abattoir on a commercial basis appears to be doubtful because of its size and the unavailability of sufficient livestock. The Cold Storage Market at St. Thomas, on the other hand, gives hope of profitable operation and will be an increasingly important factor in the life of the community here by providing refrigerating facilities.

The Federal Works Agency, which late in the preceding fiscal year acquired a 1-year leasehold of the docks of The West Indian Co., Ltd., at St. Thomas, and acquired title in fee simple to its electric light and power station, operated these public utilities until March 1943. After the end of one year's operation it returned all of the properties to the former owner, The West Indian Co., Ltd.

The increase in income taxes on general business as well as the increased rates and lower exemptions yielded income taxes of \$465,000 in the municipality of St. Thomas and St. John as compared with \$316,000 in the preceding year, an increase of 47 percent. The municipality's total revenues for the year totaled \$693,000 as compared with \$599,000 in the preceding year.

In the municipality of St. Croix, total income tax collections were \$46,900 as compared with \$30,000 in the preceding year, an increase of 55 percent. The total revenues of the municipality of St. Croix were \$194,000 as compared with \$196,000 in the preceding year.

The municipality of St. Thomas and St. John not only operated without a Federal deficit appropriation for the second successive year but, by June 30, 1943, the Treasury of this municipality had collected a surplus of approximately \$80,000 in revenue over budgeted obligations. The municipality of St. Croix operated with a Federal deficit appropriation of \$114,800 which was supplemented by a deficiency appropriation of \$45,000.

There has been little improvement in hospitalization and sanitation conditions in the islands. All medical institutions of the islands continue to be in dire need of rehabilitation and modernization of equipment. The disgraceful system of nightsoil disposal continues to be a most serious menace to the health of the civilian population as well as of the armed forces. The open gutters and sewers in all towns are shockingly offensive. Unfortunately, the correction of most of these conditions must be deferred.

THE PHILIPPINE ISLANDS

The Philippines continued to suffer the effects of enemy invasion. The proclamation of occupation issued on January 3, 1942, Manila time, was followed by the internment of citizens of the United States, Great Britain, and the Dominions, the Netherlands, and most of the Latin-American republics and by the seizure of their property. Philippine citizens and Chinese were allowed comparative freedom of residence, and Japanese were accorded civil rights equal to those of Filipinos.

On January 23, Jorge B. Vargas and some 30 other members of the pre-war cabinet, courts, and legislature, together with prominent Filipino citizens were authorized to form a provisional council of state, and an Executive Commission. The Executive Commission set up a central government under the chairmanship of Mr. Vargas. A considerable number of former bureau chiefs and other governmental personnel appear to have joined the collaborationist movement, undoubtedly in many instances under circumstances of heavy duress.

Intercepted broadcasts revealed that guerrilla warfare was being waged in all the larger islands and that the mass population continued in its loyalty to the United States and to the Commonwealth Government-in-Exile. Japanese and collaborationist efforts to control the economic and social life appear to have met with indifferent success. In May 1943 the Japanese government promised to grant the Philippines "independence within the Greater East Asia Sphere" before the end of the year. In preparation for this step a preparatory committee was nominated. At the same time the liberty of the people was carefully restricted through the organization of neighborhood and district associations under petty native tyrants of Japanese affiliation. All liberal elements were subjected to control and persecution, and efforts were made to crush opposition to the proposed "independence."

The Commonwealth Government-in-Exile under the leadership of President Quezon and Vice President Osmena continued to function in Washington. In line with assurances given in January 1942 from Corregidor, all current financial obligations including interest on the public debt were acquitted. The currency reserve funds on deposit in the United States were kept intact at more than 100 percent of immediate pre-war circulation.

The functions and duties of the High Commissioner to the Philippine Islands were transferred to the Secretary of the Interior by Executive Order No. 9245, September 16, 1942. President Roosevelt accompanied the order with a letter to the Secretary reading as follows:

MY DEAR MR. SECRETARY :

Having decided that under existing conditions Philippine matters can best be administered by a member of the Cabinet in close consultation with me, and that for the present the appointment of a new High Commissioner is inadvisable, I have today signed an Executive order transferring to you for the time being the functions, powers, and duties of the United States High Commissioner to the Philippine Islands, together with the personnel, records, property and funds of the said office.

While the work of the High Commissioner's office has been materially changed in character as a result of military action and the occupation of the Philippines by Japanese forces, we must be ready to deal with the many new problems that will confront us when the enemy is ousted from Philippine soil and final victory is achieved by our forces with the aid of the gallant Philippine people. It may be expected, for example, that transportation will be disrupted, food supply lacking, the money and banking system disorganized, and in many places civil government broken down. Foreign and domestic trade will have to be revived. American and other outside investments in the islands will present complex problems. In short, our duties and responsibilities in the Philippines will be multiplied by enemy invasion and will increase with every month of occupation.

It will be your duty to undertake the conduct of such studies and investigations as may be necessary to enable us to deal with these problems when the time arrives, and to submit recommendations or take such action as may appear necessary as a result of your inquiries. In particular, there should be an immediate inquiry into the financial problems which have ensued as a result of Japanese occupation.

In the conduct of your studies and investigations you will consult with the President of the Philippines and other officials of the Philippine government to the extent that you find it necessary or advisable. You may also call upon other agencies of this Government for advice and assistance.

Under the terms of the foregoing letter, the Office of the High Commissioner was reorganized with a considerable reduction in personnel and assigned the duty of preparing in consultation with Commonwealth officials a generous and effective program for the economic and financial rehabilitation of the Philippines. It is anticipated that upon the defeat of enemy forces much of the physical property of the government will have been destroyed or damaged, the provincial and municipal treasuries will be empty, banks and credit institutions insolvent, the basis of public tax and revenue impaired for several years, and the schools and health service abandoned. The sympathetic and effective assistance of the United States will be required to reestablish the normal political, economic, and social life of the Philippine Commonwealth.

Puerto Rico Reconstruction Administration

BENJAMIN W. THORON, Administrator ¹

THE principal contribution of the Puerto Rico Reconstruction Administration to the war program during the year has been the planting of more than 15,000 acres of lands owned by the Government in food crops. Vegetable marketing cooperatives which were financed and supervised by the PRRA, supplied fresh produce to the armed forces in the island in ever increasing amounts in addition to providing much needed subsistence for the inhabitants of the island. A cotton cooperative has provided substantial quantities of Sea Island cotton required for war purposes. The butyl alcohol plant of the Lafayette Sugar Mill Cooperative has exported more than three and a half million pounds of solvents to the States for the exclusive use of concerns having direct or indirect war contracts. In general, the funds available have required limitation of PRRA activities to the preservation of the social and economic progress achieved and to the protection of investments of the Government, which are valued at approximately \$20,000,000, and were produced by programs of previous years.

FUNDS AVAILABLE

For such purposes the President authorized expenditures by the PRRA during the fiscal year 1943 out of the Puerto Rico Revolving Fund (49 Stat. 1135) on the following projects:

Operation and maintenance of housing projects and facilities-----	\$165,000.00
Management of lands and leases connected with Lafayette project---	87,000.00
Operation of Castaner farm project-----	50,000.00
Supervision of and making and servicing of loans to cooperatives---	250,000.00
General administration-----	109,180.00

¹ By Executive Order No. 8278 of December 4, 1942, Benjamin W. Thoron, Director of the Division of Territories and Island Possessions, was appointed Administrator to serve without additional compensation vice Guy J. Swope, resigned. Guillermo Esteves as Assistant Administrator was continued in active charge of the work in Puerto Rico.

1942 unobligated balance Eleanor Roosevelt Development.....	\$18, 412. 76
Construction of approximately 600 farmers' houses.....	400, 000. 00
Operation Central Service Farms.....	89, 200. 00
To complete certain land purchases.....	5, 000. 00
Subdivision and sale of 900 acres Lafayette grazing lands.....	4, 600. 00
Total.....	1, 178, 392. 76

Adjustments in the amounts of the respective project authorizations were later approved by the President to meet requirements of the overtime pay acts, without changing, however, the aggregate amount of available funds. In addition to the Federal funds, the legislature of Puerto Rico appropriated \$50,000 to the PRRA to assist in the operation of its Central Service Farms.

A summary of the year's principal activities follows:

HOUSING MANAGEMENT

In addition to 1,210 family dwelling units in its 5 low-cost urban housing projects, PRRA has 5,783 rural houses on small subsistence tracts, and 5,326 3-acre parcels without houses which are leased for cultivation to farm laborers at nominal rentals. Most of the rural houses are of concrete construction and termite and hurricane proof; some are brick and concrete; some galvanized iron and some principally of rammed earth. About 200 of the latter type of block houses were constructed during the year. Difficulties in procuring delivery of noncritical materials prevented construction of the 600 contemplated, but the remainder will be built during the fiscal year 1944 out of the unobligated balance in the project which the President has continued in availability for that purpose. Construction during the fiscal year 1943 included completion of 159 units for national defense workers at the Eleanor Roosevelt urban development. As of June 30, 1943, occupancy of urban projects was 100 percent; occupancy of 99.08 percent in 7 rural resettlement areas and 96.11 percent in the remaining scattered rural units. Total rental collections amounted to \$301,600, leaving a substantial net return over and above management, repairs, and other expenses totaling approximately \$180,000.

LOANS TO COOPERATIVES

Supervision, organization and financing of cooperatives has been continued, with particular attention to stimulating activities of the vegetable and cotton cooperatives and to increased production of the butyl alcohol plant previously mentioned. Production of sugar by the Los Canos and Lafayette Sugar Mill Cooperatives will probably

fall 17 percent below the previous year's processing due to lesser cane production attributed principally to shortage of necessary supplies and facilities. Pending regulations of the Public Service Commission of Puerto Rico have also increased obligations by mills to growers for cane transportation charges. Despite other difficulties incident to war conditions, the Los Canos Cooperative promptly met at maturity the installments due June 30 on its loans from the Government, but at this writing the Lafayette Mill has not completed similar arrangements. The Sociedad Agricola which purchases farm supplies for over 3,700 members and patrons sold fertilizer, insecticides, animal feeds, seeds, and other farm supplies amounting to over \$350,000. This cooperative under new management is expected to become an important factor in meeting farmers' needs at reasonable prices. The Vanilla Cooperative has been particularly valuable to growers in the Coffee District by curing and marketing at a favorable price more than 3,275 pounds of vanilla beans.

RURAL REHABILITATION

Operation of the Central Service Farms project with \$89,200 out of the revolving fund and \$50,000 appropriated by the insular legislature, made it possible for PRRA to plant 500 acres in seed beds of subsistence crops. PRRA furnished the land, working animals, machinery, agricultural implements, warehouse and other facilities, and the Work Projects Administration furnished technical direction, laborers, fertilizer, and insecticides. Of the total seed production 10 percent was turned over to PRRA for its planting program, and the balance was used by WPA both for planting and for its school lunch program. In its planting program, PRRA accomplished the planting of approximately 15,000 acres in food crops and 3,000 acres in cash crops in the various small subsistence farms occupied by its resettlers. Thirty-four rural waterworks were operated, furnishing potable water to more than 100,000 persons. Seventeen community centers were operated for the benefit of PRRA resettlers, small farmers and laborers of the surrounding districts. Technical advice and help was given to resettlers to encourage maximum production of foodstuffs. Insular authorities have evidenced their appreciation of the value of PRRA's rural rehabilitation program by a legislative appropriation of \$60,000 and by an allotment of \$212,790 to the PRRA for its planting program from the Insular Emergency Council for the fiscal year 1944.

In the Castaner project 1,200 acres were cultivated in coffee, sugarcane, citron, vanilla and various subsistence crops. The sale of agri-

cultural products brought in more than \$60,000, more than \$10,000 in excess of the amount allotted for operation. Some 200 resettlers' families on 1-acre subsistence plots were provided with work. At Castaner the Director of Selective Service established a Civilian Public Service Camp for emergency medical aid and health education under the direction of the National Service Board for Religious Objectors, with technical supervision of the planning and direction of the work program by the PRRA. The 25-bed hospital which the board established is making a fine contribution to the welfare of PRRA resettlers and their neighbors in both preventive and curative health treatment.

CONCLUSION

For continuation of projects similar to those herein reported, the President has authorized the PRRA to expend \$801,000 in new allotments and unobligated balances of approximately \$250,000 more out of the revolving fund during the fiscal year 1944. This, like authorizations for the fiscal year 1943, will be barely sufficient to protect temporarily the large investments of the Government produced by previous PRRA programs, and to conserve some of the social and economic progress which would be completely lost if the program was entirely terminated. However, if like expenditures should be made in succeeding years, it would not be long before the revolving fund was exhausted. Before that time comes, consideration will be in order as to whether the PRRA should be liquidated or whether other financing should be provided for continuation of the most essential activities in which it has been engaged. In view of the ever-present problem of the island's distressed economy, and the questionable benefit of mere palliative relief expenditures, PRRA's experience has probably demonstrated the advisability of devoting emergency funds, whether Federal or insular, to projects with long-range reconstruction possibilities.

General Land Office

FRED W. JOHNSON, Commissioner

THE mobilization of millions of acres of public lands whose natural resources today furnish vital weapons for the fighting machine of the United Nations and tomorrow will constitute an important segment in the economic life of the United States after peace has been won, was the major objective attained by the General Land Office during the 1943 fiscal year. Under its supervision, tracts of the public domain with a total acreage equalling that of several States, were made available for troop training, aerial bombing and gunnery practice and other military purposes, and more than 70,800,000 additional acres were withdrawn to insure the development and production of strategic war minerals. Still more acres furnished petroleum and other mineral products for military use under the system of public domain leases maintained by the Office.

Valuable timber supplies were provided from 2,500,000 acres of forest lands under General Land Office administration in western Oregon, and the meat ration of combat troops and civilians was augmented by the livestock raising operations and range development work upon grazing sections of the public domain under its jurisdiction.

At the same time, the organization, geared to meet wartime demands for efficiency, carried forward important though less spectacular operations involving the public domain, originally entrusted to it by Congress in 1812. In this field, the identification, recordation, and administration of the public lands in accordance with more than 5,000 public land laws, are performed by the Office as the official real estate agent of the Federal Government.

Despite the increasing volume of these routine duties, many of which were undertaken at the request of other governmental agencies and for their benefit, and despite the added work-load of war-connected activities, the General Land Office during 1943 maintained its position as one of the few executive agencies which operates at a profit to the Federal Treasury. Cash receipts from its activities

totaled \$9,758,066, as against expenditures of \$2,304,416. This ratio of a return of approximately \$4.25 for each \$1 of expenditures, moreover, was achieved in spite of the added costs involved in the establishment and operation of a Branch of Field Examination in the General Land Office, and without taking account of activities which produced no cash return, such as surveying and other tasks performed as utility services for other government agencies and the public. Incidentally, the total cash receipts were the greatest since 1926, and represented the second consecutive year in which the aggregate volume reached more than \$9,000,000.

HISTORIC LAND USE POLICY

The use of the public lands as an auxiliary weapon in time of war and a potent factor in national development in time of peace, conforms to a traditional policy of the United States as old as the Republic itself. After the Revolutionary War, cash sales of such lands helped meet the cost of that war and large tracts were utilized as a bounty payment for military service, in parcels ranging from 100 acres to private soldiers to 1,100 acres for major generals. Generally speaking, similar provisions were made for recognition of military services after the War of 1812, the War with Mexico, and the Indian Wars. Altogether, approximately 61,000,000 acres of the public domain were devoted to the satisfaction of claims based upon military service in these wars.

Although the enactment of the first homestead law in 1862 terminated the era of military land bounty payments, the public domain retained its significance in connection with the Nation's military efforts. Certain settlement preference rights on public lands were extended to ex-servicemen after the Civil War, and that policy consistently has been followed through each subsequent conflict, including the First World War.

Fortified by almost a decade of national conservation, during which the natural resources on the public lands were protected from wasteful dissipation, the United States at the outbreak of the present global war found itself able to contribute more from its public domain treasure houses than ever before in history. While working still within the conservation framework to insure every possible safeguard against misuse of elements needed for the welfare of future generations, the public domain again has been mustered into active service.

As was to be expected, the most immediate contribution from the public domain was in the form of land areas for training soldiers and for the other many uses in modern warfare. Under a program which

was begun before the United States entered the war, more than 15,270,000 acres had been set aside for combat training and other military use at the close of the fiscal year. Including many tracts whose scope and identity still are closely guarded military secrets, a total of 4,703,762 acres were withdrawn for military purposes during the 1943 fiscal year.

In addition, smaller portions of the public domain were made available as sites for defense plants, and to provide housing facilities for war workers. In the latter category, these projects located on public lands in Nevada, California, and New Mexico, made available more than 1,000 units of essential dwelling, dormitory, or trailer housing accommodations.

Studies relating to the post-war administration of these areas and of lands acquired by the Federal Government by purchase, exchange, or other negotiations, for war purposes, were set under way by the General Land Office during the year.

MINERALS MAKE MILITARY MIGHT

Furnishing an increasing and continuous flow of mineral resources from the public domain into the fuel tanks, the ammunition boxes, and the arsenals of the United States was another task confronting the General Land Office during the 1943 fiscal year. Extending beyond the present conflict, its activities embraced steps for self-sufficiency in supplies of the vital mineral products during the Nation's reconstruction period.

An increase by about one-third in the amount of gasoline and butane produced under leases on the public domain was recorded during the year, while the production of oil also was greater than the previous year.

The total cash returns to the United States in 1943 from the Mineral Leasing Act were the highest in 17 years and receipts from all mineral leasing operations reached \$7,790,473, an increase of \$397,427 over last year.

Besides these direct contributions from the public domain, more than 70,800,000 acres were withdrawn for various war uses in connection with the development of strategic minerals, and 43,000 acres were provided under special licenses to defense plants for the extraction of strategic minerals.

As a further aid to the procurement of necessary mineral supplies, plans were formulated and embodied in an order issued by Secretary Ickes on June 9, 1943, for the wider development of potash deposits in the United States. Designed to meet the current and future needs for potash and its associated compounds, previous restrictions upon the

issuance of potash leases were removed to permit the decentralization of sources of potash through production in different areas. The order also facilitates the maintenance of competitive enterprise in the potash industry, and the utilization of this natural resource along safe conservation principles.

O. & C. LANDS FURNISH TIMBER

War demands for specialized types of forest products ranging from heavy timber for piling and shipyard construction to wood for airplane building were partially met in 1943 from the 2,500,000 acres of public domain in the Pacific Northwest which comprise the Oregon and California revested railroad grant lands under the jurisdiction of the General Land Office. Timber sales from these areas, including tracts of Oregon and California lands within national forest boundaries, totaled 485,029,000 board feet, valued at \$1,915,964.

One of the world's largest testing grounds for scientific forestry methods, the Oregon and California lands are administered under policies of sustained-yield management which insure, through reforestation and limitations on timber cutting, a continuous supply of timber for the support of the lumbering communities and industry of the region. At the same time, the program calls for payments of a large part of the proceeds from the timber sales to the 18 Oregon counties in which the Oregon and California lands are located. Under this arrangement, approximately \$976,000 will be paid to these counties from the returns on 1943 sales. Part of this payment constituted final liquidation of a \$2,000,000 debt of back payments owed the counties under earlier legislation involving the O. & C. railroad grant. Original estimates called for the liquidation of this debt over a 10-year period, but so successful have been the financial operations under the O. & C. Revested Lands Administration, that it was wiped out in 1943—4 years ahead of schedule. The amount formerly paid to the counties as back taxes now will be used to liquidate Federal Treasury demands upon the O. & C. lands; eventually, the Oregon counties will receive 75 percent of the proceeds from timber sales in the O. & C. area. Costs of administering these lands continue to be less than 25 percent of gross receipts.

LAND FOR LIVESTOCK

Contributing its share to the supply of food, fiber, and leather for fighting men and civilians, the public domain during 1943 afforded opportunity for the grazing of livestock upon 11,984,939 acres of land outside Federal grazing districts in continental United States and Alaska. These operations carried on under the jurisdiction of the

General Land Office involved 10,151 leases of lands for grazing purposes requiring an annual rental of \$216,485. Of the total, 1,168,954 acres of the leased public domain areas were in Alaska—some in regions now affected by military operations—the remaining 10,815,985 acres being within the continental limits of the United States.

The solution of problems of improvement and maintenance of the range in order that maximum production may be secured for war purposes, also was included within the scope of public domain administration during the 1943 fiscal year. For example, on the Oregon and California Revested Lands, where timber cutting is the primary concern, special effort was made to lease all areas adaptable for grazing use.

Although handicapped by a shortage of manpower and wartime priority restrictions on materials, the Range Development Service of the General Land Office continued work on 139 projects in 10 Western States, involving range improvements, fence construction, development of springs, wells and other stock-watering facilities, and soil and moisture conservation on the public lands. Working in cooperation with the stockmen, the States and counties, and with other Federal agencies, the Service program last year brought substantial benefit to 1,736,917 acres of land. A "work-shelf" of projects which provides for wider development of watering facilities, the reseeding of forage acres, and rodent control work, was planned during the past year and will be begun by the Range Development Service on the public domain as soon as the labor and material supply situation will permit.

LAND CLASSIFICATION AND RESEARCH

One of the features of the national conservation policy which contributed substantially to the accumulation of natural resources available at the outbreak of the war was the stipulation that no disposal would be made of tracts of the public domain until after they had been classified as to the best use to which they could be put. Thus, the identification, classification, and examination of the portions of the public lands which enter into the Nation's military or economic structure forms an important element in General Land Office activities. Although lacking the spectacular aspects of other forms of war work, these activities nonetheless are equally essential to public land administration in war or peace.

Working in close cooperation with the Congress in the study of public land administration problems, we frequently placed the research and statistical facilities of the General Land Office at the service of the Senate and House during the year. Tabulations and textual information were prepared and submitted at the direct request of committees

dealing with public land matters. Included in this material were an inventory of all public lands in Federal ownership in 13 Western States and a detailed report on public land withdrawals which was compiled for the Senate Committee on Public Lands and Surveys.

In addition to its analytical operations, carried on in response to demands from the Congress, the Office rendered expert assistance to other governmental agencies in their consideration of many land management aspects of their work. This form of collaboration was particularly prominent during the year in Alaska, where several bureaus of the Department of the Interior, including the National Park Service, undertook a joint study of administrative problems growing out of the completion of the Alaska Highway.

More specifically, land classification work closely related to the war included assistance to military agencies in connection with land acquisitions and the making and adjustment of withdrawals of public lands for military uses and for air navigation sites both in the United States and Alaska.

Statistical research and analytical studies of paramount importance in evaluating military and post-war problems and their solution were made by the General Land Office during the year. Among these were special tabulations on lands withdrawn for military purposes for the War and Justice Departments, and studies designed to determine the probable food production on the public domain and ways of increasing it in furtherance of the national food-for-war program.

Moreover, methods for carrying resource protection through the war and into the reconstruction period constituted a major task confronting the research and classification branches of the Office. With the trend of national legislation placing particular emphasis upon scientific administration of the public domain, this work, involving such features as townsite and land use planning, and other technical studies, is expected to play a role of ever-increasing importance in the solution of post-war problems.

CADASTRAL ENGINEERING SERVICE

Because no tract of land properly may be set aside for any purpose until its location and boundaries have been accurately determined and permanently recorded, the Government's cadastral surveys have been the basic foundation in negotiations for the disposal, exchange, withdrawal, or other change in the status of the public domain areas since 1796. Differing from the type of survey work which involves primarily the recording of geologic, geographic, or historic features of the terrain, cadastral surveying consists of careful measurement of land areas on the ground, and the recording of such measurements

by the placing of monuments, or other markers, and the preparation of maps scientifically compiled from field notes made by trained engineers at the time of the on-the-ground measurements. First undertaken by the General Land Office when the system of public land surveys decreed by the Continental Congress was transferred to its jurisdiction in 1812, maintenance of a cadastral engineering service has been a continuing responsibility of this Office.

During the 1943 fiscal year, 14 separate agencies of the Federal Government called upon the Service for accurate field surveys of land areas under their jurisdiction, and a total of 2,026,119 acres was covered in the annual work schedules, in addition to many other projects of survey not measurable on a quantitative basis. Surveys conducted at the request of the Army and Navy, the Defense Plant Corporation, Civil Aeronautics Administration and other war-connected agencies resulted in acceleration of the war program. Development of production of potash and sodium in California, magnesium in Nevada, coal in Utah and Wyoming, and timber in Oregon was facilitated by the work of the Service during the year, and housing facilities were made possible for defense workers through townsite surveys in California.

Substantial aid in protecting the public domain from fire losses is afforded by these cadastral engineering activities, because standardized Federal rectangular survey designations enable speedier and more accurate identification and location of threatened areas than metes and bounds measurements.

BRANCH OF FIELD EXAMINATION

The rendering of technical assistance to many agencies of the Government in the solution of their land administration problems brought a heavy 1943 workload to the Branch of Field Examination. This branch completed its first fiscal year as an agency of the General Land Office, following its reorganization by order of the Secretary from its previous status as a departmental division.

Maintaining regional offices in San Francisco; Billings, Mont.; Salt Lake City, Utah; and Albuquerque, N. Mex., with an office at Anchorage, Alaska, the organization includes engineers, geologists, timber and range specialists, experts in land laws and regulations, and other types of experienced personnel.

The war materially affected the field work, and in some regions approximately 50 percent of the problems were of a military nature, and also involved observance of the land laws. Much of this work consisted of investigating the validity of mining claims on sites selected by the Army or Navy for military purposes, and securing the can-

cellation of invalid claims, thus saving the expenditure of funds which otherwise would have been spent in purchasing such lands. In one region these investigations involved a total of more than 4,000 mining claims.

ALASKA

The problem of Alaskan development presents both an immeasurable opportunity for the advancement of civilization along the Nation's only remaining pioneer frontier and a challenge to use of the highest possible standards of public land administration in such development. Because the Territory's total area consists almost in its entirety of public domain, the General Land Office occupies a position of direct responsibility for the proper solution of this problem.

First undertaking that responsibility more than a half century ago with the establishment of the first office in Sitka in 1885, today District Land Offices are maintained in Anchorage, Fairbanks, and Nome, while the District Cadastral Engineer for Alaska is stationed at Juneau. In addition, the headquarters of the Alaskan Fire Control Service and an office of the Branch of Field Examination are located at Anchorage.

Some idea of the problem presented in the Territory may be gained from the fact that the total land area of Alaska, as recomputed for the 1940 Decennial Census is 571,065 square miles or 365,481,600 acres. Of this total, 2,321,304 acres have been surveyed, leaving an unsurveyed area of 363,160,296 acres. The surveyed area represents only 0.6 per cent of the total land area.

Based on the latest computation, the area of vacant, unappropriated and unreserved public domain in Alaska is about 225,000,000 acres. In addition 6,940,698 acres are embraced in national park and monument areas and 20,849,187 acres in national forests. Of the remaining 112,691,715 acres, only a very small portion is in private ownership. The rest is embraced in other forms of public reservations.

ALASKAN SERVICE FIRE CONTROL

The wider development of Alaska will of necessity carry with it broadened responsibilities for fire protection and suppression on the far-flung areas of the public domain in the Territory. This task already has been undertaken by the Alaskan Fire Control Service of the General Land Office, although under financial handicaps greater than those imposed on any similar organization in the entire Government service, considering the fire problem involved.

The magnitude of the protection problem confronting the Service can better be realized by stating that the area under its supervision equals the combined area of the States north of the Mason-Dixon Line

and the Ohio River and east of the Mississippi, and is about 60 percent larger than all the Federal holdings in the national forests of the continental United States. It consists of approximately 40,000,000 acres of fairly dense forests of spruce and birch, 110,000,000 acres of open woodland and interspersed grasslands, and 100,000,000 acres of tundra vegetation in the extreme north and northwest sections of the Territory.

Despite the handicaps of restricted funds and manpower shortage, however, the Alaskan Fire Control Service was able to furnish creditable protective service during the 1943 fiscal year. Substantial cooperation in fire fighting was rendered by the Alaskan command of the U. S. Army.

The reduction in loss of natural resources is of tremendous importance to Alaskans as well as to the Nation as a whole. Besides the saving of valuable timber stands, decrease in burned acreage means less game and wildlife habitat destroyed with consequent less mortality of the wildlife and lessened migration from district to district within the Territory. This is particularly important because during these times of high living costs, sharply reduced transportation facilities, etc., the natives in the more remote sections of the Territory have become even more dependent upon wildlife for their food supply.

ALASKAN SETTLEMENT PROBLEMS

Interest in economic possibilities in Alaska has been increasing for a number of years, and a post-war acceleration of demand for land in the Territory seems inevitable. Not only will members of the armed forces and civilian construction workers become acquainted with the advantages of the Territory, but new road construction, including the international highway, has made Alaska more accessible.

One of the prime requisites for proper development in Alaska is a thorough understanding of the types of public land available for use and the maintenance of a system which will capably and adequately insure the fullest possible utilization of that understanding for the benefit of the Territory as well as for the benefit of the individual settler. Such a system is contemplated under plans which were perfected by the General Land Office during the year for the classification of the public lands in Alaska, and which can be put into operation at the will of Congress.

Classification of the individual tracts of the public lands sought in Alaska will be a significant contributory factor in their successful settlement. Notwithstanding the extent and variety of these lands and the wide opportunity for development, the amount of land in Alaska suitable for present intensive development is not large when

compared with the area of the Territory. Popular concepts of settlement possibilities in Alaska all too often are predicated on inadequate knowledge of widely varying physical characteristics and the sharp and critical climatic differences which exist, and fail to take into account the problem of adequate community services. Thus, classification would help insure the procurement by prospective settlers of lands suited to their needs and guard against entry and selection for inappropriate uses.

Recognizing that this problem would be of immediate concern in connection with portions of the public domain adjacent to the new Alaska Highway, the General Land Office during the year began a series of special studies and field investigations by land classification experts to secure the most efficacious use of the tracts in the post-war period.

POST-WAR PROBLEMS

The mobilization of landpower, like the mustering-in of manpower, brought with it definite problems of administration for solution when peace will have been restored. Many of these questions, obviously, have not yet reached the point of crystallization. However, their potentiality as factors in the post-war public land pattern was given recognition and consideration by the General Land Office consistent with the demands of its current tasks during the year.

Foremost among the subjects requiring careful consideration is that of post-war disposal or administration of lands which have been allocated to military uses. Many millions of acres of public lands withdrawn for military purposes are subject to restoration to the public domain within six months after the end of the war. The fitting of these areas into the peace-time land pattern of the Nation entails problems of administration which the General Land Office is laying plans to meet.

RECOMMENDATIONS

The fighting of a war on the home front, no less than in the battle areas, often reveals inadequate technical procedure or equipment whose replacement or augmentation would be of material aid in both military and post-combat operations. Such a situation frankly exists with respect to some features of public land administration. With a view to assisting in bringing about the desired improved conditions, the following recommendations are made by the General Land Office, based upon its experience in land administration:

1. Developments in the field of mineral resources point to the desirability of revisions in old mining statutes which, while stimulating private enterprise and effort, will safeguard and strengthen the

public interest by providing for economical and efficient operation and the elimination of wasteful practice through effective administration. Mining activities on the public domain, in an effort to meet the war demands for critical and strategic minerals, have served to emphasize the need for the revisions pointed out in last year's report.

Among these revisions would be the enactment of a unified leasing system applying to all minerals not now subject to leasing both in the public domain and in other lands acquired by the Federal Government. These deposits are the property of all the people and should, under proper administrative authority, be made to serve the public weal, rather than be susceptible to wasteful exploitation, as has been possible under conditions as they now exist.

Moreover, new interest in the possibilities of producing strategic and other minerals from public-domain lands has arisen because of the requirements of the war and threats of post-war shortages. Some procedure should be made available, therefore, under which the Government would be enabled to assist private industry in conducting additional exploratory work for minerals on public-domain lands to alleviate these shortages and retrieve any gains from the discovery for the benefit of the public as a whole. Such a procedure would make it economically feasible to carry on much exploratory work not otherwise possible.

2. The increased demands for natural resources to meet military and post-war needs makes complete knowledge and understanding of the character and status of the public lands imperative factors in their proper development and efficient administration. The fact that at the present time evidence of the filing of thousands of unpatented mining claims is not made a matter of Federal record is a serious obstacle to such understanding. The enactment of legislation to enable the filing of such evidence in the General Land Office is urgently recommended.

3. At the present time there is no means available by which accurate, detailed information can be secured concerning the real estate holdings of the various branches of the Federal Government. The establishment within the General Land Office of a centralized, consolidated inventory of all such land records, as a logical supplement to data already in its custody, is recommended as a solution of this problem.

4. Legislative authority for the extension of the protection afforded by land classification to settlement activities in Alaska is of urgent concern. This need is particularly emphasized because of the Alaska highway and other developments which have increased the accessibility and desirability of the Territory to prospective settlers.

5. With world conditions imposing heavy burdens upon our stock of natural resources, fire protection on public-domain lands under the jurisdiction of the General Land Office, both in Alaska and in the continental United States, demands special consideration through the strengthening of present authority and organizational facilities.

6. Greater protection for the public lands and resources and greater efficiency in their administration would be brought about through the enactment of a uniform Federal trespass law.

7. Another year of operation under war conditions has only served to strengthen the need for a careful study, and restatement at the first opportunity, of the multifarious public-land laws under which military and peacetime administration is maintained by the General Land Office.

THE PUBLIC LANDS

Of the total land area of 1,442,267,520 acres in the public-land States and of 365,481,600 acres in the Territory of Alaska, there had been surveyed at the close of the 1943 fiscal year 1,322,903,345 acres in the States and 2,321,304 acres in Alaska. This leaves 119,364,175 acres still to be surveyed by the General Land Office in the States and 363,160,296 acres in Alaska.

As of June 30, 1943, the area of public lands remaining in Federal ownership, including Indian reservations, amounted to about 400,000,000 acres in the public-land States and about 365,000,000 acres in Alaska. Of these, 394,000,000 acres were vacant and unreserved, as follows: 38,000,000 acres in the States outside Federal grazing districts; 131,000,000 acres within such districts; and 225,000,000 acres in Alaska.

The total acreage patented with minerals reserved to the United States increased during the year to 48,505,718 acres, as shown by the following table:

Acreage of lands patented with minerals reserved to the United States, as of June 30, 1943

Type of mineral reservation	Patented during fiscal year 1943	Total patented through June 1943
Reservation of all minerals:		
Under stock raising act.....	1 98, 825	33, 532, 155
Under other acts.....	311, 755	2, 209, 269
Total.....	410, 580	35, 741, 424
Reservation of specific minerals:		
Coal.....	8, 506	10, 854, 583
Others 2.....	49, 989	1, 909, 711
Total.....	58, 495	12, 764, 294
Grand total.....	469, 075	48, 505, 718

1 Includes 2 Indian trust patents (166 acres). 2 Includes coal reserve in combination with other mineral

LEASES AND PERMITS

During the year an additional area of 1,044,298 acres was brought under lease, including mineral licenses and permits, making a total of 15,319,561 acres under lease at the end of the year. The types of leases in force as of June 30, 1943, are shown by the following tables:

Mineral leases, permits, and licenses outstanding as of June 30, 1943

Mineral	Leases		Permits		Licenses		Total

Total.....	10,548	12,170,200.04	221,197.15

¹ Does not include rentals of 2 business site leases, the rentals of which are based on gross receipts.

² Does not include rental of 1 lease, the rental of which is based on receipts.

Homesteads, Sales and Other Entries

Continued decrease in the area of public lands entered and patented is shown by the tables which follow. The totals given indicate a decrease over last year of 53 percent in the area represented by original entries, of 33 percent in the area embraced in entries finally approved, and of 40 percent in the area patented and certified. The number of entries involved, however, declined only 32 percent for original entries and only 1 percent for final entries. The small decreases in final entries as compared to original entries reflects the increasing relative importance of cash entries, most of which are not reported as original entries when initiated. The number of patents issued increased 10 percent over last year, indicating the increasing volume of work involved in the issuance of special types of patents.

compared with the area of the Territory. Popular concepts of settlement possibilities in Alaska all too often are predicated on inadequate knowledge of widely varying physical characteristics and the sharp and critical climatic differences which exist, and fail to take into account the problem of adequate community services. Thus, classification would help insure the procurement by prospective settlers of lands suited to their needs and guard against entry and selection for inappropriate uses.

Recognizing that this problem would be of immediate concern in connection with portions of the public domain adjacent to the new Alaska Highway, the General Land Office during the year began a series of special studies and field investigations by land classification experts to secure the most efficacious use of the tracts in the post-war period.

POST-WAR PROBLEMS

The mobilization of landpower, like the mustering-in of manpower, brought with it definite problems of administration for solution when peace will have been restored. Many of these questions, obviously, have not yet reached the point of crystallization. However, their potentiality as factors in the post-war public land pattern was given recognition and consideration by the General Land Office consistent with the demands of its current tasks during the year.

Foremost among the subjects requiring careful consideration is that of post-war disposal or administration of lands which have been allocated to military uses. Many millions of acres of public lands withdrawn for military purposes are subject to restoration to the public domain within six months after the end of the war. The fitting of these areas into the peace-time land pattern of the Nation entails problems of administration which the General Land Office is laying plans to meet.

RECOMMENDATIONS

The fighting of a war on the home front, no less than in the battle areas, often reveals inadequate technical procedure or equipment whose replacement or augmentation would be of material aid in both military and post-combat operations. Such a situation frankly exists with respect to some features of public land administration. With a view to assisting in bringing about the desired improved conditions, the following recommendations are made by the General Land Office, based upon its experience in land administration:

1. Developments in the field of mineral resources point to the desirability of revisions in old mining statutes which, while stimulating private enterprise and effort, will safeguard and strengthen the

public interest by providing for economical and efficient operation and the elimination of wasteful practice through effective administration. Mining activities on the public domain, in an effort to meet the war demands for critical and strategic minerals, have served to emphasize the need for the revisions pointed out in last year's report.

Among these revisions would be the enactment of a unified leasing system applying to all minerals not now subject to leasing both in the public domain and in other lands acquired by the Federal Government. These deposits are the property of all the people and should, under proper administrative authority, be made to serve the public weal, rather than be susceptible to wasteful exploitation, as has been possible under conditions as they now exist.

Moreover, new interest in the possibilities of producing strategic and other minerals from public-domain lands has arisen because of the requirements of the war and threats of post-war shortages. Some procedure should be made available, therefore, under which the Government would be enabled to assist private industry in conducting additional exploratory work for minerals on public-domain lands to alleviate these shortages and retrieve any gains from the discovery for the benefit of the public as a whole. Such a procedure would make it economically feasible to carry on much exploratory work not otherwise possible.

2. The increased demands for natural resources to meet military and post-war needs makes complete knowledge and understanding of the character and status of the public lands imperative factors in their proper development and efficient administration. The fact that at the present time evidence of the filing of thousands of unpatented mining claims is not made a matter of Federal record is a serious obstacle to such understanding. The enactment of legislation to enable the filing of such evidence in the General Land Office is urgently recommended.

3. At the present time there is no means available by which accurate, detailed information can be secured concerning the real estate holdings of the various branches of the Federal Government. The establishment within the General Land Office of a centralized, consolidated inventory of all such land records, as a logical supplement to data already in its custody, is recommended as a solution of this problem.

4. Legislative authority for the extension of the protection afforded by land classification to settlement activities in Alaska is of urgent concern. This need is particularly emphasized because of the Alaska highway and other developments which have increased the accessibility and desirability of the Territory to prospective settlers.

The decrease in the number and area of entries did not diminish materially the great variety of cases adjudicated during the year.

¹ An original entry or selection is one made in pursuance of an act of the Congress which prescribes the terms and conditions under which patent may be issued or other evidence of title granted. An original entry becomes a final entry upon compliance by the entryman with further requirements of the law, such as residence or additional payment, and upon the issuance of a final certificate. A State selection becomes final upon certification by the Commissioner of the General Land Office.

² Two entries amended.

³ Indian tribal lands.

⁴ Acreage not counted because previously reported.

Land Grants

Pursuant to public policy under which more than 300,000,000 acres of public lands, in addition to rights-of-way, have been granted to local governments and corporations for internal improvements and other public purposes, the General Land Office during the year conveyed title to 134,722 acres of grant lands. Grants to States included 320 acres of desert land (Carey Act), 217 acres of swamp land, 15,788 acres of indemnity school land selections, 109,572 acres of State park selections, 160 acres of reform school selections, and 6,508 acres selected for miners' hospitals. Under the Transportation Act of 1940, which provides for the issuance of patents to railroads to cover grant lands sold by them to innocent purchasers for value prior to September 18, 1940, 2,157 acres were patented to the Northern Pacific Railroad. In addition to these grants, 13 patents were issued to States to give them additional evidence of title to 5,291 acres of previously granted school sections.

Of the 336 applications for rights-of-way for railroads, irrigation, telephone and telegraph lines, public roads, pipe lines, and other purposes approved during the year, 163 involved permits or easements with an annual rental of \$3,690 and 12 were temporary rights-of-way over O. & C. lands producing an annual rental of \$140.

Land Exchanges

Exchanges of land with private owners resulted in the addition of 79,910 acres to grazing districts in exchange for 22,415 acres of Federal land, 2,773 acres to a migratory bird refuge in exchange for 3,121 acres; 721 acres to Indian reservations in exchange for 680 acres, and 223,795 acres to national forests in exchange for 24,202 acres of land plus sufficient timber to equalize the values involved.

Exchanges of lands with States under the Taylor Grazing Act made on an equal basis amounted to 183,073 acres.

Receipts and Expenditures

Receipts during the year totaled \$9,758,066, the highest since 1926, while expenditures from appropriations amounted to \$2,304,416. Rentals, royalties, and bonuses from mineral leases and permits accounted for 80 percent of the total receipts and sales of timber from O. & C. and Coos Bay lands for an additional 16 percent. Fees and commissions and sales of public and Indian lands which prior to the Mineral Leasing Act constituted the bulk of receipts from the public lands, amounted to less than \$200,000.

Pursuant to the provisions of various laws, 40 percent of the total receipts will be distributed to the various States and counties and 43 percent will be credited to the Reclamation fund. Indian trust funds will be credited with \$8,901.

The following table shows the receipts earned during the year, by sources and by Treasury accounts.

Disposition of receipts of the General Land Office,¹ fiscal year 1943

Source of receipts	Covered in the Treasury earmarked for—

³ Includes \$17,076.59 collected in Wyoming under act of June 26, 1926 (44 Stat. 1621), \$10,107.15 collected in Alaska, and \$106,944.48 collected in California under Executive Order No. 9087 dated March 5, 1942.

⁴ Includes \$270,060.04 as final payment under act of July 13, 1926 (44 Stat. 915).

⁵ Estimated.

⁶ Range improvement fund.

Office of Land Utilization

LEE MUCK, Assistant to the Secretary

THE Office of Land Utilization is charged, under Administrative Order 1466, dated April 15, 1940, with the responsibility of coordinating and integrating the land-use and land-management activities of the several bureaus and agencies of the Department; the establishment and development of sound forestry practices; the general administration of soil and moisture conservation work; and the maintenance of cooperative relations with the Federal, State, and private agencies concerned with the protection, conservation, and prudent use of the land and natural resources of the United States and Alaska.

The advent of the war necessitated a reorientation of the activities of the agencies of the Department having control over natural resources. Without endangering gains already made in the management of the Federal estate or in any way compromising the conservation aims of the Department, the Office of Land Utilization has, during the fiscal years 1942 and 1943, given first attention to directing coordinated land-management programs so as to increase timber production and to augment the quantity and quality of products from western range lands. Increased amounts of timber, food, and other raw materials now are flowing directly into war channels from forest, range, and other types of lands under the supervision of the Department of the Interior.

In recognition of the requirements of the war, action has been taken toward the restriction of developmental activities to those that are urgently essential to a maintenance of existing values and to the highest possible contribution to the effective prosecution of the war. A discussion of the principal programs in progress on Department of the Interior lands, with which the Office of Land Utilization is directly concerned, follows.

FOREST MANAGEMENT

The forest resources under the jurisdiction of the Department of the Interior are so located and so well developed that substantial contributions to the prosecution of the war were made possible during the fiscal year 1943. Shortly after Pearl Harbor, the Department of the Interior set up a production goal of 1 billion feet board measure of timber to be utilized from the Oregon & California Railroad and Coos Bay Wagon Road grant lands and from the Indian forests. Timber-cutting was increased immediately, and the sale of additional timber was authorized both from Indian and from O. & C. lands.

During the year a total volume of 432,302,000 feet board measure, having a value of \$1,315,541, was cut from the O. & C. forests. Thus, for the second consecutive year, the sustained-yield capacity of 500 million feet board measure per annum, prescribed by the act of August 28, 1937 (50 Stat. 874) was approached. One hundred and seventy-one new timber sale contracts on the O. & C. lands were entered into during the fiscal year 1943 covering a total volume of 485,029,000 feet board measure, for which purchasers contracted to pay a total of \$1,915,964. The cost of administration and protection on the O. & C. lands for the fiscal year 1943 was \$262,463, which, compared with the cash receipts for that period of \$1,580,328, reflects a ratio of cost to income of about 17 percent.

This contribution to the prosecution of the war was accomplished without deviating from the departmental policy of preventing destructive methods of logging and by providing for early restocking of areas in the process of development and the furtherance of the ideal of cooperative sustained-yield management between the O. & C. lands, the private owners of adjacent lands, and local mills.

The sales of timber from Indian forests also were increased during the fiscal year 1943, thereby providing a substantial increase in the income received from these forests. As on the O. & C. lands, the operations on Indian lands were conducted in full accordance with the departmental conservation policies. The conservation aspects of good forest management were in no way subordinated to the utilization program.

SOIL AND MOISTURE CONSERVATION OPERATIONS

The Soil and Moisture Conservation Operations of the Department of the Interior are conducted pursuant to the provisions of the Soil Conservation Act and Reorganization Plan No. IV. The program is coordinated by the Office of Land Utilization with a view to obtain-

ing a unified objective and eliminating overlapping and duplication of effort. However, in recognition of the principle that this function can be best performed by the agencies administering the land, field operations are conducted by the six land-management agencies of the Department.

An appropriation of \$1,340,000 was authorized for the fiscal year ended June 30, 1943, and since this was substantially less than the amount of \$2,178,700 authorized for the fiscal year 1942, soil and moisture conservation operations on the Federal estate were greatly reduced. As a result the program was entirely reorganized with a view to concentrating upon the more critical areas and promoting the highest possible degree of production consistent with the limited funds available for the vast area in need of rehabilitation.

The state of erosion which exists on lands administered by the Department of the Interior requires corrective action on approximately 60 million acres, or about 21 percent of the total area under management. Extensive areas have been depleted of their natural vegetative cover and sheet erosion has, in many cases, removed a large volume of the top soil. Restoration of the vegetative cover through range reseeding operations and control of the use of the land through water development, fencing, and the application of sound land-use management practices constitute the principle measures being applied. However, some of the areas have been so seriously eroded that the application of more intensive methods of control are essential, regardless of the inadequacy of the appropriation made available.

Since the lands under the jurisdiction of the Department of the Interior are being intensively used for grazing and other purposes, it has been the policy of the Department to promote a high degree of cooperation with the users of the land. The great majority of these permittees and lessees are fully aware of the need for soil and moisture conservation work on the public lands and have cooperated to the fullest possible extent in the prosecution of the program. The cooperation received has resulted in the contribution of money, services, labor, and materials from private individuals; the contribution of funds by the States; adjustments in operations on intermingled privately owned lands; and the assumption of responsibility for the maintenance of the projects by the users of the land. The value of the contributions received has been estimated at approximately one-quarter of a million dollars for the fiscal year 1943, which amount when considered with the value of the good will secured in the promotion of conservation practices, reflects a substantial accomplishment.

The approved work program of the Department for the fiscal year 1943 covered operations on 267 projects in 18 States. Extensive areas

were reseeded to species of adaptable vegetation, and a large number of water facilities were installed to insure an even distribution of the livestock on the range; diversion ditches were constructed with a view to providing flood-water irrigation; rodent-control operations were performed on thousands of acres; drift and division fences were constructed where absolutely necessary, and gully-control measures applied above irrigation projects. The results accomplished, when considered in the light of the limited funds available, can be viewed with a high degree of satisfaction and clearly demonstrate that the application of practical low-cost measures can be made highly productive.

WHITE PINE BLISTER RUST CONTROL

There are within the lands administered by the Department of the Interior 682,583 acres of valuable white pine stands which require protection from the white pine blister rust—a fungus disease of foreign origin which became established in this country 30 years ago. This disease is fatal to white pines, including three of the most valuable timber trees in the United States, namely: the eastern white pine, the western white pine, and the sugar pine. The purpose of white pine blister rust control operations is to protect these valuable pines by the eradication of *Ribes* (currant and gooseberry bushes), the alternate host of the disease.

Under the provisions of the act of April 26, 1940 (54 Stat. 168, 169), all white pine blister rust control appropriations for Federal lands are combined in one appropriation item carried in the annual appropriation for the Department of Agriculture. For the fiscal year 1943, \$174,910 was appropriated for this work on Department of the Interior lands and made available to the National Park Service, the Office of Indian Affairs, and the O. & C. Lands Administration of the General Land Office.

Progress of the control work on Department of the Interior lands has been slow and barely has kept abreast of the spread of the disease. During the calendar year 1942, 24,671 acres were worked for the first time and 6,481 acres were reworked. As of January 1, 1943, 360,630 acres had received initial eradication, or 53 percent of the total acreage requiring protection.

PROTECTION OF FORESTS, FOREST INDUSTRIES, AND STRATEGIC FACILITIES

With \$779,600 provided by the Sixth Supplemental Appropriation Act of 1942 and \$95,900 by the Interior Appropriation Act of 1943, the

emergency fire protection program of the Department was continued during the year. This program, made necessary by the war, provides emergency fire protection for the forest and range resources, forest industries, and strategic facilities situated on the forest, brush, and grasslands of the Department located within a 300-mile zone of the Atlantic and Pacific coasts and the Gulfs of Mexico and California.

It is estimated that there are 364 million acres of forest, brush, and grassland under the jurisdiction of the Department requiring protection from fire. Approximately 272 million acres (47 million in the continental United States and 225 million in Alaska) of this area need special protection by reason of the war. The lands requiring emergency protection are administered pursuant to congressional enactment by five agencies of the Department, namely: the Grazing Service, the General Land Office, the Office of Indian Affairs, the National Park Service, and the Fish and Wildlife Service.

These lands support some of the finest stands of virgin timber and a major portion of the best publicly owned range lands in the United States. On the lands under the administration of the Department in the 11 Western States are 2,608 military, industrial, transportation, communication, power, water, and mining facilities of strategic importance to the war.

It is a major responsibility of the Department to protect from fire, sabotage, and other hazards all forest, brush, and grass resources and associated strategic facilities located on or adjacent to lands under its jurisdiction. Forest or range fires not only would materially damage or utterly destroy the renewable natural resources but might interfere with the operation of strategic facilities, thereby becoming a real hazard and deterrent to the war program.

The emergency fire-protection program of the Department is not a duplication of existing protection activities afforded through regular appropriations but is an intensification of normal fire protection. The program provides for the employment of approximately 500 fire guards stationed in critical areas where past experience has indicated the fire risk was high and the hazards great and where quick fire-suppression action is imperative in the prevention of heavy losses and damage.

As a corollary to the main program, action was taken during the year to strengthen cooperative plans between the action agencies of this Department with action agencies of the Department of Agriculture. A formal memorandum of understanding providing for permanent coordinated action in fire control was approved by the Secretaries of Interior and Agriculture in January 1943.

The fire season for the calendar year 1942 was decidedly encouraging. Favorable weather played a relatively large part in holding losses to a minimum, but the fact that organized and trained guards were made available through the emergency fire protection program assisted materially in holding acreage losses to a low level. During the calendar year 1942 the action agencies of the Department reported 3,316 fires which burned over 1,879,613 acres of federally owned lands. This loss is approximately one-half of 1 percent of the total area requiring protection.

JAPANESE RELOCATION COMMUNITIES

Acting pursuant to Executive Order 9102, dated March 18, 1943, which established the War Relocation Authority for the purpose of relocating Japanese evacuees, the Secretary of the Interior and the Director of the War Relocation Authority entered into agreements providing for the location of Japanese communities on lands under the jurisdiction of the Department of the Interior. Agreements were entered into covering lands within the Tule Lake Reclamation project, California; the Minidoka Reclamation project, Idaho; the Heart Mountain Reclamation project, Wyoming; the Colorado River Indian Reservation, Arizona; and the Gila River Indian Reservation, Arizona. The evacuee communities located upon these lands had a total evacuee capacity of 71,000 Japanese, and lands totaling approximately 122,000 acres were authorized to be made available for development by and the use of these people during the duration of the war.

The Assistant to the Secretary in Charge of Land Utilization was designated to represent the Department in its negotiations with the War Relocation Authority incident to the settlement of the Japanese evacuees upon lands under the jurisdiction of the Department. Land-use permits covering practically all of the projects were executed and approved by the Secretary during the fiscal year ended June 30, 1943, thus largely completing the liaison responsibility with the War Relocation Authority so far as the execution of agreements and permits for the use of Department of the Interior lands is concerned.

CIVILIAN PUBLIC SERVICE CAMPS

Under date of March 12, 1943, the Secretary informed the Director of the Selective Service System that the Office of Land Utilization would henceforth represent the Department in all matters pertaining to the operation of work camps for conscientious objectors assigned to this Department.

Under the authority of the Selective Training and Service Act of 1940 (Public, No. 783, 76th Cong.), the Director of the Selective Service System was authorized to establish projects of national importance to which may be assigned persons found under section 5g of the act to be conscientiously opposed to participation in combatant and noncombatant training and service in the land or naval forces of the United States. Under this authority the Director of the Selective Service System authorized the organization of certain camps on Department of the Interior lands. At the end of the fiscal year there were 10 active camps assigned to the action agencies of the Department as follows: National Park Service, 5; Fish and Wildlife Service, 1; General Land Office, 1; and Bureau of Reclamation, 3. Of the three camps assigned to Reclamation projects, the camp at the Mancos project, Colorado, is the first fully Government-operated Civilian Public Service camp authorized by the Selective Service System. Entire responsibility not only for the work program but also for the feeding, housing, clothing, care, and discipline of the assignees has been assumed by the Bureau of Reclamation.

The work of these camps was slightly revised during the year to place more emphasis upon forest and range protection, a project of vital national importance. All camps are now being utilized principally for fire protection and for projects having a direct relation to the protection and conservation of the natural resources of the Nation.

LAND-DEVELOPMENT PROGRAMS

Although the Office of Land Utilization has been concerned largely with activities directly related to the war during the past fiscal year, the large volume of work accomplished in that field has not prevented the carrying on of effective planning looking to the conservation and fuller utilization of the Federal lands under the jurisdiction of the Department of the Interior. Working in close cooperation with the National Resources Planning Board and the Department of Agriculture, a reservoir of land- and resource-development projects has been assembled; many of these have been carefully evaluated and given a high priority rating; and a well-rounded program will ultimately be available for prosecution in the event the construction of public works is authorized for the stabilization of employment after the termination of hostilities.

The formulation of post-war land and resource programs is largely the responsibility of the Departments of Agriculture and Interior, and steps have already been taken for the establishment of a high degree of cooperation and the securing of unified action in that field. The

The fire season for the calendar year 1942 was decidedly encouraging. Favorable weather played a relatively large part in holding losses to a minimum, but the fact that organized and trained guards were made available through the emergency fire protection program assisted materially in holding acreage losses to a low level. JAPANESE RELOCATION COMMUNITIES

Acting pursuant to Executive Order 9102, dated March 18, 1943, which established the War Relocation Authority for the purpose of relocating Japanese evacuees, the Secretary of the Interior and the Director of the War Relocation Authority entered into agreements providing for the location of Japanese communities on lands under the jurisdiction of the Department of the Interior. Agreements were entered into covering lands within the Tule Lake Reclamation project, California; the Minidoka Reclamation project, Idaho; the Heart Mountain Reclamation project, Wyoming; the Colorado River Indian Reservation, Arizona; and the Gila River Indian Reservation, Arizona. The evacuee communities located upon these lands had a total evacuee capacity of 71,000 Japanese, and lands totaling approximately 122,000 acres were authorized to be made available for development by and the use of these people during the duration of the war.

The Assistant to the Secretary in Charge of Land Utilization was designated to represent the Department in its negotiations with the War Relocation Authority incident to the settlement of the Japanese evacuees upon lands under the jurisdiction of the Department. Land-use permits covering practically all of the projects were executed and approved by the Secretary during the fiscal year ended June 30, 1943, thus largely completing the liaison responsibility with the War Relocation Authority so far as the execution of agreements and permits for the use of Department of the Interior lands is concerned.

CIVILIAN PUBLIC SERVICE CAMPS

Under date of March 12, 1943, the Secretary informed the Director of the Selective Service System that the Office of Land Utilization would henceforth represent the Department in all matters pertaining to the operation of work camps for conscientious objectors assigned to this Department.

Under the authority of the Selective Training and Service Act of 1940 (Public, No. 783, 76th Cong.), the Director of the Selective Service System was authorized to establish projects of national importance to which may be assigned persons found under section 5g of the act to be conscientiously opposed to participation in combatant and noncombatant training and service in the land or naval forces of the United States. Under this authority the Director of the Selective Service System authorized the organization of certain camps on Department of the Interior lands. At the end of the fiscal year there were 10 active camps assigned to the action agencies of the Department as follows: National Park Service, 5; Fish and Wildlife Service, 1; General Land Office, 1; and Bureau of Reclamation, 3. Of the three camps assigned to Reclamation projects, the camp at the Mancos project, Colorado, is the first fully Government-operated Civilian Public Service camp authorized by the Selective Service System. Entire responsibility not only for the work program but also for the feeding, housing, clothing, care, and discipline of the assignees has been assumed by the Bureau of Reclamation.

The work of these camps was slightly revised during the year to place more emphasis upon forest and range protection, a project of vital national importance. All camps are now being utilized principally for fire protection and for projects having a direct relation to the protection and conservation of the natural resources of the Nation.

LAND-DEVELOPMENT PROGRAMS

Although the Office of Land Utilization has been concerned largely with activities directly related to the war during the past fiscal year, the large volume of work accomplished in that field has not prevented the carrying on of effective planning looking to the conservation and fuller utilization of the Federal lands under the jurisdiction of the Department of the Interior. Working in close cooperation with the National Resources Planning Board and the Department of Agriculture, a reservoir of land- and resource-development projects has been assembled; many of these have been carefully evaluated and given a high priority rating; and a well-rounded program will ultimately be available for prosecution in the event the construction of public works is authorized for the stabilization of employment after the termination of hostilities.

The formulation of post-war land and resource programs is largely the responsibility of the Departments of Agriculture and Interior, and steps have already been taken for the establishment of a high degree of cooperation and the securing of unified action in that field. The

work to be accomplished consists of: the completion of the 6-year programs and the analysis and consolidation thereof for budget purposes; the inauguration of surveys and investigations and the preparation of detailed plans which will make it possible to initiate construction when funds are made available; the establishment of project priorities and the development of alternative lists designed to meet varying conditions with respect to the size of projects, timing, and degree of employment to be provided; and the coordination of Interior Department programs with those of other Federal departments and States with a view to eliminating duplication and conflict.

A soundly conceived land- and resource-development program is an essential part of public works expenditures designed to stimulate a high level of employment and production. A substantial part of such a program will be largely self-liquidating through the establishment of a maximum degree of production and increased returns from the resources under management. The future is unpredictable, but it seems clear that the value of the land and its resources will continue to increase and that the maintenance thereof at a high level of production is essential to the future of the Nation. Consequently, the formulation of land-improvement programs, as briefly outlined above, is a major responsibility of management organizations, and the successful prosecution thereof is definitely in the public interest.

Grazing Service

R. H. RUTLEDGE, Director

PEAK demands for meat, wool, hides, and mohair during the fiscal year 1943 confirmed the wisdom of range conservation principles fostered by the Taylor Grazing Act of 1934, and the Grazing Service pushed its program in every quarter to increase supplies of these products without overgrazing the range. In close cooperation with producers and with war agencies, the energy of the Service was shifted to activities that would help carry the fight to the enemy. One of the grazing district advisory boards expressed the feeling of the range livestock industry by a resolution in these words:

Be it resolved that as the progress and duration of the war make necessary additional and greater sacrifices in the lives of all, we stand ready to subordinate all to the prosecution and winning of the war, and with this high resolve we pledge full cooperation.

Range improvement work was cut to bare essentials, while the construction of access roads to strategic mineral deposits and land activities for military needs gained in momentum as the year advanced.

War is wasteful of resources, and to keep them in and on the ground merely for the purpose of saving them will not help to save lives, but when victory is won replenishment of resources will be in order. In giving principal attention to the immediate goal, consideration was also given to the job that lies ahead. Plans to repair and improve the range and to furnish post-war employment were revised and kept current.

Believing that more "home ranch" feeding will shorten the time between the range and the cooler and speed up consumer supplies, as well as bring livestock numbers down to the safe winter carrying capacity of range and ranch, the Grazing Service is encouraging the producer to finish for slaughter as much range stock as possible.

No public agency can hope to accomplish its broader objectives under changing conditions without the support and cooperation of

those who are most directly affected. Stockmen using Federal range supported the food program, and in many cases made drastic adjustments in order that adequate public land could be set aside for aviation and other military training.

Despite wartime difficulties, the livestock industry has undertaken its current task of greater production through increased weight and quality of livestock. Such means as improved methods, better range management, reduction of mortality losses, streamlined procedures, and labor-saving devices wherever feasible were employed, and the Grazing Service encouraged these efforts by liberalizing established rules and policies where that was necessary in order to attain this end.

A survey of the results to date indicates a prospect for increased meat supplies from the Federal range to the extent of 85 million pounds in the calendar year 1943 and of 124 million pounds in 1944. The turn-off of livestock products from the Federal range in 1942 was estimated at 800 million pounds of meat and 80 million pounds of wool. In addition there were produced large amounts of mohair and horse meat.

Funds.—Congress appropriated \$839,300 for Grazing Service salaries and expenses. Funds allotted for range protection and improvement totaled \$830,776; for construction of access roads, \$924,500; for liquidation of CCC, \$121,000; for miscellaneous purposes including advisory board contributions, \$210,802.86. This represents a decrease in operating funds of \$651,951.08 from the previous year.

Liquidation of CCC.—Grazing Service CCC camps were closed and the Corps was liquidated during the year. Many of the experienced foremen and engineers were reemployed on the construction of access roads.

Grazing fees.—Earned grazing fees totaled \$785,140.77 in 10 States, of which \$329.22 is for the credit of Indians and \$392,405.78 is made available to the States affected under the provisions of the Taylor Grazing Act. State revenues from this source for the 8-year period, 1936–43, now total \$2,655,117.47. Distribution of 50-percent fund payments to 10 States for the fiscal year 1943 and for the years 1936–43—the latter in parentheses—are: Arizona, \$17,662.09 (\$131,019.12); California, \$10,314.80 (\$83,822.83); Colorado, \$22,544.41 (\$160,280.21); Idaho, \$35,035.80 (\$264,794.00); Montana, \$26,587.53 (\$109,521.73); Nevada, \$65,285.42 (\$407,841.92); New Mexico, \$59,699.58 (\$419,887.04); Oregon, \$27,795.21 (\$193,770.43); Utah, \$71,286.55 (\$509,653.54), and Wyoming, \$56,194.39 (\$374,526.65). The above States contributed \$107,617.35 to the Secretary in 1943 to be used for range improvements under State and Federal law, bringing the amount contributed to date for such purposes to \$504,660.98.

Personnel.—Despite a 48-hour week occasioned by the overtime act, considerable unrecorded additional hours both in field and office were necessary to keep pace with expanded war activities and added work load occasioned by unprecedented personnel turn-over. Reduction in positions in conformance with Senate Joint Resolution No. 170 totaled 28. The number of positions voluntarily allowed to lapse as an economy measure was 36. Authorized positions were reduced from 462 to 398, a net reduction of 64. At the close of the year, the clerical, administrative, and technical staff, of whom 153 are women, totaled 385 employees, leaving 13 authorized positions temporarily unfilled. In addition, there were 595 district advisers intermittently employed at the call of the regional graziers. Three hundred eighty-five employees were engaged in the construction of access roads. In addition, 230 temporary and wage employees were engaged in other seasonal activities.

Training.—By means of staff conferences, discussions, and memoranda, an endeavor was made to familiarize employees, especially the younger groups, with policy and procedure, and to keep all employees in step with the tempo of war. In counseling programs three main points were stressed: (1) the job must be done, (2) no alibis, and (3) only victory workers can bring victory. Observing these principles, the organization advanced toward the main objective.

Equipment and supply.—Procurement of priority materials consistent with war needs was held to a minimum in conformance with the governmental requirements plan established by the War Production Board. About 70 percent of the former CCC property was transferred and distributed to the military. Much of the heavy equipment went to the Alaskan Highway. Certain equipment, not considered vital to the military, was retained on loan and used for access roads and fire control. As the year advanced it became increasingly necessary to rent a number of tractors, graders, jackhammers, and compressors from private sources.

Nonessential driving was eliminated, travel was minimized, and whenever possible, official trips were made by common carrier or by pooling of official cars. Passenger-carrying automobile mileage was reduced 45 percent from that of the previous year.

Salvage.—By gathering everything from obsolete rubber stamps to tractor parts, and by cooperation with local salvage committees in 200 counties, a total of 14 million pounds of rubber and scrap metal was turned over to appropriate authorities. Surplus top grade material turned over to the Treasury Department included 941 tires and 1,094 tubes.

those who are most directly affected. Stockmen using Federal range supported the food program, and in many cases made drastic adjustments in order that adequate public land could be set aside for aviation and other military training.

Despite wartime difficulties, the livestock industry has undertaken its current task of greater production through increased weight and quality of livestock. In counseling programs three main points were stressed: (1) the job must be done, (2) no alibis, and (3) only victory workers can bring victory. Observing these principles, the organization advanced toward the main objective.

Equipment and supply.—Procurement of priority materials consistent with war needs was held to a minimum in conformance with the governmental requirements plan established by the War Production Board. About 70 percent of the former CCC property was transferred and distributed to the military. Much of the heavy equipment went to the Alaskan Highway. Certain equipment, not considered vital to the military, was retained on loan and used for access roads and fire control. As the year advanced it became increasingly necessary to rent a number of tractors, graders, jackhammers, and compressors from private sources.

Nonessential driving was eliminated, travel was minimized, and whenever possible, official trips were made by common carrier or by pooling of official cars. Passenger-carrying automobile mileage was reduced 45 percent from that of the previous year.

Salvage.—By gathering everything from obsolete rubber stamps to tractor parts, and by cooperation with local salvage committees in 200 counties, a total of 14 million pounds of rubber and scrap metal was turned over to appropriate authorities. Surplus top grade material turned over to the Treasury Department included 941 tires and 1,094 tubes.

Office management.—All regions suffered heavy losses in experienced personnel, especially in key positions such as accounting and property clerks. The turn-over of clerks in one region was 100 percent and averaged 50 percent in the field as a whole, resulting in reduced volume and quality of essential paper work. Field audits were completed in only 3 of the 10 regions. Fiscal work was kept current, but if all books, records, and reports are to be maintained and examined in accordance with standard requirements one additional auditor should be employed.

Analyses of 55 of the 58 grazing districts on a job load basis are now complete. The clerical work load was analyzed in two regional offices in order to furnish a basis for required reports to the Bureau of the Budget.

Wartime use of the Federal range.—Public Law 586, Seventy-seventh Congress, approved June 5, 1942, authorizes the Secretary of the Interior to dispose of timber and other products of the public lands through sale or lease, on terms prescribed by him, for use in connection with the manufacture of arms, ammunition, and implements of war or the production of equipment, supplies, and materials usable in such manufacture. To date approximately 400,000 acres have been affected by this legislation. The Grazing Service assisted war agencies in the solution of numerous land problems such as appraisal work under the act of July 9, 1942. Joint examinations of areas proposed for military use have resulted in withdrawals to date of 3½ million acres and the issuance of special-use permits on 12 million acres within grazing districts. Additional areas outside of grazing districts were examined upon request and the results were forwarded to the appropriate military authorities for consideration.

Several examples of special-use permits may be cited. One in Idaho is typical. In that State a certain range needed for gunnery practice is used part of each year by 175 ranchers operating 230,000 sheep and 1,000 cattle. The area was divided into two units, one being grazed by livestock during the period and the other used for gunnery range. At the proper grazing season the gunners and the stockmen exchanged areas, resulting in full service for both types of use. In this way normal production of livestock was maintained and trigger fingers were kept in shape for more serious business abroad.

Certain eliminations of livestock from scenes of urgent military operations were necessary. One such area affected 47 livestock operators and involved 8,421 cattle, 618 horses, 12,432 sheep, and 10,681 goats. In the aggregate, however, 484,000 sheep and 15,905 cattle still graze on Federal range that is also used for military purposes. The Grazing Service assisted the War Department in the

establishment of compensation values to ranchers, as provided by the act of July 9, 1942.

Mine roads.—Hidden in the ground are untold resources which are essential to the war program. Among these are minerals and other strategic materials. To stimulate the movement of such materials from mine to mill, Congress authorized the expenditure of 10 million dollars for the construction of access roads under the Defense Highway Act. The Grazing Service was among the agencies selected to do this type of work. Arrangements were made for regional officers to receive applications from owners and operators of small mines, and very soon thereafter 509 projects had been processed, and construction of roads leading to deposits of about 30 different types of strategic minerals was under way. At the end of the year 782 miles of access roads had been completed at a total cost of \$792,092.87. As a result, thousands of additional tons of copper, lead, zinc, manganese, vanadium, tungsten, chromium, and mercury had been mined, moved, stock-piled, and much of it milled and shipped to war industry plants. A certain road to vanadium deposits reduced travel time 300 percent and within 6 months the tonnage of ore delivered to reduction plants had been increased tenfold. New supplies of coal, iron, and timber were also tapped.

Status of grazing districts.—During the year 783 applications which involved action under sections 6, 7, 8, and 14 of the Taylor Grazing Act, the Five-Acre Lease and Homestead Act, and the Enlarged and Stockraising Homestead Acts were received. Eight hundred and twelve such cases were disposed of and 301 were pending on June 30. Six special motion-picture permits were granted, and permits to remove timber for domestic use were granted to 636 individuals. These authorized the removal of 62,000 fence posts and 5,500 cords of wood.

Despite the number of internal changes that took place in grazing districts during the year, there was no change in the gross area and but slight change in the total area administered by the Grazing Service. The statistical detail is shown on Table I.

Range development.—In modifying the program in the interests of war, no large range improvement projects were undertaken. Maintenance of existing improvements was stressed; all new structures were considered carefully before installation from the standpoint of increased meat production. Even small projects were postponed unless it was determined that they would contribute to more tons of livestock and its products, nor were projects undertaken if more than a nominal amount of critical materials was needed in their structure. It is estimated that through these activities 2 million acres of formerly

undeveloped grazing land were brought under economic use. Water development to facilitate range use and management, reseeding, maintenance of fences and trails to control and handle livestock, and control of predatory animals, rodents, insects, and poisonous plants, featured this part of the program. Fences and trails saved thousands of man-days of the producers' labor, an important factor in the solution of manpower shortages. Truck trails eliminating expensive stock drives enabled producers to put their livestock on the market faster and in better condition.

On table II are shown the major range improvements completed during the past year and the amount completed since the inception of this type of work in 1935.

Range protection.—Grazing districts are social and economic units occupied by 2 million persons who live on farms, ranches, and in towns, and who earn their livelihood from the land in the face of great odds. The chief range hazard is fire. Grass fires move fast requiring prompt attention. About 90 million acres in grazing districts are in high hazard zones. The danger to crops, buildings, forage, and watersheds is increasing because of more abundant grass on the Federal range and the intense activity, especially military. Many fires are caused by incendiarism or by carelessness. There is constant danger from fire on bombing practice ranges. Last year 1,128 range fires burned 1,734,992 acres in grazing districts, reducing precious tons of livestock feed to smoke and ashes. Seventy-seven percent of these fires were man-caused. Lightning-caused fires were largest and most destructive. To meet this situation every means of prevention and suppression is undertaken. The Grazing Service is steadily improving its fire-fighting technique through better communications, education, and cooperation. About 3,000 local per diem guards, who are paid only when called, are in active cooperation. Several dispatchers and lookouts, engaged during the fire season, are in close contact with field offices effectuating constant patrol in high hazard areas during periods of fire danger. Through cooperation with the Army within bombing areas, military ground crews are on the alert, equipped with tools and mobile units which enable them to get to a fire promptly. Trained fire bosses operate in each region under the general direction of a fire supervisor who is centrally located. Cooperation with States, agencies, and with the forest fire fighters service is effective and profitable.

Miscellaneous service.—The location of Army engineering units in Salt Lake City enabled the drafting office of the Grazing Service to contribute specialized work on the reproduction of plans for housing, airfields, sanitation, and other urgent military projects to

the extent of 37,500 square feet of process printing and 70,000 square feet of photocopy, at a great saving of time and money to the military.

Post-war planning.—The Six-Year Range Development Plan initiated 2 years ago was revised and enlarged to create a reservoir of useful work to help cushion the shock of sudden change from a wartime to a peacetime economy. This revised plan will enable the Grazing Service to implement work projects within 3 months after victory, which may employ 15 million man-days of labor on 50,000 small projects of 13 major types in 10 Western States. Distributed over 200 sparsely populated counties where small crews can be employed near their homes, the proposed plan will require largely common labor employed mainly on water development, erosion control, fencing, trail building, revegetation, and fire protection.

Preliminary studies have been completed in one State to integrate the Grazing Service plan with post-war State and Federal Works programs. Similar studies are now underway in 9 other Western States.

Hearings and appeals.—During the fiscal year 236 appeals from decisions of local administrators were filed, of which 103 were disposed of through local action. Ten decisions, after formal hearing, were appealed to the Secretary. These involved 41 grazing applications and licensees. One hundred thirty-three appeals were pending hearings at the close of the year.

Food for war.—Stockmen are thoroughly alive to their responsibility as producers of products for war, seeking every means to maintain production at a high level and to hold the conservation gains made during previous years. Labor difficulties and other conditions in certain localities caused a shift in livestock operations from sheep to cattle, but the grazing load on the Federal range was only slightly changed by this trend. Reports from permittees indicate a definite increase in weight and quality of animals marketed. Losses from predatory animals increased. More attention must be given to this problem.

As a part of the Secretary's "Food for War" program, the Grazing Service explored all possibilities in an effort to increase the amount of meat and wool for immediate and future needs. The methods adopted include better range management, reduction of death losses, harvest of surplus game animals, eradication of predatory animals, rodents, and poisonous plants; removal of useless horses, and increased grazing use wherever possible.

Rodent control was conducted on 1,726,300 acres; useless horses were removed to the extent of 25,273 head. Predatory animal control re-

sulted in saving about 3,000 calves and 85,000 sheep and lambs. Plans were laid to take 50,000 to 60,000 additional deer, elk, and antelope from grazing districts. This will account for an additional 5 million pounds of meat and will reduce winter death losses of game herds. Areas depleted by fire and other causes during the preceding years were reseeded to the extent of 166,292 acres.

Soil and moisture conservation.—This work, designed to benefit both public and private land, was carried forward under the President's Fourth Reorganization Plan on 51 projects initiated in previous years and on 11 projects initiated during the fiscal year 1943. Through this work large areas of range formerly underused or not used at all, were brought into beneficial and economic use, while congestion in other parts of the range was relieved to an equal extent.

Range surveys and studies.—Range surveys were completed on only 4,473,133 acres during the year, stress being given to other work more closely connected with war programs. Cooperative nutritional studies to encourage ranch fattening and better management of livestock were conducted in Oregon at the Squaw Butte Range Station and on selected areas in other States.

Federal Range Code.—The revised Federal Range Code, clarifying and simplifying administrative procedures dealing with the internal affairs of grazing districts, was approved by the Secretary September 23, 1942. The new code affords greater flexibility to meet widely varying conditions of the Federal range.

Trespass.—Steps were taken to eliminate from the range all useless and trespassing horses in conformance with the "Food for War" program and the Secretary's order of March 10, 1943. Stockmen are co-operating in gathering surplus horses prior to the effective date of the order. During the second half of the fiscal year out-shipments increased threefold over the same period of 1942. Sheep and cattle trespass increased slightly because of attractive livestock prices and an insufficient range-rider force.

Wildlife.—Big game in grazing districts increased approximately 13 percent over the previous year, totaling approximately 500,000 head. There was an increase in predatory animals, especially coyotes. To save vital food products and to reduce financial losses to the industry, advisory boards expended \$24,712.30 in 1943 for predator control in 14 grazing districts. A total of 47,194 predatory animals were eradicated during the fiscal year.

Utilization checks.—The system of utilization checks developed during previous years was maintained to check and record range use, and to guide the stockmen and administrators in the maintenance of

proper use on allotted ranges. A total of 12,367,233 acres was covered by such examinations during the year.

Licenses and permits.—The number of regular licensees and permittees increased from 21,249 to 22,019, a gain of 770, involving 10,777,-793 livestock of all classes. This represents a decrease of 190,343 head, but the grazing load was approximately the same as that of the previous year, due to the trend to fewer sheep and more cattle. The cattle numbers under licenses and permits increased 54,191 head, while the sheep decreased 201,084 head. The statistical detail is shown by States in Table III.

In addition, 1,655 temporary part-season War Emergency licenses were issued, involving 69,893 cattle; 3,888 horses; 197,314 sheep, and 150 goats; adding only 1.3 percent to the total grazing load while enabling owners to shape their plans for more meat production.

Ten-year term permits were issued to 4,490 operators during the year, bringing the total to 10,600, or about 50 percent of all users operating on a license basis a few years ago. Permits include definite range allotments which are agreed upon by all interested parties. This marks another forward step in the stabilization of the livestock industry.

TABLE I.—Status of grazing districts, approximate acreages as of June 30, 1943

State	Number of districts	Gross area	Vacant, unappropriated unreserved public land	Other public land	Total administered by Grazing Service	Other land •
Arizona.....	4	18,171,400	9,100,688	819,879	9,920,567	8,230,833

National Park Service

NEWTON B. DRURY, Director

THE reduced wartime staff of the National Park Service is engaged in the task of making definite contributions to the war program, and at the same time continuing to protect the irreplaceable cultural resources conserved within the national parks and monuments. Thoughts of America's future after the war may well be associated with the basic purpose of the National Park Service, which by mandate of the Congress is to "conserve the scenery and the natural and historic objects and the wildlife" in the areas it administers, and to provide for human enjoyment of them "in such manner and by such means as will leave them unimpaired for future generations." Justification for this purpose, which was well established before the Service was created in 1916, is found in the conviction that only by complete protection from commercial use or exploitation can these special areas fulfill their highest value to the Nation. They make up less than three-fourths of 1 percent of the land area of the United States.

To harmonize the Service's objectives with war uses of the areas for which it is trustee, the criteria cited in the 1942 annual report have been consistently applied. These tests involve the thought that inconvenience to park administration and to visitors, or remediable damage to park property, are not considered sufficient reason for denying uses of park facilities and resources that would not be considered appropriate under peacetime conditions. Only where proposed uses would do irreparable damage and entail destruction or impairment of distinctive features and qualities in the parks have the questions been raised: Have all reasonable alternatives been exhausted before invading the national park areas? Is the demand based upon critical necessity? The Service has cooperated to the full with war agencies in seeking the answers to these questions. The military authorities have shown full appreciation of the Service's position.

There are those who under the cloak of patriotism would reopen old issues as to the exploitation of lands which Congress and the American people have decreed should be held inviolate for the national good. But national park lands and policies have so far been fully protected from the activities of those who might, designedly or unconsciously, attempt to use the war as an excuse to raid them.

The national parks and monuments are vital American institutions that have their proper place in our national life. They are a segment of the Federal estate that has been chosen for preservation so that this and future generations will see the untamed America that was, and understand the compelling influence that built and strengthened this Nation. We cannot lightly abandon them, or the idea that gave them being, although we may have to sacrifice both in part at least if compelled to do so by the needs of war.

The importance of the national park areas to our people is attested by the fact that during the year 8,228,220 visitors, of whom more than 1,655,720 were members of the armed forces, turned to them for inspiration and relaxation, and to gain deeper appreciation of this land of ours.

THREATS TO CONSERVATION

The necessity for forest products has intensified since last year's report. Particularly is this true in the Pacific Northwest where the supplies of Sitka spruce, the most suitable material for certain types of aircraft construction, are running short.

It appears evident that, if the war lasts several years, all of the readily available airplane spruce in Oregon and Washington will be exhausted. In that event, a more complete transition to the use of substitutes, or fuller use of more remote commercial stands of spruce, will have to be made. In view of the national importance of the last remnants of the once vast virgin spruce and fir forests of the Northwest, it may fairly be asked whether the alternatives should not be exhausted *before* rather than *after* the forests in Olympic National Park are destroyed and an outstanding natural spectacle lost to America forever.

Critical necessity rather than convenience should be the governing reason for the sacrifice of such an important part of the Federal estate. If Olympic National Park is opened to the logging of Sitka spruce to meet war needs for aircraft materials, there will exist great danger that pressure to widen this breach will be injected by local interests to maintain local industries after the war is over. That issue was considered by the Congress and definitely decided on a basis of national good when Olympic National Park was established.

There has been considerable agitation to cut the mature trees within national parks on a selective logging basis. The proponents of such action miss entirely the main point of national park philosophy, for they fail to realize that the removal of any portion of the forest under any system of logging, however restrictive, disrupts the balance of nature, and is contrary to the very principles upon which the national parks and monuments were established. Once logging is introduced into an area, it no longer exists as a superlative virgin forest.

With the greatly increased demand for lumber to meet war needs, the cutting of forests on private and national forest lands was intensified, so that responsibility for the preservation intact of representative areas of the magnificent virgin forests of this Nation rests more than ever upon the National Park Service. Of the once extensive forests that covered the continental United States, there still exist approximately 630,000,000 acres of forested land. Of that amount, approximately 1 percent is contained within the national parks and monuments. That is a small fraction to hold inviolate according to the national park pattern. Surely there is ample justification for the consensus among conservation leaders that the forests in the national parks should not be invaded, unless the trees are absolutely essential to the prosecution of the war with no reasonable alternative.

As proposals to mine certain critical minerals in the national parks and monuments have been received, the Service has taken the position that such invasion can be justified only when it would furnish materials indispensable to the war and not obtainable in sufficient quantities elsewhere. This policy has been taken into consideration by war production agencies in connection with studies made in the national park areas.

As was the case during World War I, growers of livestock urgently demanded grazing privileges in many of the areas of the National Park System. In order to answer these demands, a study was made of all areas throughout the system and increases in grazing allotments in certain types of areas were authorized as an emergency contribution to the food-production program. However, the study substantiated the basic policy that grazing is detrimental to the preservation of natural forest, meadow, and wildlife conditions, and that it should not be allowed in national parks and monuments of the "wilderness" type.

This study revealed that the total lands which are administered by the National Park Service and which are suitable for grazing constitute but one-seventh of 1 percent of the grazing lands in the United States—an infinitesimal amount when compared with the Nation's food supply. Other evidence clearly demonstrates that grazing is severely detrimental to the flora and fauna that are such important parts of the

balance of nature present in the national parks and monuments. Park properties subjected to grazing during the last war were damaged out of all proportion to the small increase in the food supply attained.

MILITARY USES

The Army and Navy have continued to use national park and monument lands for varied military purposes. On the part of military authorities there has been shown a spirit of cooperation and understanding of Service objectives and a recognition of the need for the preservation of natural and historic values. This was borne out in two important instances. At Joshua Tree National Monument, California, desert warfare training units extended a road across the Monument, and at Hawaii National Park extensive training and defense installations were made. When the damage to natural features was reviewed with Army authorities, immediate steps were taken to locate suitable alternative areas and to repair the damage. Practically all of the national park and monument areas along the Pacific, Atlantic, and Gulf Coasts, because of their strategic location, are being used for defense installations, such as the large number of aircraft warning service posts installed by the Army, or for training purposes. Yet no important park values are being destroyed, and in many cases military needs are being served in conjunction with park-protection activities.

The Navy Department, in June 1943, took over the Ahwahnee Hotel in Yosemite National Park, California, as a convalescent center. This unique hostelry is serving its highest purpose in wartime by furnishing an ideal environment in which members of our naval forces may regain their health.

The Eastman Hotel and Bathhouse at Hot Springs National Park, Arkansas, was purchased by the War Department for use as a hospital in connection with the Army and Navy Hospital.

All types of equipment for Arctic warfare were tested in advance of quantity production by the Army's Quartermaster Corps at Mount McKinley National Park, Alaska, because this was the only reasonably accessible place in North America which would afford Arctic conditions in summer. Various kinds of tests of equipment and clothing were also conducted at Shenandoah, Mount Rainier, and Yosemite National Parks.

The national historical parks, military parks, and historic sites of the East made their principal contributions to members of the armed forces as laboratories for the study of military activities. In the early stages of the development of the national military parks and battlefields following the War Between the States, the greatest care was

taken by Confederate and Union participants to mark carefully the movement of troops and to report accurately, without praise or censure, the events that took place on these battlegrounds.

A familiar sight during the past year has been the activity of officers from the Quantico Marine Base, Virginia, carrying on field studies of the First and Second Battles of Bull Run in Manassas National Battlefield Park; or troops from the A. P. Hill Reservation tracing the route of march of Stonewall Jackson on the battlefield of Chancellorsville.

A considerable portion of Petersburg National Military Park, Virginia, formerly a part of Camp Lee, was again returned to Army jurisdiction. Lands adjoining Fort Oglethorpe in the Chickamauga-Chat-tanooga National Military Park are serving as camps and training grounds for some members of the Women's Army Corps.

The engineering laboratory which had been engaged principally on testing materials for the Bureau of Yards and Docks, United States Navy, was lent in August 1942 to the U. S. Engineers. To facilitate their operations, all laboratory equipment was transferred to a temporary wooden building at one of the Army field stations. On December 25, 1942, this structure burned to the ground, completely destroying all of the laboratory equipment. The U. S. Engineers will replace the destroyed equipment after the war when specialized laboratory apparatus and equipment of this type are again manufactured.

Thousands of dollars worth of equipment were turned over to the armed forces by the National Park Service. A typical example is the snow-removal equipment, conservatively valued at \$150,000, which was made available to clear Army airfields of snow during the winter months.

With the spread of Army and Navy training centers throughout the Nation, the commanding officers and members of the armed forces have come in increasing numbers to the national parks and monuments. There were almost three times as many military visitors in the fiscal year 1943 as there were during 1942. Travel reports from 122 areas indicated approximately 1,650,000 members of the armed forces visited those areas in the fiscal year ending June 30, 1943.

Many Army bases in the West and Southwest combined recreation with training in convoy operation and preventive maintenance. Not only the driving of convoys over mountain roads, but also establishing of overnight bivouacs and field practice were beneficial, and far-reaching effects upon the mental attitude of these members of the armed forces resulted from their seeing some of the greatest aspects of the America that they are fighting to preserve.

The desert warfare training camps in Arizona and southern California organized maneuver-recreation trips to Grand Canyon National Park. There on the South Rim one of the former CCC camps was renovated and equipped to accommodate them. Mount Rainier and Olympic National Parks in the State of Washington were the "objectives" of many soldiers from Fort Lewis and other camps in that area, who had completed their training and were awaiting orders to be transferred to war zones, while Yosemite and Sequoia National Parks in California served thousands of nearby military personnel. Opportunities for such visits were made honor awards in many of the camps.

Mount McKinley National Park in Alaska is being enjoyed by the soldiers stationed in the northern battle zone. The McKinley Park Hotel, operated by The Alaska Railroad, was turned into a recreation center where soldiers are given vacations that afford some respite from the experiences of the battles they fought along the Aleutians.

There is significant justification of the national-park concept in the fact that increasing thousands of members of the armed forces are being given opportunities they never had before, and may never have again, to see the inspiring beauty and historical significance of this land of ours.

CONTRIBUTION TO WAR PRODUCTION

As the tempo of the United States' participation in the war increased, there came increasing demands upon the National Park Service for wartime use of the areas that the Service administers and of the resources that these acres contain.

During the fiscal year 448 such requests were received, and of these 403 were approved. The 45 which proposed operations that would have done material damage to natural or historic features were returned and alternatives were suggested that would meet military needs without destroying important park and monument objects.

Most of the war uses authorized were for facilities and areas formerly open to the public, and simply involved change in the type of use. For example, the main through roads in Yellowstone National Park, the Blue Ridge, Natchez Trace, and George Washington Memorial Parkways were opened to military trucking on a temporary emergency basis. Such direct damage to roads as may occur will be repaired when normal travel is resumed and trucking has been discontinued.

In order to cooperate to the fullest extent in relieving the shortage of tannin extract materials, dead chestnut extract wood on a portion

of the Blue Ridge Parkway was advertised for sale. The forests involved are not of virgin character and the future plans for parkway development provided for the removal of a part of this dead chestnut.

Upon the recommendation of the War Production Board, it was necessary, as a contribution to the war program, to permit the sale of some urgently needed Sitka spruce and Douglas fir within the Queets Corridor, between Olympic National Park and the Pacific Ocean, which had been acquired for parkway purposes. The timber to be removed, amounting to approximately 4,000,000 board feet, was marked with great care on a selective basis so as to leave a forest canopy. Immediately along the prospective parkway the forest was left practically untouched. The lands within the Queets Corridor are not a part of Olympic National Park and, therefore, are not protected by the prohibition against commercial logging which applies to national park lands. It is recognized, however, that even this selective logging along the Queets Corridor entails a sacrifice of primeval forest conditions and future parkway values in the interest of the war.

To meet the need for war purposes of minerals that are becoming critically scarce, it has been necessary to make certain departures from national park policy. As a contribution to war production, the Defense Plant Corporation, a Government agency, was authorized to extract salt from Death Valley National Monument, California, to meet immediate requirements for scheduled operations at the Basic Magnesium Plant near Las Vegas, Nev. Between June 2 and July 31, 1942, more than 15,000 tons of salt were removed from the monument. Meanwhile, investigations of other sources proved to be successful and brought to a close the operations within the monument. It will be many decades before nature can gradually soften the scars and restore the picturesque salt pinnacles that were destroyed by these operations.

A valuable deposit of tungsten within Yosemite National Park was mined by the Metals Reserve Co., a Government agency, upon recommendations of the Geological Survey, Bureau of Mines, and War Production Board that it was essential.

Army and Navy contractors removed approximately 130,000 tons of sand and gravel from Rialto Beach, Olympic Acquisition Area, Washington, and approximately 45,000 tons from Sitka National Monument, Alaska.

Permission to build a short-cut road through a portion of Mount McKinley National Park, Alaska, was given to the owner of an antimony mine which will permit shipment of approximately 700 tons of crude ore and concentrates during the summer of 1943.

Operators of manganese mines adjacent to the boundary of Olympic National Park were permitted the use of park lands for building low-standard truck trails to reach nearby existing highways. In order to facilitate production of important minerals at Death Valley National Monument, four access roads across monument lands were constructed to sources of manganese, lead, tungsten, and talc.

To help in some degree to meet the critical need for food and fiber during the war period, increases from approximately 20,000 head of cattle to 25,000 head, and from 74,000 sheep to 82,600 sheep were authorized on certain national monuments, recreational demonstration areas, and historical areas. There was no increase in the major national parks. A small amount of grazing still exists in 10 national parks and a considerable amount in 33 national monuments and other areas. In approving this wartime step, the Secretary of the Interior reaffirmed the long-established policy of gradual decrease and ultimate elimination of grazing in national parks and monuments.

An incidental contribution to the Nation's meat supply was made through the necessary reduction of the northern elk herd of Yellowstone National Park. Disposal of Government-killed elk (691 animals) was made to 11 Indian agencies and to the Montana Fish and Game Commission in accordance with arrangements which were made to have the meat used for domestic consumption. Hunters outside of the park killed 7,230 elk. It is estimated that the elk-reduction program resulted in 1,789,000 pounds of meat being made available for human use.

The Yorktown Historical Museum in Colonial National Historical Park was remodeled into a post office to help meet the needs of the greatly increased population in that wartime center. The administration and museum building of Boulder Dam National Recreational Area was turned over to the Bureau of Reclamation and municipal authorities to remodel into a hospital for the workers in war plants in and surrounding Boulder City, Nev.

About 8½ million pounds of scrap metal, mostly iron and steel, were collected in the areas administered by the Service and contributed to the scrap metal drive. At the same time, following request of the War Production Board, a survey was made of the nonferrous metal contained in the statues, historical cannon, and other mementoes. It was learned that there was a total of about 985 tons of nonferrous objects of all sorts in the national parks. While this was done to assist the War Production Board in calculating the potential war resources of the Nation, the National Park Service took care to point out that these historic objects and memorials are part of our national heritage which should be preserved inviolate until all other sources of scrap

metal have been exhausted. The Salvage Division of the War Production Board acceded to this view, as did the Office of the Chief of Ordnance, and it was agreed that cannon antedating 1865 and other historic objects should not be scrapped. Indeed, the Office of the Chief of Ordnance displayed willingness to save from the scrap pile such historic cannon as might come into their possession. As a result, the National Park Service was able to secure from the War Department a number of Burgoyne cannon for Saratoga National Historical Park, New York, and a fine old cannon for Castillo de San Marcos National Monument, Florida.

Lands which form a part of the National Capital Parks in the District of Columbia provided sites for defense installations and for the buildings required to provide working space for the thousands of men and women engaged in war duties in the Nation's Capital. The lands involved have an appraised value of \$24,300,000. The cost to the Federal Government of purchasing alternative sites would undoubtedly have exceeded that amount. While the withdrawal of these lands curtailed the amount of open space in downtown Washington and the recreational opportunities so important in an overcrowded city, such uses were held to be inescapable. Associate Director Arthur E. Demaray, as the liaison officer in Washington, D. C., has performed important public service in connection with this problem. It is the hope of those who have worked to make Washington the most beautiful capital in the world that all temporary structures will be removed at the end of the war much more rapidly than was the case with their predecessors of World War I.

The use of National Park Service areas and facilities, the expert services frequently provided by its administrative, technical, and construction staff, and the occasional use of minerals and other natural resources, are estimated to amount in value to date to more than \$30,000,000.

TRAVEL

The critical condition of the Nation's transportation systems, the drastic shortage of rubber, and the lack of gasoline and oil for other than essential civilian consumption, have called for discouragement, rather than encouragement, of civilian travel. All motor transportation engaged in sightseeing services in the national parks was stopped. Motor bus trips not absolutely essential were eliminated and many of the busses were transferred to war work. Only direct bus service between rail and bus terminals and accommodations within the parks was allowed by the Office of Defense Transportation. This authorized

service was used by many thousands of visitors in July, August, and September 1942.

By June 1943, the travel situation had become so critical that even the reduced hotel and transportation services were discontinued in many places. Railroads were unable to put on special supplemental trains, and all reduced summer rates as an incentive to vacation travel were eliminated. Only through trains were operated and, with connecting bus service curtailed or discontinued, there were drastic reductions in the number of civilian visitors to the national parks. There were practically no winter visitors to Mount Rainier, Crater Lake, and Lassen Volcanic National Parks, because snow removal equipment had been loaned to the Army Air Forces and the roads were not kept free of snow.

Travel to the national parks as a whole has not stopped, however, nor were they closed to visitors. Services and accommodations were adapted to the varying needs as they developed under rapidly changing conditions. Concessioners under contract with the Department continued to furnish limited services to the public. It was necessary for the Department of the Interior to discourage civilian use of transportation resources involved in long-distance travel. Civilians not close by found it difficult or impossible to visit the parks.

National parks remote from centers of population, such as Acadia, Bryce Canyon, Crater Lake, Glacier, Grand Canyon, Grand Teton, Mesa Verde, Shenandoah, and Yellowstone, received less than 25 percent of their normal travel. The largest losses compared with the 5-year average were to Acadia, 98 percent, and to Shenandoah, 93 percent. The cumulative totals of travel to all of the national parks and monuments reflect a reduction of 50 percent in comparison with the 5-year average for the years 1938 to 1942.

In Hawaii National Park, the lifting of the restrictions on civilian travel resulted in a 20 percent increase above the normal number of visitors, with 386,185 people visiting the park during the past fiscal year. This is an indication of the advance planning that must be done now to take care of the large number of persons who will want to visit the national parks as soon as travel conditions permit.

The Statue of Liberty National Monument, New York, nearly attained its normal travel with a total of 320,750 visitors making the pilgrimage to this outstanding symbol of liberty. It was also the scene for patriotic rallies and services broadcast throughout the world.

Among the national parks there was a notable increase in the number of persons who came and stayed for their full vacation period. To Yosemite National Park, California, in June 1943, for example, came 17,195 persons who stayed for a total of 77,900 visitor-days. The average stay per visitor at this park has more than doubled since the

outbreak of war. Increased use of the public campgrounds was also reported from Lassen Volcanic National Park, California, and numerous other areas.

Notwithstanding the handicaps of traveling under wartime conditions, many thousands of persons were willing to take coach trains, use what gasoline they had for their automobiles, ride horseback, travel by wagon, propel a bicycle, or walk, in order to seek a few hours or days of relief from war tension in the environs of the national parks and monuments.

Park officials report that from July 1, 1942, to June 30, 1943, approximately 6,572,500 civilians in addition to 1,655,720 members of the armed forces visited the areas administered by the National Park Service. Thousands of workers transferring to war plants took advantage of opportunities to visit parks and monuments en route. Several areas did not report visitors because of lack of personnel to keep the necessary records or for reasons of military censorship, which in some degree is responsible for decrease in the total travel figures.

PROTECTION OF PARK FORESTS

Although the forests in the National Park System are not commercially available for production of the raw materials of war, nevertheless they are among the possessions that this Nation is perpetuating in order that future generations may know and appreciate in some measure the native, virgin forests which once covered a large portion of the United States. Their proper protection in wartime is a responsibility of first magnitude.

Forests cannot be set aside like inanimate objects. They are living entities, the elements of which are born, grow, mature, reproduce, and eventually die like all other living things. During this cycle they are subjected to all the hazards of nature. Against many of these elements man's efforts would be futile, but against fire, tree diseases, forest insects, the excessive inroads of man himself, the battle must go on if the national park forests are to be preserved "for the benefit and enjoyment of the people."

To the normal problem of fire protection, an acute threat of sabotage and enemy incendiaryism was added. This, and the withdrawal of many trained fire fighters from the forest, necessitated intensification of training, keener analysis of fire problems, and a thorough revitalization of the fire protection organization.

In recognition of extreme fire hazard, areas within 300 miles of the coast were included within the allocations of national defense funds for fire protection of forests, forest industries, and strategic facilities.

Five Civilian Public Service camps, consisting of approximately 100 men each, were assigned to work primarily on white pine blister rust control, but were available for fire suppression. They were located at Shenandoah, Great Smoky Mountains, Glacier and Sequoia National Parks, and the Blue Ridge Parkway.

During the year, there were 402 forest fires affecting national park areas, a decrease from the previous year of 25 percent. The total area inside the National Park System burned during 1942 was 4,415 acres, a decrease of 85 percent from the previous year. This included 3,224 acres of forest, 512 acres of brush, and 679 acres of grass. Over 25 percent of the total acreage burned resulted from a series of lightning fires in Yellowstone National Park.

Credit for the 23 percent decrease in the number of man-caused fires, and the relatively small acreage burned, is attributable to the intensive fire prevention campaign which has been waged and to the fire training programs.

Recent studies of past fire causes revealed that the tourist was responsible for 47 percent of the total number of park man-caused fires, while 53 percent were caused by people who live or work in or near the parks. Fire-prevention efforts, therefore, were directed to a greater degree toward this class of person than heretofore.

The forest insect situation in the National Park System was generally favorable as a result of previous intensive control programs. A small amount of maintenance control operations held most insect infestations in check. Continuing vigilance and prompt control of minor outbreaks are required to forestall epidemics such as those which have swept over vast forest areas in the past.

White pine blister rust, a serious exotic disease, which attacks the eastern and western white pines, including the magnificent sugar pine of the West, has continued to spread. Approximately 382,740 acres of pine forest in the national parks warrant intensive control work. The intensified control program, initiated last year by the appropriation of special funds, was carried forward in 1942 with an additional 9,660 acres added to the previous 262,740 acres which have received initial control. The Bureau of Entomology and Plant Quarantine of the United States Department of Agriculture furnished excellent co-operation and technical assistance in carrying out this program in the parks.

PROTECTION OF WILDLIFE

Basic wildlife studies have been continued on a limited scale by service personnel. The loss of Civilian Conservation Corps wildlife technicians, curtailment of regular personnel, and reductions in funds

greatly restricted the research and advisory work done by the Fish and Wildlife Service in the National Park System, but cooperative relationships with that bureau were continued by the small staff of experts in its section on National Park Wildlife.

Thirty-three projects were undertaken during the year, including investigations of range limitations, boundary surveys based on ecological considerations, wildlife-cattle relationships, management plans for reduction of bison, elk, and deer in certain areas, field surveys in connection with plans for reintroduction of antelope, beaver, and other members of the native fauna of some parks and monuments, bear-visitor studies, and predator-prey investigations.

The long-planned reduction of the northern herd of Yellowstone elk was initiated in the fall of 1942. Experience indicated that live-trapping and removal would not solve the problem, primarily because available ranges outside of the park appeared to be fully stocked with elk. Satisfactory results were achieved through a combination of slaughter within the park, and adjustment by the State authorities of the hunting season outside the park. By January 14, 1943, when the Montana hunting season was closed, 7,230 elk had been eliminated from the northern herd, 691 of which were killed by park rangers within the park. This was the first systematic program carried out in a national park to effect a large-scale reduction of surplus animals. Its purpose was to bring the northern herd in Yellowstone National Park within the limits of the winter food supply and to save the herd from starvation. A census taken at the close of the reduction program showed that more than 8,000 elk remain in the northern herd. Range studies indicate that not more than 7,000 elk in addition to other grazing and browsing animals can be supported by the forage available.

Bears were live-trapped and taken to remote sections of Yellowstone, Yosemite, Glacier, Mount Rainier, Crater Lake, and Sequoia National Parks to remove them from areas of intensive human use. Artificial feeding of bears was stopped in order to remove the inducement to bears to concentrate in specific areas and to induce them to return to normal methods of foraging. Efforts were made to impress the public with the necessity of treating bears as wild animals. One person died after being injured by a bear at Yellowstone National Park. Although there have been many serious injuries to visitors at the park, this is the first and only instance in which a fatality has ensued.

In order to control the increasing population of bears, and to eliminate those which are dangerous to human beings, 87 of these animals were disposed of by park rangers in Yellowstone, Yosemite, and Crater Lake National Parks. The number of bears in the national parks and monuments is estimated at 2,544 black bears and 510 grizzly bears.

ADDITIONS TO NATIONAL PARK SYSTEM

Jackson Hole National Monument, Wyoming.—This monument was established by Presidential proclamation on March 15, 1943, thus bringing to a head a program that was initiated in Wyoming almost 20 years ago. Grand Teton National Park, established by the Congress in 1929, and Jackson Hole, which adjoins it to the east, have long been famous for their majestic scenery. The two areas bear as close a relationship to each other as do the cliffs and valley floor of Yosemite National Park. The preservation of this great landscape as a national treasure, a place which better than any other symbolizes the fur trading and pioneering eras in America's history, an area wherein earth-building processes are displayed in spectacular form, and as an outstanding nature sanctuary, had been urged as a project of importance to the Nation for half a century.

The so-called "Jackson Hole Plan" was originally sponsored by local, State, and Federal interests as a means of realizing the benefits to the Nation of perpetuating the significant characteristics of this area for the enjoyment of this and future generations. Nearly 15 years ago, Mr. John D. Rockefeller, Jr., became interested in the "Plan" and volunteered to purchase portions of the area for national park purposes. This year, after having invested over \$1,500,000 in the project, and having waited 15 years for his gift to be accepted, Mr. Rockefeller requested that conclusive action be taken. As 76.9 percent of the land was in public ownership and 15.2 percent was owned by Mr. Rockefeller, a combined total of 92.1 percent, the President's Proclamation establishing the national monument assured protection and unified administration of the major part of the area. The proclamation protects all valid existing rights on the 7.9 percent of lands in private ownership. By an administrative order, the Secretary of the Interior continued certain privileges previously enjoyed by the local people on Federal lands and has given assurance that all private rights will be protected.

Nevertheless, there developed misconceptions that people would be deprived of their homes and livestock enterprises, that Teton County would be ruined because of loss of taxes, and that other economic changes to the detriment of the community would result. As a consequence, House Resolution No. 2241 was introduced by Congressman Frank A. Barrett of Wyoming calling for the abolishment of Jackson Hole National Monument. Hearings were held on the bill by the House Public Lands Committee in Washington and, during the summer recess, members of the committee plan to make joint investigations

in Wyoming with members of the Senate Committee on Public Lands and Surveys.

Thomas Jefferson National Memorial, Washington, D. C.—The Thomas Jefferson National Memorial, at the Tidal Basin in Washington, was dedicated by President Roosevelt on April 13, 1943, the two hundredth anniversary of Jefferson's birth; thus rededicating the Nation to the ideals of this great exponent of our democratic faith in political and religious freedom, educational advancement, and opposition to every form of tyranny over the human mind.

The memorial building derives its inspiration from the Pantheon at Rome, which so fired the enthusiasm of Jefferson that he used it as the model for the Rotunda of the University of Virginia. In the center is the model for the statue of Jefferson by Rudolph Evans which will be completed after the war.

Independence Hall National Historic Site, Philadelphia, Pa.—By cooperative agreement with the city of Philadelphia, Independence Hall was designated as a national historic site by the Secretary of the Interior on May 14, 1943. The Declaration of Independence was adopted by the Continental Congress in Independence Hall. It was also the meeting place of that Congress and of the Constitutional Convention of 1787, and the seat of Government of the United States during the American Revolution and during the period of 1790–1800.

Olympic National Park, Washington.—At the request of the people of Port Angeles, Wash., and local officials, 20,600 acres, known as the "Morse Creek Watershed," were added to the park by Presidential Proclamation of May 29, 1943. The area includes Mount Angeles, a beautiful lake of the same name, fine old growth of Douglas fir, and the Webster gardens.

Hawaii National Park addition.—The Territorial Legislature of Hawaii adopted a resolution on February 27, 1943, directing the Commissioner of Public Lands to acquire 10,511 acres by purchase or condemnation for addition to Hawaii National Park, as authorized by act of June 30, 1938, and provided \$15,000 for the acquisition.

Lands acquired.—Although no new land acquisition projects were authorized during the year, 3,188 acres were acquired as a result of projects under way, 868 acres were donated, and 190,903 acres were transferred from other Federal agencies, as shown in the following table:

Lands acquired for the National Park System, July 1, 1942, to June 30, 1943

	Acquired by	Funds expended		Acres	Total Federal lands in area (acres)
		Federal funds	Donated funds		
Antietam National Battlefield Site, Maryland.	Donation.	-----	-----	1.00	51.73
Blue Ridge Parkway, Virginia-North Carolina.	do.	-----	-----	473.96	36,045.17
Capitol Reef National Monument, Utah.	Purchase.	\$1,800.00	66.00	-----	33,068.74
Great Smoky Mountains National Park, Tennessee-North Carolina.	do.	100,943.11	2,744.50	-----	462,355.10
Jackson Hole National Monument, Wyoming.	Transfer	-----	\$100.00	170,308.00	170,308.00
Kennesaw Mountain National Battlefield Park, Georgia.	Purchase.	17,263.10	280.79	-----	3,094.21
Mammoth Cave National Park, Kentucky.	do.	-----	15,675.00	377.45	50,353.83
Olympic National Park, Washington.	Donation.	-----	3.63	20,600.00	845,991.92
Saratoga National Historical Park, New York.	Transfer	-----	-----	11.70	-----
Additional disbursements in 1943 for lands acquired previously.	Donation.	5,400.00	96.35	-----	-----
	Purchase.	9,201.80	-----	-----	1,535.90
Total		134,608.01	15,775.00	194,963.94	1,602,790.60
Lands in Federal ownership in other areas.					19,763,564.84
Less acreage in Petersburg National Military Park transferred to War Department pursuant to the act of June 5, 1942 (56 Stat. 332)					21,366,355.44
					738.75
Non-Federal lands within authorized boundaries					21,365,616.69
					770,677.31
Acreage within maximum boundaries					22,136,294.00

Other Accessions.—Important gifts of historical materials included a valuable collection of letters and the personal effects of Gen. George A. Custer and a collection of drawings, paintings, and photographs by the late William H. Jackson. His death at 99 brought to a close a life which had been devoted to an interpretation of the West. The sketches bequeathed to the National Park Service included some that were made in 1863 while he was soldier in the Union Army in Virginia, and others extending over a period of 79 years during which he recorded events and scenes along the Oregon Trail, early expeditions into the Yellowstone, and many other activities of the pioneer West. Plans are being developed to exhibit these significant historical items in a W. H. Jackson room in the museum at Scotts Bluff National Monument.

The Carnegie Institution of Washington donated to the National Park Service its second extensive gift of publications. They covered reports by the institution in the fields of ethnology, archeology, biology, geology, and history with a monetary value of \$1,500. The material was distributed to a score of field areas, the four regional offices, and the Director's Office.

NATIONAL PARK AND MONUMENT PROJECTS

Big Bend National Park Project, Texas.—Situated in the impressive Big Bend region of the Rio Grande River, from which the park takes its name, this area contains some of the most notable of all southwestern mountain, plains, and canyon scenes. From the Chisos peaks the landscape stretches south into Mexico (where the Mexican Government has an adjoining project). The park combines unusually significant exhibits of historic, prehistoric, physiographic, and biologic types, highly important in the interpretation of cultural America.

Unsurpassed in the park field was the achievement of the State of Texas in acquiring 476,972.10 acres of land for this project in one year's time, following the appropriation in 1941 of \$1,500,000 by the Texas legislature for that purpose. The land bought by the State with this fund, plus other State land in the project, brought the total of State holdings to 697,683.5 acres, only 15,236 acres short of the total of 712,919.5 within the approved park boundary. Plans for the acceptance of this area as a national park will be completed as soon as the deeds have been perfected. The Congress included funds for the administration and protection of the park in the 1944 Interior Appropriation Act.

Cape Hatteras National Seashore Recreational Area Project, North Carolina.—A more interesting example of the beach type of ocean shore than this area cannot be found on the eastern coast. The raw, windblown sands driving upon the land from the sea, the rugged patches of trees and shrubs struggling to maintain existence, the miles of quiet marshland, the rich bird life and aquatic biology, the grand scale of the scene, its human history extending back to pre-Revolutionary times, its recreational attractiveness, and the rapid changes of expression brought on by alternations of calm and storm over this vast Atlantic wilderness, afford an opportunity to conserve a worthwhile and distinctive aspect of America.

Titles and options covering considerable land within this 62,000-acre project, which was authorized by the act of August 17, 1937, were acquired by the Cape Hatteras Seashore Commission. A plan of procedure was formulated between the State and Federal authorities to establish the area when a portion sufficient for practical administration has been acquired in one unit and deeded to the Federal Government. During the year the State enacted legislation which authorizes State funds for the purchase of land within the project.

Cumberland Gap National Historical Park Project, Kentucky, Tennessee, and Virginia.—The Cumberland Gap region is significant

principally in the story of early immigration, transportation and settlement in the midwest heart of America. Though much of its once wild and picturesque forests and streams have been modified by man's inroads, this historic spot still retains much of the atmosphere of adventure which prevailed when hunter, trapper, soldier, colonist, thief, and vagabond alike passed through the gap in the great pageant of our westward expansion.

Negotiations during the year with representatives of the three States concerned resulted in a general agreement in regard to a minimum project area of 6,000 acres to include the most significant historical features. The three States obtained the authority of Congress, by act of May 26, 1943 (amending the act of June 11, 1940), to enter into a compact to acquire the necessary properties and to transfer them to the Federal Government. With \$225,000 available among the three States for the project and with the authority of the Congress for an interstate compact, rapid progress is anticipated.

George Washington Carver National Monument Project, Missouri.—In accordance with an act passed by the Congress, the Moses Carver plantation, near Diamond, Mo., where the famous Negro scientist was born, was investigated by the National Park Service, to determine its significance as a national monument to commemorate the life's accomplishments of George Washington Carver in the advancement of human welfare.

Other projects—Efforts were continued during the year by the Governor of Florida to acquire sufficient land for the Everglades National Park Project.

An area on the American side of the International Boundary in the State of Arizona was selected for the Coronado International Memorial. Further progress awaits the acquisition by the Republic of Mexico of an adjoining area in the State of Sonora.

The Fort Frederica Association acquired most of the land needed for the establishment of Fort Frederica National Monument near Brunswick, Ga.

Richmond National Battlefield Park Project, Richmond, Va.—During the past year progress has been made by the State of Virginia toward the acquisition of approximately 700 acres of land on which are located the earthworks erected to defend the Confederate capital in the Peninsular Campaign of 1862 and in the battle of Cold Harbor in 1864.

PLANNING

Alaska Highway.—On January 8, 1943, the President authorized a survey of the lands adjoining the 310 miles of the Alaska Highway in

Alaska, and approved an allocation of \$50,000 from the highway fund for that purpose. The National Park Service was asked to undertake this study as a basis for protection of landscape and other values on the Government lands bordering the highway.

Public Land Order of July 20, 1942, withdrew from entry a strip of land 40 miles wide, 20 miles on each side of the line of the general route of the highway in Alaska, to provide military protection during the war and to allow time for the conduct of land use studies prior to settlement and development. The Canadian Government reserved a strip of land 2 miles wide along the 1,360 miles of the highway in Canada.

A staff of four National Park Service employees established headquarters in Juneau, Alaska, in June 1943. The study is expected to be completed by October 1944. Consideration will also be given to the lands adjoining the Richardson Highway and the cut-off from Tanana Crossing to Anchorage in Alaska. Other Federal agencies cooperating in the studies include the Fish and Wildlife Service, United States Army, Forest Service, Bureau of Mines, General Land Office, Geological Survey, and the Office of Indian Affairs. As far as the National Park Service is concerned, the aim of this study is to prevent this highway, which runs largely through public domain, from going the way of haphazard and unplanned development.

Drainage basins.—With funds allotted by the Bureau of Reclamation, a plan was completed for effective utilization of recreational opportunities created by the Columbia River Reclamation project at Grand Coulee Dam in the State of Washington. It was developed in cooperation with a committee of Federal, State, and local people.

On the Central Valley project in California, the National Park Service provided the leadership for a recreational study which is being planned with the assistance of a committee representing all State and local interests. A technical survey of the recreational resources of the Colorado River Basin was also begun.

Denison Dam and Reservoir Recreational Planning Project, Texas and Oklahoma.—Field investigations covering the recreational possibilities of the Denison Dam and Reservoir have been virtually completed. These include locations and plans for recreational developments, historic and archeological resources, and fish and wildlife resources, in which latter study the Fish and Wildlife Service cooperated.

Advance planning.—In anticipation of the economic changes from wartime to peace, the National Park Service has been asked to complete its project construction programs, which form a dependable list

of necessary and appropriate physical improvements, and roads and trails projects.

Judging from the experience after World War I, with the removal of transportation restrictions the pent-up urge to travel on the part of millions of people will result in tremendous increase in the number of park visitors. Adequate plans must be made to take care of them. Such considerations as the design and rotation of the use of campgrounds, the location and construction of new facilities, the routing of traffic so that all may benefit from visits to the areas with minimum damage to natural features and landscape beauty, and the reorganization and training of personnel, are essential phases of advance plans that should be considered now. While some work along these lines can be done with the present reduced technical staff, prior to the initiation of any general public works program, the Service must be provided with planning funds to make studies, surveys, and plans of the proposed projects.

RECREATIONAL DEMONSTRATION AREAS

The acceptance by the State of Oklahoma of the 2,228-acre Lake Murray Recreational Demonstration Area on February 20, 1943, marked the beginning of the process of transferring these areas from Federal to other jurisdictions as authorized by the act of June 6, 1942. Since that date, the task of effecting additional transfers has progressed as rapidly as the deeds could be prepared and submitted for approval. Sixteen recreational demonstration areas have been transferred, or approved for transfer to the States, one has been transferred to the Bureau of Reclamation, and nine have been added, in whole or in part, to the National Park System. Thus 26 out of a total of 46 recreational demonstration areas have been disposed of. Seven of the twenty areas remaining are being held for further study to determine whether they, or parts of them, should be given permanent status in the National Park System. They are Camden Hills, Maine; Hickory Run, Pa.; Catoclin, Md.; Fall Creek Falls and Shelby Forest, Tenn.; Custer, S. Dak.; and Roosevelt, N. Dak.

The 13 others in 7 States are still to be disposed of when the State or other public agencies, which are expected ultimately to take them over, are in a position to do so. The status of all 46 of these areas transferred to the States in recent years or added to the National Park System is shown in the tabulation on page 219.

ADVISORY BOARD

Because of war conditions, meetings of the entire Advisory Board on National Parks, Historic Sites, Buildings and Monuments were

not held, but an interim committee of four members met twice during the fiscal year 1943. The counsel of that committee has been helpful in meeting the demands for war production and military uses that would not destroy irreplaceable values in National Park Service areas. The members of the interim committee are Edmund H. Abrahams, chairman; Dr. Waldo G. Leland; Charles G. Sauers; and Richard Lieber. The other members of the Board include Dr. Clark Wissler, vice chairman; Dr. Frank H. Setzler, secretary; Dr. Thomas Barbour; Dr. Herbert E. Bolton; Mrs. Reau Folk; and Dr. Fiske Kimball. George de Benneville Keim, a member of the Board, died on July 9, 1943.

NATIONAL PARK CONCESSIONS, INC.

National Park Concessions, Inc., the nonprofit distributing corporation authorized by the Department of the Interior in 1941, was authorized to purchase and operate the concession facilities at Isle Royale National Park, Michigan, and at Vanderbilt Mansion National Historic Site, New York. The corporation also entered into a subagency agreement with the Lassen Park Co. to operate the concessions in Lassen Volcanic National Park for the duration of the war.

ADMINISTRATIVE ORGANIZATION

Because of the many curtailments caused by the war, efforts were made to strengthen the administrative organization of the National Park Service. Prior to this year, special appropriations for the Civilian Conservation Corps, Works Progress Administration, Public Works Administration, and other emergency agencies were available to perform essential Service functions. As they were discontinued, certain basic functions in the Director's Office, the regional offices, and the field offices were adversely affected. In collaboration with the Bureau of the Budget and the Appropriations Committees of the Congress, funds were provided to continue nucleus staffs of engineers, landscape architects, and historians in the Director's Office and in the four regional offices of the Service, thus putting important basic functions upon a permanent rather than a temporary basis.

Consolidated management of functions and activities is also being accomplished. The headquarters of the Southwestern National Monuments was consolidated with the Region Three Office at Santa Fe, N. Mex., and duties were reassigned so as to make for a reduction in the combined force.

Reducing the Service to a minimum basis has been a detailed and aggressive program. Each function has been analyzed as to its need

in wartime. Activities such as the United States Travel Bureau, the Historic Sites Survey, the Historic American Buildings Survey, and land acquisition, with the exception of completing authorized projects, were discontinued. Construction of major roads, trails, parkways, buildings and utilities was stopped. Equipment not necessary to vital park and monument protection was transferred to war agencies.

The problem of maintenance assumed major proportions during the year. Drastic shortages in the number of workers was caused by the withdrawal and diversion of manpower to the armed forces and war industries. The abolishment of the Civilian Conservation Corps withdrew maintenance services conservatively valued at \$1,000,000 annually. Many areas depended upon the CCC for practically all of their maintenance work. The shortage of personnel, together with the lack of many necessary supplies and replacement items, increased the work of the small maintenance organization that was available.

Unfortunately, storms further increased the work of the maintenance staff. During January 1943, severe storms in the West caused considerable damage in Mount Rainier, Yosemite, Sequoia, and Zion National Parks, and in Oregon Caves and Death Valley National Monuments. Hundreds of trees fell across roads, trails, and telephone and power lines; sewer lines were washed out; bridges and culverts were damaged; and rock and earth slides blocked many roads and trails. Flash floods and ice storms in the East damaged thousands of ornamental and historic trees, roads and bridges in the battlefields, monuments, and cemeteries in Virginia. Without remedial action, requiring the immediate attention of experienced engineers, landscape architects, foresters, and historians, the usefulness of these areas to the Nation would have been greatly depreciated.

The transfer of the Director's Office from Washington, D. C., to Chicago, Ill., caused a disruption of work for 2 months during August and September 1942. As the year progressed, the difficulties of operating the central office at a base far removed from the Department, the Congress, the Bureau of the Budget, and the loss of cooperative advice and counsel from other Federal agencies and conservation organizations located at the seat of Government were increasingly evident. Experience of the past year has amply demonstrated that for efficient and economical operation, the Director's office (as distinguished from the regional and field offices), should be returned to Washington, D. C., as soon as possible after the close of the war.

PERSONNEL

The reduction in permanent full-time positions from 4,510 on June 30, 1942, to 1,974 on June 30, 1943, including 121 "working fund"

positions, was made with few of the personal inconveniences that would ordinarily result from such a reduction. During the fiscal year, 334 employees of the Service joined the armed forces, bringing the total to over 600. Also, approximately 500 employees transferred to war agencies. No seasonal ranger-naturalists were employed during the 1943 travel season, and seasonal ranger positions not necessary to protection of the parks and monuments were not filled. Women park rangers and fire lookouts were employed for the summer season in several areas.

The Service is proud of its personnel. Those who entered the armed forces are serving at battlefronts throughout the world. Those who remained on duty did a creditable job of defending Service principles and protecting national park properties. The fact that with reduced funds all of the special war uses recounted in this report were handled efficiently and effectively, while at the same time those fortunate to be able to visit the parks, including increasing numbers of our military forces, were taken care of, is ample evidence of the loyalty of our workers to the institution that they serve.

Under conditions of total war the concept of conservation represented by the national parks has faced the most critical challenge in its history. Statement and restatement of purposes and responsibilities of the Service's trusteeship had to be made. Some sacrifices in the common cause were necessary, and more may be inevitable. But it is believed that we can emerge with the basic idea intact that the national parks and monuments must be protected as symbols of the greatness of this Nation.

Travel figures available for less than 5 years.

Travel figures not available or maintained.

Closed to visitors.

Established by Presidential Proclamation, Mar. 15, 1943.

Federally owned; operated by cooperating private agency.

Federally owned and operated.

Nonfederally owned and operated.

Federally and privately owned and operated.

Included in travel figures for adjacent battlefield site, military park, or historical park.

Travel included under memorials.

Includes Choptank Area, Virginia, and C. & O. Canal, Md.

Administered by Service pending final establishment.

Includes 1,655,720 military visitors.

Fish and Wildlife Service¹

IRA N. GABRIELSON, Director

THE Fish and Wildlife Service is the custodian of a rich natural resource which contributes to the specialized wartime demands of the Nation as well as to the continuing needs of national existence in many and often surprising ways. This resource consists of two major segments: The fish supplies of a vast coastal area and of the lakes and rivers of the interior of the country; and the wildlife resources comprising a wide variety of birds and fur-bearing animals. The direct contribution of this living resource to the Nation's requirements of food and strategic materials is imposing. The fisheries yield four billion pounds of aquatic products, from which high-protein foods, vitamin oils, animal feeds, and oils that are essential in certain industries are produced. The food which is derived from wildlife includes approximately 9 million pounds from domestic rabbits, another million and a half from small wild game, and 250 million pounds from larger game. Our herds of deer and elk have already yielded a large quantity of hides to be processed into leather for the Army, and other animals and birds have provided a quantity of furs and feathers which have been used in the manufacture of garments and specialized equipment which is indispensable to the armed forces in cold climates.

The Service's resources of men, material, and land have also been enlisted in the war program. Utilizing their technical skills and specialized knowledge, representatives of the Service have already given assistance to the Nation at war. We have instructed the military services in methods of controlling destructive and disease-carrying rodents in Army encampments, provided information of strategic importance about certain remote outposts which are little known except

¹In August 1942 the headquarters of the Fish and Wildlife Service was transferred to Chicago. A liaison office with a small staff remained in Washington to facilitate the maintenance of relationships between the Service and other governmental agencies in Washington.

for the explorations of our naturalists, and controlled species and injurious to crops. We have made available the facilities of our refuges for military training, assisted Army and Navy Intelligence units and military patrols in remote areas in which our field personnel is stationed, and contributed to the material needs of the Navy by carefully harvesting the grain and fiber crops, hay, and timber in the national wildlife refuges.

In addition to these contributions to the war program on the military fronts and at home, the Service has also fulfilled its obligation to continue the basic studies and the protective vigilance and measures necessary to insure the preservation of our fisheries and our wildlife resources for future use.

AIDING THE WAR PROGRAM WITH LAND, VESSELS, AND PERSONNEL

The Aleutian Islands, a national wildlife refuge comprising over 3,000,000 acres, is in the immediate zone of hostilities. Intimate knowledge on the part of Service personnel of the topography and meteorology of this chain of islands, sought by the armed forces, was furnished at their disposal. To the northward lie the Pribilof Islands, summer home of the highly valuable fur seal herd. In view of the possibility of an attack on these islands, which are administered by this Service, their populations of native workers (476) and our personnel (23) of teachers, doctors, and administrators were evacuated to the mainland where essential care of the natives is being continued. Through the branch of National Parks Wildlife, information and photographs of strategic value in relation to Alaskan and Siberian territories were given to Army and Navy authorities.

In its capacity as a land administering agency, the Service was able to cooperate with the military authorities in providing training areas. Sites aggregating 1,845,000 acres were allotted on 35 national wildlife refuges within the United States for many types of Army and Navy training. Despite the vast extent of these activities, disturbance and harm to wildlife have been held to a minimum through careful selection of the areas and through the excellent cooperation of the Army services.

Direct aid was provided also by the transfer of 11 of the largest vessels in the Service's fleet to the Navy, Coast Guard, and Marine Corps.

Our staff of game management agents contributed materially to the internal security of the Nation by furnishing evidence of subversive activities to the Army and Navy Intelligence units, and to the Federal Bureau of Investigation. In Alaska, wildlife agents cooperated

the military forces in patrolling the Territory. More than half of the qualified personnel has been employed in cooperation with war agencies and the Department of Justice in the appraisal and acquisition of lands for war purposes.

At the request of Army and Navy officials, field men of the Service have direct assistance in controlling rodents on numerous military reservations throughout the country. Aid was rendered in curtailing serious damage by rats to subsistence and clothing supplies. Another important phase of the work was the control of plague-carrying field rodents that constituted a menace to the health of troops. It was also necessary to control pocket gophers and kangaroo rats that were undermining airplane runways and building dirt mounds on military airfields, thus presenting a serious hazard to aircraft in taking-off and landing. A Service employee is serving on the faculty of the Army Medical School, delivering lectures on rodent control before classes of the School of Tropical and Military Medicine in order to prepare the candidates to supervise campaigns for the suppression of rodent-borne diseases in tropical countries. Assistance was given to the Navy Department in the development of natural camouflage materials for aquatic situations. Help was also extended that Department in its search for materials that might make fresh water available from sea water. In this connection a great many plant materials were subjected to chemical, biological, and physical tests and a few of them showed promise for practical use. In addition, cooperation was given in the testing of materials for "survival kits." Suggestions were given on subject matter for a Navy manual on "Survival" to be used in training aviators to take care of themselves should they be forced to land in areas remote from civilization.

AIDING THE WAR PROGRAM WITH WILDLIFE AND OTHER CROPS

Through notable increase in the economic use of the Federal wildlife refuges, a variety of contributions were made to national needs. Thus grazing to the extent of 227,585 animal months was authorized and 13,945 tons of hay were harvested during the year. The timber cut included: 10,900 cords of fuel and pulp wood, 488,600 board feet of lumber, and 23,975 posts, poles, and ties. In addition, 18,680 acres of refuge land, cultivated by private individuals and refuge personnel, produced 65,600 pounds of seed crops, 70,000 pounds of fiber crops, and 430,000 bushels of grain and other crops, most of which were used in augmenting the Nation's food supply. Increased fur production made it possible to provide additional material which

for the explorations of our naturalists, and controlled species which are injurious to crops. We have made available the facilities of wildlife refuges for military training, assisted Army and Navy Intelligence units and military patrols in remote areas in which our field personnel is stationed, and contributed to the material needs of the Nation by carefully harvesting the grain and fiber crops, hay, and timber from the national wildlife refuges.

In addition to these contributions to the war program on the military fronts and at home, the Service has also fulfilled its obligations to continue the basic studies and the protective vigilance and care necessary to insure the preservation of our fisheries and our wildlife resources for future use.

AIDING THE WAR PROGRAM WITH LAND, VESSELS, MEN

The Aleutian Islands, a national wildlife refuge comprising nearly 3,000,000 acres, is in the immediate zone of hostilities. Intimate knowledge on the part of Service personnel of the topography and meteorology of this chain of islands, sought by the armed forces, was freely placed at their disposal. To the northward lie the Pribilof Islands, summer home of the highly valuable fur seal herd. In view of the possibility of an attack on these islands, which are administered by this Service, their populations of native workers (476) and our personnel (23) of teachers, doctors, and administrators were evacuated to the mainland where essential care of the natives is being continued. Through the branch of National Parks Wildlife, information and photographs of strategic value in relation to Alaskan and Siberian territories were given to Army and Navy authorities.

In its capacity as a land administering agency, the Service was able to cooperate with the military authorities in providing training areas. Sites aggregating 1,845,000 acres were allotted on 35 national wildlife refuges within the United States for many types of Army and Navy training. Despite the vast extent of these activities, disturbance and harm to wildlife have been held to a minimum through careful selection of the areas and through the excellent cooperation of the armed services.

Direct aid was provided also by the transfer of 11 of the larger vessels in the Service's fleet to the Navy, Coast Guard, and Marine Corps.

Our staff of game management agents contributed materially to the internal security of the Nation by furnishing evidence of subversive activities to the Army and Navy Intelligence units, and to the Federal Bureau of Investigation. In Alaska, wildlife agents cooperated with

the military forces in patrolling the Territory. More than half of the qualified personnel has been employed in cooperation with war agencies and the Department of Justice in the appraisal and acquisition of lands for war purposes.

At the request of Army and Navy officials, field men of the Service gave direct assistance in controlling rodents on numerous military reservations throughout the country. Aid was rendered in curtailing serious damage by rats to subsistence and clothing supplies. Another important phase of the work was the control of plague-carrying field rodents that constituted a menace to the health of troops. It was also necessary to control pocket gophers and kangaroo rats that were undermining airplane runways and building dirt mounds on military airfields, thus presenting a serious hazard to aircraft in taking-off and landing. A Service employee is serving on the faculty of the Army Medical School, delivering lectures on rodent control before classes of the School of Tropical and Military Medicine in order to prepare the candidates to supervise campaigns for the suppression of rodent-borne diseases in tropical countries. Assistance was given to the Navy Department in the development of natural camouflage materials for aquatic situations. Help was also extended that Department in its search for materials that might make fresh water available from sea water. In this connection a great many plant materials were subjected to chemical, biological, and physical tests and a few of them showed promise for practical use. In addition, cooperation was given in the testing of materials for "survival kits." Suggestions were given on subject matter for a Navy manual on "Survival" to be used in training aviators to take care of themselves should they be forced to land in areas remote from civilization.

AIDING THE WAR PROGRAM WITH WILDLIFE AND OTHER CROPS

Through notable increase in the economic use of the Federal wildlife refuges, a variety of contributions were made to national needs. Thus grazing to the extent of 227,585 animal months was authorized and 13,945 tons of hay were harvested during the year. The timber cut included: 10,900 cords of fuel and pulp wood, 488,600 board feet of lumber, and 23,975 posts, poles, and ties. In addition, 18,680 acres of refuge land, cultivated by private individuals and refuge personnel, produced 65,600 pounds of seed crops, 70,000 pounds of fiber crops, and 430,000 bushels of grain and other crops, most of which were used in augmenting the Nation's food supply. Increased fur production made it possible to provide additional material which

was vitally important in the manufacture of special clothing for the use of the armed forces in frigid climates.

The results of the biological developments of refuge lands undertaken during the height of CCC and WPA activities are reflected in increases in wildlife. Between 1937 and 1942, big game on national wildlife refuges increased 80 percent. Waterfowl populations increased from 27 millions in 1934 to between 115 and 120 millions in the spring of 1943, and 25 million waterfowl used the refuges for resting and feeding along the major flyways during the 1942 fall migration. Increases approximating those of the waterfowl are also evident in the upland game, which in the case of pheasants have resulted in the extraordinary density of 4 birds per acre on the Sand Lake Refuge in South Dakota.

The total revenue from the economic uses on national wildlife refuges, including the disposition of big game animals, fur animals, and surplus products, was \$213,800.

Sealing on the Pribilof Islands in the 1942 season was interrupted suddenly, after only 127 skins had been taken, when evacuation of the islands was ordered by military authorities. Before the opening of the 1943 season, however, sufficient personnel was returned to resume sealing and a large take of skins is anticipated. Supplied by the take of the previous season, two public auction sales of fur-seal skins were held at St. Louis, Mo., one in October and one in March. In all, 42,447 sealskins were sold for the account of the Government for a total of \$1,537,530.87.

The handling of blue foxes on the Pribilof Islands is incidental to sealing activities. In the 1942-43 season, 785 fox skins were taken, of which 182 were from St. Paul, and 603 were from St. George Islands.

During the year there were sold at public auction 780 blue, and 5 white, fox skins taken on the islands. The blue pelts sold for \$10,068 and the white for \$85, a total of \$10,153.

Wartime utilization of fish, game, and fur, consistent with preservation of breeding stock, is being emphasized on Indian lands through investigation of these resources, extension work among the Indians, and action by the Tribal Councils. Fisheries, long the most important wildlife activity among Indians, are being expanded. Investigations of Pacific Northwest salmon fisheries, of which the Indians' share approximates 1 million dollars annually, have resulted in closer cooperation between the Indians and the State of Washington, particularly at Celilo Falls; increased numbers of spawning fish in the Yakima River spring run of chinooks; planting of fry to establish new runs of silver salmon in three coastal streams; an increased efficiency in

marketing the Quinault sockeye catch. At Red Lake, Minn., the commercial catch, chiefly walleyed pike, was increased from 650,000 pounds to 1,000,000 pounds, on the basis of studies by Service biologists. The supply of fish for local consumption among the Indians was increased by plantings, by improved management recommended after scientific study, and by expansion of fish production in stock-watering reservoirs.

Few reservations have had a surplus of game to draw upon as a wartime source of meat, because of the prevalence of unrestricted hunting by Indians. At Crow and Pine Ridge, surplus buffalos have been used, and unusually large numbers of rabbits have been killed on several areas. In Alaska, where scientific studies of lichen range showed the desirability of reducing the Nunivak Island reindeer herd, authority was given for reduction from 19,000 to 10,000 head. Both meat and hides are to be used by military and civilian populations entirely within the Territory.

Improved management and marketing of furs is now being carried out in several northern reservations as the result of recommendations following scientific investigations. Beaver management plans have been started at Grand Portage, Rosebud, Pine Ridge, and Flathead. At the last reservation a system of marketing through public auction has increased returns to the trappers by about 30 percent and has facilitated law enforcement. A somewhat similar muskrat management project, based upon intensive investigations by Service biologists, has been authorized at Bad River, Wis., on 10,105 acres.

STIMULATION OF FOOD PRODUCTION

Valuable as were the direct contributions of the Service to the national food and fur supplies, they were far exceeded by the results of stimulating and aiding production through regular channels and of encouraging the use of partially or wholly neglected resources.

FISHERY PRODUCTS

Because of war-created needs, the products of the Nation's fisheries are finding a greater variety of uses and are more urgently needed than ever before. As excellent muscle-builders, rich in vitamins and minerals, fish are especially valuable foods for fighting men and civilians. Canned fish are a concentrated food easily transported to soldiers in remote bases or on battlefields. Vitamin oils obtained from fish livers are helping to sharpen the eyesight of night bombing crews or of troops on night maneuvers, and are aiding troops and civilians to build up resistance to respiratory infections. Animal-feeding meals and oils,

derived chiefly from Pacific pilchards, herring, and menhaden, are providing the proteins and vitamins needed to produce hogs and poultry in larger numbers and of better quality. In the industrial field, fish oils have a variety of important uses. They are used, for example, in the preparation of glycerine for explosives and as core oils for aluminum castings and lubricants for delicate machinery.

During the first year of the war the yield of the United States fisheries fell more than a billion pounds below the 5-billion pound catch of 1941. This decline, which unfortunately occurred in a year when demands for the products of the fisheries were at an unprecedented high, was caused by the requisitioning of fishing boats by the military services, manpower difficulties, and other war-created hindrances to normal operation. Early in 1943 it was announced that if all governmental and civilian requirements for fish were to be met, a catch of 6 billion pounds would be needed in 1943.

To assist the fisheries to operate effectively in the midst of war, the President established the Office of the Coordinator of Fisheries by Executive order in July 1943. The Office was staffed by members of the Fish and Wildlife Service, its officials and field representatives being drawn largely from the Divisions of Fishery Industries and Fishery Biology. While direct services to the fishing industry are now performed largely by the Coordinator's Office, and are summarized in a separate section of this annual report, the basic research activities have remained in the Fish and Wildlife Service.

Improvement of fishery technology.—Technological studies have been concerned chiefly with the production, preservation, and utilization of fishery products and byproducts. Laboratories were maintained at College Park, Md.; Seattle, Wash.; Ketchikan, Alaska; and at Mayaguez, Puerto Rico.

Because the amount of tin available for manufacturers of fishery products has been greatly curtailed, extensive research has been conducted on nonmetallic containers for fresh shucked oysters, clams, and mussels; for fresh cooked crab meat and shrimps and for fresh fillets. The aim of this research is to aid industry and government to determine to what extent it is possible to use substitute materials, and to develop practicable substitutes for tin.

Packs of all types of canned fishery products have been made in containers fabricated from substitute plates containing no tin, or smaller amounts of tin than the plate formerly used. These are being subjected to storage, shipping, and other tests to determine their suitability. To effect further possible savings in tin for preserved fishery products, experiments are being continued to develop satisfactory dehydrated and salted fish products.

Field and laboratory tests have been made to determine the utility of fibers other than manila in the fabrication of cordage and certain types of trawl nets. The results show, for example, where sisal, jute, hemp, istle, and other hard and soft fibers can be used in the fishing industry.

Studies in Service laboratories and in cooperation with industrial and other agencies have led to the development of new canned fishery products for government and civilian use. Principal among these are canned Maine sea herring, menhaden, mussels, and a fish loaf, all of which are now being packed commercially. Cooperative work with the Army has developed several promising special canned rations incorporating fish.

To further the use of species of fishes which formerly were discarded, or utilized in small quantities, studies are being made to determine suitable methods of handling and preservation. Other investigations deal with their nutritive value and with the development of recipes for cooking these new species. Some of the groups investigated have been soupfin shark, Alaska sharks, carp, burbot, monkfish, skates, and mussels. "Wartime Fish Cookery" and "Home Canning of Fishery Products," two publications designed to guide the consumer to fuller and more satisfactory use of fish, were released.

Work on vitamin oils provided a basis for more judicious utilization of raw material sources and has supplied information on the stability of these oils and on handling and processing factors that influence it.

The war made it essential to find new sources of supply of agar, a seaweed product which is extensively used as a medium in bacteriological research and in numerous food industries and in manufacturing processes. Formerly 90 percent of the agar used in the United States was imported from Japan. Our technologists are now investigating the properties of numerous seaweed gums in an attempt to find a satisfactory substitute for agar.

Experiments in adapting a purse seine to South Atlantic shrimp trawlers promise a materially increased catch of other food species by these vessels during the season when no shrimp are caught.

Improvement of fishery economics.—Investigations have been directly concerned with holding production at a high level and with solving problems of distribution. The use of menhaden from the southern fisheries as bait in a northern cod fishery where other bait was not available demonstrated the translation of research into fish production. Processing Great Lakes herring into fillets for Army use, and establishing industrial production for such neglected species as gars, sharks, and king whiting are representative of research activities leading to immediate action. The king whiting, a potentially

valuable variety produced incidentally to the capture of another species, heretofore had been discarded but now has found a satisfactory market. Other species, such as mullet, are readily marketed in certain parts of their range but are neglected in other areas of abundance.

Dissemination of fishery statistics.—The statistical section continued the collection and dissemination of data relating to the commercial catch of fishery products, employment of personnel, craft, and gear in the industry, and the production of manufactured fishery commodities. It was necessary, however, to curtail certain of the regular statistical surveys and to expand others in order to undertake the collection of specific data required by the various war planning and regulatory agencies.

The collection and publication of monthly data on the important vitamin-A industry was begun during the year, and the quarterly survey to obtain information on the domestic production and stocks of all marine animal oils was changed to a monthly basis. Special surveys were conducted to obtain information for the War Shipping Administration on the earnings of certain Atlantic and Pacific coast fishing craft, and data were collected for the Office of Price Administration on the price ceilings of individual wholesale dealers for manufactured fishery products.

When shortages of critical materials developed as a result of the war, it became necessary to prepare estimates on the annual requirements of the industry for supplies and equipment. Fortunately, a Nation-wide survey to obtain data on the material needs of the industry had been begun during the previous fiscal year and was completed in the fall of 1942. The data obtained in this survey and the information collected in a special canvass relative to the industry's requirements of controlled materials (steel, copper, and aluminum) served as a basis for estimates that were used in obtaining allocations of supplies which were required by the fishing industry.

In order to assist the Federal agencies concerned with the Nation's food program in planning for the purchase and allocation of fishery products, historical information relative to the industry, current production data, field reports on the trends of the fisheries, and estimates of future production were prepared throughout the year for their use.

Fishery market news service.—To meet the requests of war agencies and a war-gearred fishing industry, the daily reports, monthly and annual summaries, and the monthly review have all been expanded to cover more areas and supply additional current information on all phases of production, distribution, and marketing.

All daily reports have generally increased the volume of their price quotations. The New York report now includes Norfolk production data, while the Boston report has better coverage of Maine, and the Seattle report has better coverage of Oregon and California. Federal Regulations, and limitation of allocation orders, are now either reprinted or briefed in the daily reports to inform the fishing industry of the meaning of these rules and regulations as soon as possible. The industry has indicated that it appreciates this added service.

The weekly summaries have been expanded, particularly in the Boston report, in order to make weighted average prices immediately available. Wholesale fish prices of this type are supplied the Bureau of Labor Statistics weekly for inclusion in its index which covers 900 price series.

Monthly and annual summaries have increased their coverage in both text and tabular material. Each annual now includes a monthly index of production and tables defining market classifications for fish and shellfish. The Chicago and New Orleans monthly summaries have added a series of weekly price ranges.

"Fishery Market News," the monthly review issued in Washington, has added a number of pages for timely articles on matters affecting the fisheries, particularly Federal regulations. Complete or abbreviated versions of the latter are included as issued to provide a convenient form of reference. A better picture of the fisheries from month to month also has been developed by including additional sectional production and price data both in text and graphic form.

Consumer relations.—Consumers, deprived of the usual abundance and variety of customary foods, needed guidance in maintaining an adequate diet from the foods that were available. In response to this need, the task of informing the public how to derive the maximum food values from the Nation's aquatic resources was undertaken by the Service. Information based on technological investigations in Service laboratories was distributed to consumers through every available educational medium.

Fishery exploratory investigations.—The war has greatly stimulated the establishment of fishery industries in the American Republics and other areas of the Western Hemisphere. While the Caribbean area normally consumes 315,000,000 pounds of fish yearly, it produces only about 160,000,000 pounds. Imports, chiefly salt fish, make up the difference but have been drastically curtailed by reduced transportation facilities.

To determine whether this shortage could be made up by expansion of local fisheries, the Office of the Coordinator of Inter-American Affairs provided funds to the Service for a factual survey. Nearly all

Republics, Colonies, and Possessions in the Caribbean Area were visited by this mission between April and November 1942. Reports and recommendations for each political unit and for the area as a whole have been completed, and have formed the basis of action toward developing or expanding fisheries in this area.

Venezuela, Panama Bay, and Cuba offer the greatest opportunities for expansion of production, but nearly all other parts of the area also can produce more fish. As one result of the work of the Mission, the British colonial governments have procured fishing equipment to maintain normal production and will undertake an intensive cooperative survey of fishing and processing methods. Fish salting projects have been initiated in Cuba and Haiti; and Venezuela has requested assistance in the development of its salt fish industry.

The Service cooperated with the Board of Economic Warfare in surveying fishing possibilities in the Southwest Pacific as part of a general investigation to promote local production of foodstuffs for consumption by our armed forces in that area as well as by civilian populations. It was found that small-scale fisheries could be established at many points. The board has furnished fishing gear and trained personnel to exploit these fisheries.

The Service also cooperated with the Anglo-American Caribbean Commission in the expansion of fisheries in the Bahama Islands. As a result of Service recommendations, tuna were commercially caught and canned in this area. Service representatives advised the local industry regarding methods of preserving fishery products and means for obtaining greater utilization of the fishery resources.

RABBIT AND FURRED-GAME MEAT

World War II has brought about a shortage of many customary foods, and radical changes in eating habits have resulted. Foods that many of us never before considered eating are now being favored. The domestic rabbit is one of the new sources that is helping to solve the meat problem in many homes.

The Federal Government has been recommending domestic rabbit raising for 20 years and during the last 2 years has been cooperating in the food-for-freedom program to put rabbit meat on the dining table. In 1923 about 2,000,000 pounds of domestic rabbit meat were produced annually for food alone; in 1942, the amount was 9,000,000 pounds. Future production is expected to be as much as 12,000,000 pounds. As a result of the Service's campaign to stimulate the production of rabbit meat, new backyard rabbitries are appearing in every community. City and suburban dwellers are learning that for the time, labor, and expense involved, rabbits pay a handsome dividend

in good food. Key men have been selected in each State to cooperate with State colleges and universities, State and county food production units, and with the American Rabbit and Cavy Breeders Association and its affiliated clubs to increase the production and use of domestic rabbit meat.

Since September 1942, the Service has published and distributed 95,000 copies of Conservation Bulletin 25, "Rabbit Raising," to inquirers in every State in the Union and 20 foreign countries. The Extension Service personnel of about 10 percent of all the counties in the United States has requested quantities of these bulletins. The demand for information about rabbits has been so great that 15 States have reproduced for local distribution discussions of the subject which this Service has published.

Encouragement is being given also to a greater utilization of muskrat, raccoon, and opossum meat for human consumption. The estimated production of muskrat meat in 1942 was 1,000,000 pounds, raccoon 400,000 pounds, and opossum 200,000 pounds. It is possible to encourage greater use of these meats by promotional and educational work through the field force of this Service.

PROPAGATION OF FOOD AND GAME FISHES

A shift of emphasis in the propagation of food and game fishes has taken place and is continuing. Loss of manpower, shortages and increased costs of fish food, higher wages, and not least of all the need for increased food production, have influenced this trend.

Altogether 14 fish-cultural stations have been closed and 2 more will curtail operations or close July 1, 1943. These include stations whose production was relatively low and those producing trout for stocking recreational areas. Further reduction has been made by the suspension of cooperative nurseries which propagated trout for stocking Federal forest areas until the fishing load warrants additional plantings. The general policy is to reduce the stocking of game fish in less accessible bodies of water and to concentrate personnel and funds on the production of food fishes.

During 1942 the farm-pond program, advocated and assisted by the Service, has gained impetus. Ponds are fertilized, stocked with balanced populations of fish, and then managed according to recognized practices. They may come into production on a sustained basis within one year and require no restocking. Thus effort in succeeding years may be applied to bringing new areas into production.

There was an increase of 356 percent in fingerlings allotted to ponds constructed under the supervision of the Soil Conservation Service, and of 351 percent to other farm ponds. These will yield

an estimated increase during 1943 of 205 and 235 percent, respectively, in the weight of fish produced. The total production this year of farm ponds stocked in the last 2-year period is estimated at 1,415,805 pounds of fish.

Cooperative distribution programs have been set up between various State and Federal hatcheries for stocking farm ponds and other waters. This has been accomplished by the new regional superintendents of fish distribution. Both Federal and State commitments are filled from the hatchery nearest to the applicant. By preventing a duplication of stocking and distribution, there is better utilization of fingerling fish, a saving of tires and gasoline, and more efficient use of State and Federal fish-cultural facilities, including the time of the personnel.

Salmon salvage operations were increased on the Columbia and begun on the Sacramento Rivers. With the closure of the barrier created by the Shasta Dam, salmon runs were completely cut off in the Sacramento during the fall of 1942. This jeopardizes a commercial catch of between 750,000 and 1,500,000 pounds of salmon. The first spawning and salvage operations will begin during the 1943 spawning run.

In total production there was an increase from 5.86 billion fishes and eggs in 1941 to 7.82 billions in 1942. Among the game fishes these was a reduction in the take of trout eggs and a decrease in trout production. The largest increase in the egg take resulted from the salvage of cod, haddock, and pollock. Commercial species showing an increase included buffalo, whitefish, lake herring, cod, flounder, pollock, and lobster. Black bass, which are used to stock farm fish ponds, were produced in greater number.

Hatchery activities have been intensified for the production of warm-water fishes for farm ponds and the salvage and propagation of salmon to replace spawning runs on the Pacific coast. This will result in larger production of these species. Stocking of trout is concentrated in the areas still most heavily fished and has been temporarily abandoned in less accessible areas.

FEDERAL AID IN WILDLIFE RESTORATION

During the year Federal aid in wildlife restoration was reduced in scope due to conditions imposed by the war. Notwithstanding lessening of activities, however, the program functioned very effectively.

Investigations to determine wildlife populations and their trends as well as the carrying capacities of the ranges were emphasized by the cooperating states. The information sought is essential to sound management of this natural resource. Maintenance of full popula-

tions of wildlife is important as the basis for hunting which provides outdoor recreation for millions of citizens. Without management guided by adequate research, hunting pressure cannot be varied to control depredations, to check range deterioration where overpopulations exist, and to protect wildlife where it should be increased. The bagging of game, which yielded a quarter of a billion pounds of wild meat by the hunters of the Nation during the past hunting season, proves the value of wildlife in providing a supplementary source of food.

Immediately following World War I, there was an upsurge in the sale of hunting licenses, the number sold greatly exceeding the totals for pre-war years. In anticipation of a like situation developing after the present struggle, it is very important that the States maintain wildlife populations on a high plane of productiveness. By the investigative measures conducted through the medium of the Federal-aid program, and the translation of findings into appropriate regulation of hunting seasons and bag limits, wildlife populations can be maintained in a State that will permit use and enjoyment by millions of hunters.

While stress was placed on wildlife management investigations during the year, the States also continued land acquisition and development. Due to material and equipment shortages caused by the war, major construction work could not be undertaken. The States, however, have been able to continue with developmental measures such as cooperating with farmers in soil conservation districts in the planting of perennial legumes in field borders and waste places as an aid to soil conservation and to provide wildlife food and cover. They have also been able to continue the trapping and transplanting of game birds and mammals and furbearers from places where surpluses exist to suitable but vacant areas. Land acquisition efforts have been directed toward the purchase of areas of no particular value for agricultural uses which may advantageously be developed for wildlife during the post-war readjustment period.

The sum of \$1,250,000 was appropriated to carry out the purposes of the Federal Aid in Wildlife Restoration Act this year, as compared with \$2,750,000 for the fiscal year 1942. As of December 31, 1942, the special Federal aid to wildlife restoration fund in the Treasury contained \$9,329,849. Preliminary information on collections of the Federal excise tax on sporting arms and ammunition indicates that the yield for this fiscal year will be approximately \$1,100,000. This will be a great reduction below the \$5,072,588 collected and covered into the special fund during the fiscal year 1942, but it should be remembered that production of the articles upon which the tax is paid was sus-

pended until quite recently, when authorization was granted and scarce materials were made available to meet ammunition requirements for the 1943 hunting season.

Through appropriate legislation, Georgia became eligible for benefits under the cooperative wildlife restoration program during the year, leaving Nevada as the only State not participating. Outside of the United States, restoration projects are in progress in Alaska, Puerto Rico, and the Virgin Islands, extension to them of the benefits of the Federal Aid in Wildlife Restoration Act having been authorized within the fiscal year 1942 by an amendment to the basic law.

WARTIME UTILIZATION OF FURS AND HIDES

FURS AND FUR FIBERS

Because of their warmth-retaining qualities, animal fibers are indispensable to the armed forces and civilians in cold climates. In the present crisis it is necessary to make full use of animal fibers and to allocate each type to the purpose for which it is best adapted. Our objective has been to determine the value of fur as a substitute for other fibers and to develop effective uses for fur byproducts that have hitherto been wasted. Cooperative research with the Bureaus of Animal Industry and Human Nutrition and Home Economics has contributed valuable information to the Office of Quartermaster General. Four confidential reports of the results of this work were prepared and forwarded to that office. Commercial furs were compared with piled fabrics and other materials to determine resistance to abrasion, tearing strength, air permeability, compressibility, compressional resilience, and other qualities. Microscopic analysis of the fibers is necessary to determine the characteristics which contribute to these physical qualities.

Research in the utilization of industrial waste hairs has demonstrated their suitability for making soft brushes and for felts of various kinds. Long-haired furs were studied for their ability to shed ice crystal accumulations, caribou hair for its buoyancy, and Angora rabbit fibers for warmth-retaining qualities. "The report on air permeability of furs and fabrics," says the Quartermaster General, "is proving particularly valuable at this time, inasmuch as it gives us a base on which to isolate the comparative factors of thermal insulation and air permeability in determining the over-all warmth of furs, various types of fabrics, pile fabrics, and windproofs. It is expected that the reports which you have rendered will make a substantial contribution to the development of sound equipment for cold weather."

BIG-GAME HIDES

Because of increased leather requirements and the drastic curtailment of importations, it is of immediate importance that full use be made of the domestic supply of deer and elk hides. A general preference order, reserving deer skin leather for military uses, was issued by the War Production Board.

During the 1942-43 big game season, 615,000 deer and 34,000 elks were taken by licensed hunters in the United States, and approximately 162,000 hides from this source were channeled into industry. Although this number represents only about a fourth of the animals taken during the 1942-43 season, the cooperators feel that assembling that many was very creditable, considering that the demand for this raw material was not known until the first of November. This was a cooperative undertaking to obtain additional leather for the Army. The Quartermaster Corps, the War Production Board, the Federal Departments of Agriculture and Interior, State game and conservation departments, sportsmen's organizations, individual hunters, hide dealers, and leather manufacturers are working together to salvage all the available deer and elk hides—a program that will be continued during the 1943-44 hunting season.

CONSERVATION OF FOOD AND WILDLIFE RESOURCES

The variety of ways in which the Fish and Wildlife Service aids directly or indirectly in production of the Nation's food and wildlife is evident. But production is not enough; what we grow we must protect so that it will be available for use or to assure future supplies. To that end the Service devotes its basic scientific investigations of fisheries and wildlife, and its activities in predator and rodent control, law enforcement, and maintenance and development of wildlife refuges.

CONTROL OF PREDATORY ANIMALS AND INJURIOUS RODENTS

Cooperative predator and rodent control contributed substantially to the war food program of the Nation. The taking of 115,287 predatory animals resulted in the saving of thousands of sheep, calves, and poultry; the treatment of 14,537,033 acres of rodent-infested lands prevented the loss of tons of agricultural crops and range forage; and the control of the common house rat saved large quantities of stored food and feed.

Of the 115,287 predatory animals taken in cooperative projects, 103,981 were coyotes, 1,014 wolves, 9,527 bobcats and lynx, 147 mountain lions, and 618 stock-killing bears. In cooperative field rodent

control work, 2,514,500 acres of infested lands were treated under direct supervision of the Service's field personnel and cooperators and 12,022,533 acres were treated under general instructions.

Total expenditures for both predator and rodent control consisted of \$770,209 from departmental funds, \$540,275 from cooperating states, \$1,344,394 from cooperating counties, livestock and agricultural associations and others, and \$21,400 from emergency funds.

Eight hundred and thirteen thousand, three hundred and sixty-one pounds of rodent bait materials were distributed to cooperators from the Service's Supply Depot at Pocatello, Idaho, in addition to manufactured supplies and equipment used by the Service and cooperators in predatory animal control.

Control operations played an important role in protecting livestock, thus increasing the production of food, wool, and mohair. The control of burrowing field rodents saved vital irrigation structures from damage. The destruction of warehoused fabrics and other strategic materials and the loss and contamination of a variety of stored foods was greatly reduced as a result of a Nation-wide effort to control rats. The Service intensified its rat control activities in the Southeastern and Gulf States in cooperation with local health departments to assist in curtailing a rising incidence of murine typhus, and the work was attended by noteworthy success.

Control of rodents and predators to air maximum production of farm crops and livestock was authorized on only seven Indian reservations this year, and even there the work was hampered by limited funds. The need for control was in each case substantiated by scientific investigation. Need for coyote control also has been found at San Carlos and Fort Apache, but a more complete study has been requested. This is now under way.

Several factors have operated to increase the seriousness of the predator and rodent control problem. There has been a marked decrease in the activity of private trappers, who normally hunt and trap predatory animals for their pelt values. These men have either been inducted into the military service, or have found more remunerative employment. The lack of this supplement to organized predator control has increased the burden on the predatory animal hunters of the Service and its cooperators. Our men, unassisted, could not conduct proper control work on all affected areas. Insufficient manpower is also making it impossible adequately to control crop-destroying field rodents. The influx of workers into industrial centers and the shortage of disposal facilities for trash and garbage in these areas has added greatly to the rat control problem, as has the storage of food and feed-stuffs in improvised nonrodent-proof buildings.

Reports of severe depredations by predators and rodents continue to be received in volume, and considered in the aggregate, they present a serious picture of destruction of resources that are urgently needed in prosecuting the war. Of great interest and importance, therefore, are the operations of the Fish and Wildlife Service in reducing losses. The following instances illustrate the benefits derived from timely and scientifically applied control measures.

A Service hunter captured the coyotes that had taken an average of 18 chickens a day for some time on one farm and had destroyed 50 percent of the turkeys on a neighboring place in Martin County, Tex. Poultry and egg sales in Stonewall County, Tex., now amount to \$20,000 monthly but this was made possible in large part through the taking of 1,419 coyotes and 262 bobcats from the county since 1937. Predator depredations previously had been so severe that poultry could not be profitably raised. Previous to 1942, because of severe coyote depredations, it was impossible to produce turkeys at a profit in the vicinity of Groveland, Tuolumne County, Calif., but intensive control work permitted the raising of 5,000 in 1942; and it is anticipated that 35,000 turkeys will be produced in this area for the 1943 market. Numerous instances of the benefits of control work have been reported.

CONTROL OF INJURIOUS BIRDS

Available laboratory and field facilities were concentrated on solving or alleviating pressing problems in the control of bird depredations on agricultural crops. Severe waterfowl damage was investigated in Colorado and Idaho, and in Colorado the appraisal was made of the extent of loss. Where economically justified, measures for control of the offending birds were quickly put into effect with good results. Bird depredations upon the rice crop in California and Louisiana received special consideration. Procedures for minimizing damage were outlined and new devices for deterring the birds were developed and prepared for testing. The bird control problems of the growing army of victory gardeners also were given attention.

BIOLOGICAL INVESTIGATION OF THE FISHERIES

The nature of the fishery biological investigations conducted by the Service during the past year has been controlled by two diverse and equally urgent demands born of war conditions. Our biological investigators, because of their long association with fishermen and the fishing industry, have been peculiarly fitted to give advice and direct assistance in the all-important problem of maintaining and increasing the yield of food and essential byproducts of aquatic origin. Their

time and abilities have been extensively utilized in this wartime service. In addition, there remains the necessity of continuing the month-by-month observations of the condition of the fishery stocks and of the factors—economic and natural—which determine the future yield of the fisheries.

This twofold demand has been met as follows. To assist in staffing the Office of the Coordinator of Fisheries with competent workers, eight key biologists were detailed as area coordinators to serve in the regions in which they have been conducting fishery investigations for a period of years. Their assistants have also been called upon to aid in this work to varying extents in addition to carrying on research. Purely theoretical work on the fisheries has been abandoned, and basic research has been confined to providing information essential to maintaining production of the major fisheries. Because the war has brought violent and far-reaching changes in the fishing industry, it is more necessary than ever before to record the increase or decrease of fishing intensity and the changes in the abundance of fish stocks so that our use of the resource may be prudent and may not endanger future supplies.

North Atlantic Area.—The New England section, center of the fresh-fish industry of the country, has felt the effect of war-created hindrances to production perhaps more directly than any other area. Although figures cannot be given for security reasons, a large number of the most productive fishing vessels were requisitioned by the military services for direct war use. Since the annual production of a single large trawler is approximately 5 million pounds, this reduction of the fishing fleet has produced an inevitable effect on the quantity of fish landed. During the calendar year 1942 landings at the principal New England ports—Boston, Gloucester, and Portland—declined by 100,000,000 pounds, from 473,000,000 pounds in 1941 to 373,000,000 in 1942.

This decline has been partially offset by an increase in the production of the small boat fleets at New Bedford, Mass., and Rockland, Maine. At New Bedford, a large and important fishery for yellowtail flounders has grown up within the past 2 or 3 years, the catch increasing from about 3,500,000 pounds in 1938 to some 37,000,000 in 1942. Because the fishing grounds for yellowtails lie relatively close inshore, small boats of various types can be used in this fishery, with the result that the New Bedford fleet, in contrast to almost all others in New England, has actually increased in size since the beginning of the war. The growing importance of Rockland, Maine, as a fishery port is due largely to the booming rosefish industry, in which many small and medium sized boats, which can land at the smaller ports, are engaged.

Observations on these two rapidly growing fisheries have given rise to some concern. There are indications that the rosefish grows very slowly, which would make it particularly susceptible to overfishing. The full effects of the recent tremendous expansion of the fishery cannot yet be measured. The yellowtail stock is showing some signs of reduced abundance, with a high percentage of the available fish being removed each year.

The haddock population, on the other hand, is more abundant than at any time in the past ten years because of the reduction in the number of large trawlers. The larger spawning population which will result should insure good catches in the next several years.

To compensate for the decline in production caused by reductions in gear and manpower, the North Atlantic staff has encouraged the use of various edible species formerly discarded for lack of a market. These have resulted in increased landings of the angler-fish, raja-fish, and red hake. A wholly new industry for the canning of sea mussels was developed largely as a result of the Service's encouragement and information on available supplies. During the 1942-43 season a pack of 40,000 cases, representing more than a million pounds of food, was made. Alewives, which this year supported an important canning industry, were stocked in many suitable streams from which they had been eliminated by dams or overfishing. The program of creating runs of Atlantic salmon in streams now devoid of them also is meeting with success, judging by the large seaward migration of salmon smolts in the Pemaquid River.

Middle Atlantic Area.—Crab production, always an important industry in the Middle Atlantic and Chesapeake Bay States, assumed new significance when the war cut off the annual imports of 10 million pounds of canned crab meat from Japan. Besides furnishing general guidance to the States in maintaining a high level of crab production, the Service has conducted specific studies in an area set aside by the State of Virginia as a seasonal sanctuary for spawning crabs. The early results have been encouraging, indicating an increase in the number of spawning crabs and providing evidence that the sanctuary principle in crab conservation is both biologically and administratively sound. The crab population in the Chesapeake, as well as commercial production, has increased appreciably since the refuge was established.

A marked increase in the yield of striped bass on the Atlantic coast, especially from Chesapeake Bay to New England, occurred during the 1942 season. This was mainly the result of unusually successful spawning in Chesapeake Bay during 1940 and was similar to the period of abundance which began in 1936 as a result of a good spawn-

ing season in the same region in 1934. In accordance with a recommendation of the Service, in which the Atlantic States Marine Fisheries Commission concurred, several additional Atlantic Coast States have adopted legal size limit of 16 inches for striped bass. Compared with smaller limits, the 16-inch size insures a larger return from the resource by providing for a greater aggregate production over a longer period from each brood of fish.

Recommendations for the management of the Atlantic coast shad fishery were submitted to the State conservation departments and the Atlantic States Marine Fisheries Commission. In the Hudson River, where restoration of the shad runs has been singularly successful, the catch was increased within biological sound limits to meet the wartime need for additional food. The Hudson yielded more than 4,000,000 pounds of shad during the 1943 fishing season, compared with yields of about 3,500,000 pounds immediately before the war. In the Chesapeake Bay, where depletion of the shad fisheries has been relatively severe, the fishing rate was somewhat reduced as a result of the manpower shortage and kindred difficulties. This reduced intensity of fishing will allow more shad to spawn and should assist in restoring the population.

South Atlantic and Gulf Areas.—Major efforts were directed toward maintaining or increasing production by encouraging the marketing of previously little used species, by having certain areas opened to commercial fishing, and by assisting the industry with priority, food rationing, manpower and other wartime problems. Such duties, connected with the Office of Fishery Coordination, became practically a full-time responsibility early in March, hence biological research was of necessity curtailed and only those programs that could not be dropped without serious consequences received attention.

Pacific Area.—Biological investigations of salmon and herring in Alaska were directed toward meeting wartime demands for additional millions of pounds of fishery products from this region.

Study of the Alaska herring populations was continued and from the information obtained it was possible to predict the size and abundance of herring that will be available in the coming year and to allot quotas to permit the maximum catch without causing depletion.

Biological studies of pink salmon were continued at the Little Port Walter field station in southeastern Alaska where a two-way salmon counting weir is operated. The first completed runs from this point showed that only 2.7 percent of the pink salmon survived the period spent at sea. This knowledge was used in predicting the size of the commercial catch for 1943 and the prediction was made available to

the industry so that operations could be planned to make as large a catch as possible without endangering the stock.

In the Bristol Bay area adequate numbers of spawning red salmon were observed in many of the streams. A migration of 360,000 adult red salmon was counted through the weir at Brook's Lake, the largest run since the installation of the weir. The marking experiments on young salmon in the Naknek River system indicated the possibility of a good run of red salmon in 1945.

While handicapped by a greatly reduced fishing fleet, fewer fishermen, and fewer workers in shore plants, the pilchard industry is faced with larger demands for canned sardines, oil, and meal than ever before. In spite of production difficulties the total Pacific coast catch during the 1942-43 season was 550,000 tons—within 6 percent of the average for the preceding 5 years. The bulk of the fish were larger than in several past seasons, owing to unusual availability of pilchards 3½ and 4½ years old.

Because of the need of maintaining the yield of pilchards at as high a level as possible without endangering the future supply, the emphasis in pilchard research is directed toward devising means of measuring the resource and determining the effect of the fishery upon it.

As a consequence of wartime demands for vitamin A, intensive fisheries for certain species of sharks were carried on along the Pacific coast of the United States and Mexico. The Fish and Wildlife Service has acted as a clearing house between the several State conservation agencies on the Pacific coast in encouraging and effecting interstate collaboration in shark research.

Great Lakes area.—Production of food fishes in the Great Lakes area received a severe setback through failure of the 1943 spring fishery for smelt. Despite elaborate preparations of the Service and cooperating State and Federal agencies for the fullest exploitation of the run, this fishery, which had been expected to yield 10 million pounds, produced no more than a quarter of a million. The scarcity of smelt has been attributed to severe mortality, the cause of which is unknown.

Improved market conditions have resulted in increased yields and better utilization of carp, suckers, and other low-priced fishes.

In the Great Lakes area the manpower shortage handicapped production much more severely than did scarcity of equipment. The shortage was particularly severe in the heavily industrialized areas where the transfer of numbers of professional fishermen to war factories aggravated the condition created by the induction of large numbers into the armed forces.

The International Board of Inquiry, established in 1940 by the Governments of the United States and Canada to study methods of preserving and developing the Great Lakes fishing industry, submitted a report on its findings to the Department of State. Most significant of the Board's recommendations were those calling for unified control and continuous scientific observation of the fisheries.

Shellfish investigations.—Oyster production in the United States has declined by 50 percent from the level maintained in the 1890's. Although the Pacific coast oyster industry has made substantial growth during this period, the decline on the Atlantic coast has been so marked that the general downward trend has not been checked. Its principal cause is the system of free fishing which prevails in most of the Atlantic Coast States and which prevents full utilization of our oyster grounds.

Although the quantity and quality of oysters produced in any area can be greatly increased by cultivation, only about 13 percent of the oyster bottoms in our coastal waters are developed by scientific methods of oyster farming. Because of the objection on the part of many southern states to leasing public oyster bottoms to individuals for cultivation, the Service has developed and is advocating a system of state management of public grounds, under which oyster fishermen would cultivate and harvest the oysters under the supervision of the state. It is estimated that such a plan, put into operation on even half the public grounds, would double the yield from these beds.

In areas in which private cultivation of oysters is practiced, the Service continued its assistance by issuing frequent bulletins on the progress of oyster spawning and setting, so that growers might obtain a maximum crop of seed. Assistance was also given in protecting oyster beds against starfish, drills, and other enemies, and instances of oyster mortality due to industrial pollution were investigated.

The State of Maryland has undertaken a system of management of the oyster resources of the Potomac River, based on the Service's recommendations following a survey of this river.

At the request of the State of Texas, a survey was made of present conditions on the principal oyster grounds and numerous administrative and legislative changes were suggested to permit more efficient utilization of this resource through cultivation or oyster farming.

Comprehensive studies conducted jointly by the Service and the Washington Department of Fisheries helped to increase production of the oyster introduced from Japan in 1902. The industry has depended upon annual importations of seed from Japan, hence its existence was threatened by the outbreak of war. Methods of propagation

have now been developed by local oyster growers, giving promise of the continuance of the industry.

As part of the program to stimulate the production of oysters through cultivation, a cooperative experimental and demonstration oyster farm was established in North Carolina on North River, in the vicinity of the Fish and Wildlife Service station at Beaufort. The materials and equipment for the farm were supplied by the State of North Carolina, and supervision was furnished by the Service. Utilization of acreage in the vicinity of the demonstration farm, in addition to that which is being acquired by private concerns in other sections of the State, should yield in the next 2 years from 2 to 5 million pounds of oyster meat, create a profitable market for the large supply of seed oysters on the natural beds, and expedite establishment of an important commercial industry for future employment by fishermen.

Management of angling resources.—Sport fisheries in inland waters are known to attract more than 12,000,000 persons annually. In addition to providing recreation for large numbers of people they are a source of food especially important in wartime when, because of the scarcity of meats, it is difficult to provide a balanced diet. For various reasons there has been a progressive decline in the abundance of game and pan fishes and it is the purpose of Service investigations to develop methods of management which will assist in maintaining and improving the angling resources of our lakes and streams.

A 5-year study of experimental fish management in the Pisgah National Forest in North Carolina and other carefully controlled experiments in the Sierra Nevada Mountains in California show that it is possible to plant too many fish. Overstocking, it was found, increased the demand for food far beyond the available supply, with disastrous effects on both the planted and native trout populations. Large plantings of young fish in the fall were largely lost and did not materially affect the catch in later years. Legal-size fish planted in the spring in numbers adjusted to the available food supply and the size of the resident trout population, on the other hand, resulted in an increase of about 300 percent in the number of fishes caught.

The farm fish pond assumes especial importance in wartime when home production of food is more necessary than ever and the scarcity of other meats emphasizes the value of fish in the diet. Furthermore, land which is of little value for other purposes may frequently be utilized for ponds and brought into a high state of production. Appreciating these facts, the Service has devoted much time and effort to the development of better methods of pond management. The amount of edible fish produced in any body of water depends very

largely on the methods employed in operating the pond and experiments are now in progress to show the way to better management. The largemouth black bass and the bluegill sunfish appear to be the species best suited to farm ponds but they must be present in proper proportion for good results. Experiments at Leesville, Va., and Welaka, Fla., indicate that the best ratio of sunfish to bass is 8 or 10 to 1, instead of 15 to 1 as usually recommended.

One of the most important problems in pond culture is the control of objectionable vegetation which may make the pond unfishable and decrease its productivity. In the past, control of pond weeds has involved the laborious and expensive method of removal by hand. Later it was found that vegetation could be controlled by application of copper sulphate and sodium arsenite. This method has proved very effective in farm ponds. A further advance is the discovery that the coarser aquatic plants can be controlled indirectly by the use of certain inorganic fertilizers. These fertilizers promote the growth of filamentous and "water bloom" algae which smother the weeds and prevent their growth.

Fish protection and engineering developments.—For the past years the supply of salmon in the Columbia River has steadily declined, presumably as a result of the combined influence of overexploitation and the interference of dams and diversions of water. Statistical studies of the commercial catch records have been made to determine the present status and trend of the resource. A survey of the spawning and rearing areas of the Columbia River watershed near completion during the year. It included: spawning potentialities, needs for fish protection at dams and diversions, and the present status of the salmon population. Upon the basis of the findings, programs of fish protection and rehabilitation are prepared. Much attention has been given to salvaging the runs of salmon that forked and spawned above Grand Coulee Dam by transplanting them to tributaries below that point. The success of this program depends on the return of the fish at maturity to the tributaries into which their parents were transplanted. Accordingly, marking experiments have been conducted to determine the accuracy of homing. Other marking studies have been designed to ascertain the relative merits of various hatchery procedures, particularly the length of the rearing period. The large-scale operation of hatcheries in the salvage program has introduced unprecedented problems of nutrition and disease control which have been the subject of extensive investigation. Many of the findings have already been applied.

Preservation of the salmon resources of the Sacramento River, threatened by the construction of Shasta Dam, continued to receive the Service's attention in cooperation with the Bureau of Reclamation. A comprehensive report has been prepared on the work of the last years. The situation on the Sacramento reached a critical stage in November 1942, when the Shasta Dam became an impassable barrier to salmon migrating upstream. Because of the height of the dam, it is not feasible to provide fish ladders as was done at Bonneville and a salvage plan has been developed. This involves the transfer of most of the early run fish to Deer Creek, a tributary of the Sacramento River, where they will be allowed to spawn naturally. The remainder of the spring-run fish and the early part of the fall run will be held in the ponds in Battle Creek and spawned artificially. The greater part of the salmon ascending the Sacramento in the fall will be held between racks constructed in the river over gravel beds suitable for spawning. Observations during the spawning season of 1942 showed that many salmon spawned successfully on these beds.

Pollution studies.—Among establishments vital to the war, munitions factories, plants manufacturing cellulose derivatives, distilleries producing industrial alcohol from grains, petroleum refineries, and even shipyards are discharging voluminous effluents that create new pollution problems in many localities.

With the continued cooperation of the War Department, investigations of conditions produced by these effluents and laboratory studies of the toxicity of the wastes and means of denaturing them have been the major tasks of the Water Quality Laboratories of this Service during the past year. Where feasible, recommendations for control have been made to the proper authorities. Investigations of various new effluents are now in progress and reports on acetylene wastes, metal scourings, and several munitions effluents have been completed.

In addition to studying wartime pollution, units of this Service have cooperated extensively with the State of Mississippi in a pollution-abatement program, and with the Republic of Colombia on special problems. A new and very accurate method of bio-assay of effluent toxins has been devised and measurements made of the peculiar and detrimental oxygen demand of oil films.

WILDLIFE CONSERVATION LAWS AND REGULATIONS

Wildlife-conservation statutes administered by the Service include the: (1) Lacey Act, (2) Migratory Bird Treaty Act, (3) Migratory Bird Conservation Act, (4) Migratory Bird Hunting Stamp Act, (5) Black Bass Law, (6) law protecting wildlife and property on Federal

refuges (sec. 84, Criminal Code), (7) Bald Eagle Act, and (8) through the Alaska Game Commission, the Alaska Game Law of 1925, as amended.

Major amendments to the Migratory Bird Treaty Act regulations in 1942 lengthened the season on waterfowl from 60 days in 1941 to 70 days, permitted hunting each day from sunrise to sunset, and provided for possession of legally killed birds for 30 days after the close of the season.

The 69 salaried Federal game law enforcement officers, working alone or in cooperation with state conservation agents and United States deputy game wardens, obtained convictions of 2,567 violators of wildlife protection statutes, resulting in fines totaling \$75,215.26 and jail sentences of 2,826 days (table 2).

TABLE 1.—Cases of violation of the Migratory Bird Treaty Act disposed of during the year and cases still pending on June 30, 1943

<i>Disposition</i>	<i>Number</i>	<i>Pending</i>	<i>Number</i>
Conviction.....	383	From preceding year.....	109
Dismissal.....	65	New cases.....	419
Nol-pros.....	15		
Found not guilty, jury trial.....	41	Total.....	588
Closed without prosecution.....	15		
No bill rendered.....	3	Disposed of.....	524
Closed by death.....	2		
		Pending at end of year.....	64

¹ Also, 300 days suspended in 4 cases and probation for 3¼ years in 21 cases.

² Also, 2,730 days suspended in 8 cases.

³ Probation.

⁴ Suspended.

⁵ Also, 1,126 days suspended in 25 cases.

Reduced travel by civilians has resulted in a corresponding reduction in the number of permits issued for the importation of live wild birds and animals. However, service men returning from overseas

are bringing home many birds and animals as pets. Importation permits issued during the fiscal year were 751 as compared with 1,371 for the preceding year. Birds imported last year numbered 56,211. This year only 27,731 were entered of which 15,000 were quail from Mexico for restocking purposes. A request for a permit to import chaffinches (a prohibited species) was denied. The total number of animals imported was 5,880, of which 3,675 were Rhesus monkeys to be used in scientific experimentation, and 32 were black bears.

Scientific collecting permits were reduced in numbers from 1,779 to 1,510. Only 97 new permits of this kind were issued. There was a corresponding reduction in the number of outstanding scientific possession permits from 604 to 563. New scientific possession permits were issued during the year to 22 persons. Permits issued to take birds and mammals in Alaska for scientific purposes numbered 20. There was practically no change in the number of bird-banding permits, which on June 30 numbered 2,390.

Permittees reported raising in captivity 2,668 wild geese, and 49,943 wild ducks, of which 46,827 were mallards. Other species raised included black ducks, wood ducks, pintails, green-winged teals, and red-heads. The Nation's meat supply was increased by the sale of 19,391 of these ducks and 379 geese for food. Migratory waterfowl sold for propagating purposes included 4,741 ducks and 867 geese. In addition, 6,481 ducks and 178 geese from game farms were liberated.

Permits issued to protect crops from depredations by birds numbered 688, but only a few of these authorized the actual killing of the birds, and then, only after frightening devices were found to be ineffective. To abate crop damage in Colorado, an order was issued to permit the taking of mallards only from December 24, 1942, to January 31, 1943 on agricultural fields in a few areas within the State.

One whaling shore station and three catcher or killer boats were licensed to take and process whales on the California coast, for which \$1,250 in fees were collected and deposited in the United States Treasury.

ENFORCEMENT OF THE ALASKAN GAME LAW

The Alaska Game Commission employs 23 persons, who, with the executive officers, operate 5 planes, 3 sea-going vessels, 17 motor vehicles, and numerous inboard and outboard motor crafts in the enforcement of the game law throughout the Territory.

Cooperative patrols were made with the Royal Mounted Police of Canada to prevent smuggling of high-grade furs. Valuable service

was given to the Army, Navy, and law enforcement agencies in the furnishing of expert knowledge regarding the Territory, its people, climate, and terrain.

Wildlife protection problems in the Territory increased in proportion to the great influx of men in the armed forces and workers on the Alaska Highway. However, these problems were soon largely solved by intensive patrols, arrests, speedy convictions, and cooperation of the military authorities and superintendents of road camps.

During the year 133 persons were convicted for violation of the game laws. Their fines and sentences totaled \$3,765 and 810 days in jail. In addition, they forfeited furs, boats, guns, and traps having a value in excess of \$12,000. Fifty percent of the receipts of the Alaska Game Commission are covered into the Territorial school fund, and the remainder is deposited in the Treasury of the United States.

The Game Commission began its annual meeting in Juneau on January 22. Policies were formulated, regulations were discussed, and the official stations of some of the wildlife agents were changed in response to shifts in populations. Following the meeting, the executive officer conferred with Service officials in Chicago and Washington, D. C., regarding the conservation and development of the Territorial wildlife resources.

ADMINISTRATION OF ALASKA FISHERY LAWS AND REGULATIONS

The Fish and Wildlife Service, which is charged with the responsibility for regulating the time, place, and method of commercial fishing in Alaska under the authority vested in the Department by the act of June 6, 1924, continued its established program for the management and conservation of the fisheries to assure a stabilized maximum yield. Vigilant control over these valuable resources is necessary to prevent unwise exploitation at any time; in a period of emergency which might well extend beyond the anticipated duration of the war into a post-war period, when food requirements will be great, the need for such control is doubly important. Careful observation of fishery runs and escapements in an effort to assure maximum utilization of the resources without endangering the future supply is of the greatest importance. As a result of this management program, seasonal opening and closing dates, weekly closed periods, and gear restrictions, were adjusted from time to time to permit additional catches of salmon and other fishes in such quantities as observations indicated were wise.

Because of travel conditions, no public hearings were held on the Pacific coast on proposed changes in fishery regulations, though such hearings are customary. In the circumstances the industry was invited to submit recommendations for changes in the regulations to the Director of the Fish and Wildlife Service for consideration in the preparation of the 1943 regulations.

In protecting the fishing grounds, eight patrol vessels and five small high-speed boats were used in 1942, effectively supplemented in several districts by Government-owned airplanes. Four of the patrol boats previously used in this work were taken over by the armed forces. The personnel identified with fishery protective work numbered 105, as compared with 190 in 1941. They included fishery management agents, stream guards, weir operators, vessel crews, and biologists. In addition, nine wildlife agents of the Alaska Game Commission, deputized to enforce the Alaska fishery laws and regulations, were active during the fishing season in patrol work.

Weirs for counting escapement of spawning salmon were operated in seven representative streams, and biological investigations concerning the salmon and herring were continued on a limited scale.

Although every effort was made by the Fish and Wildlife Service to insure the maximum possible utilization of fishery products consistent with conservation requirements, in order to meet heavy demands especially for canned salmon for military rations and for lend-lease requirements, the yield of these products did not reach the high level of 1941. The principal causes for the decreased production in 1942 were manpower shortages, transportation difficulties, loss of floating equipment by operators to military agencies, and to a great extent, actual military operations in parts of central and western Alaska which prevented full-scale fishing.

Plans have been tentatively formulated for post-war activities in connection with the management of Alaska fishery and fur-seal resources. Briefly, they will include more efficient patrol facilities; bases in Alaska for repair, maintenance, and storage of patrol vessels; investigations of fishery resources now not utilized; an extensive program for the improvement of existing spawning areas and their tributary waters; and expansion of the Government-owned byproducts industry on the Pribilof Islands to include a plant on St. George and an enlarged factory on St. Paul Island where fur seal carcasses and blubber may be reduced to valuable meal and oil.

The total output of Alaska fishery products in the calendar year 1942 was 306,013,424 pounds, valued at \$56,507,699, compared with 431,125,520 pounds, valued at \$63,477,295 in 1941. The estimated

value of the catch to the fishermen was about \$17,429,700, or more than 2 million dollars more than in the preceding year. The number of persons employed in the various branches of the fisheries was 23,216.

Salmon products represented about 83 percent of the weight, and about 90 percent of the value, of Alaska fishery products in 1942. Almost 93 percent of the salmon products consisted of canned salmon, the pack amounting to 5,075,866 cases, or 236,524,688 pounds, valued at \$48,298,913. Compared with the pack in the preceding year, the output of canned salmon in 1942 showed a decrease of about 27 percent in quantity and about 14 percent in value. One hundred canneries were operated, nine less than in 1941, and the number of persons employed decreased from 21,994 to 19,946.

In the herring industry, the number of operating plants was reduced from 13 in 1941 to 4 in 1942. This decrease was due to curtailed operations in southeastern and western Alaska and to consolidation of those in central Alaska. Production of salt herring and oil and meal was substantially reduced.

Halibut landed by the Alaska fleet, which comprises American vessels landing more than half of their catches at Alaska or British Columbia ports rather than in the United States, totaled 25,387,000 pounds, valued at \$3,555,000. In 1941, comparable figures were 15,984,120 pounds of halibut valued at \$1,552,658.

Several of the minor fisheries showed a considerable gain over the previous year due to increased demands, especially for trout, sablefish, sharks, and clams, but the catch of cod, flounders, rockfishes, "lingcod", and shrimps declined to a marked degree.

NATIONAL WILDLIFE REFUGES

Despite the war and its checking effect on the national wildlife refuge program through the loss of trained personnel and of funds such as formerly had been expended in furtherance of the program, the wildlife refuges have played an important part in the Nation's wartime economy. The complete shut-down of CCC camps, WPA projects and other work relief programs, and the restrictions on construction to save critical materials for war necessitated drastic changes in the job of developing lands for wildlife.

Personnel turn-over has been high, and approximately 20 percent of the trained men of the Division of Wildlife Refuges have gone into the armed forces or into defense industries. While the services of these keymen have been lost to us for the duration, the training program of the Division has enabled us to replace them with subordinates.

Fire protection of valuable timber and grazing resources, forest industries, and strategic facilities on refuge areas was placed high on the list of major objectives and a special allotment of funds under the Sixth Supplemental Defense Act of 1942 enabled us to keep fire losses in forest and grazing areas to a minimum in the zone in which its expenditure was authorized. However, the loss of CCC and WPA personnel in forest fire suppression activities was keenly felt.

Flood damage of serious proportions resulting from heavy precipitation occurred on refuge developments in the West and Middle West, and in some instances extensive, costly repairs are necessary in order to replace damaged structures, dikes, and other water-control facilities.

As a result of management studies, it has been found possible to permit increased utilization of range lands within waterfowl breeding areas without reducing production on the nesting grounds. As a matter of fact, the more abundant rainfall in the Northern Great Plains region has so increased the density of nesting cover that light fall and winter grazing of nesting habitat has been found desirable in maintaining the coverts in a condition most favorable to the waterfowl. These modifications are of particular significance during the present national emergency when there is an increased demand for meat production.

Protective maintenance measures have resulted in extending the life of such equipment as trucks, cars, tractors, and draglines; and the restricted use of automobiles and the release of thousands of tires by the Service have undoubtedly been a material aid in the rubber conservation program.

The following areas were established as national wildlife refuges during the year: Chassahowitzka, an area of 3,156 acres in Hernando County, Fla., designated for the protection of migratory waterfowl (Public Land Order, June 15, 1943); Slade, an area of 3,000 acres in Kidder County, N. Dak., acquired through the bequest of the late George T. Slade, noted wildlife conservationist; Chincoteague, 8,809 acres of some of the finest resting and wintering waterfowl lands in Accomac County, Va.; and Skagit, an area of 2,518 acres in Skagit County, Wash., for resting and feeding waterfowl.

The Hailstone National Wildlife Refuge, an easement area of 2,655 acres in Stillwater County, Mont., for breeding waterfowl, has been administered as a refuge for some time but was only recently covered by Executive order (E. O. December 31, 1942).

One public land order, June 18, 1943, revoked the Matanzas National Wildlife Refuge due to a decision by the General Land Office that no Federal lands were included.

TABLE 3.—*Classification and acreage of national wildlife refuges administered by the Fish and Wildlife Service, June 30, 1943*

Classification	Number	Acrea
For migratory waterfowl.....	188	2,971,381
For other migratory birds and general wildlife.....	25	3,982,589
For colonial nongame birds.....	44	185,677
For big game.....	16	10,578,050
Patuxent Research Refuge, Md.....	1	2,623
Total.....	274	17,630,320

¹ Decrease under last year's tabulation due to dropping Siskiwiit Refuge, Mich. (added to the Isle Royale National Park), Matanzas Refuge, Fla. (General Land Office decision), and to the more accurate calculation of project acreages.

² Decrease under last year's tabulation due to more accurate calculation of project acreages.

Land Acquisition.—Because of the war's effect on land acquisition, most noticeable through the demands for extensive areas by the War and Navy Departments with the consequent need for land valuation engineers, there has been a slowing in the purchase of refuge lands. Marked increases in land prices have also been a retarding factor in refuge-land acquisition. Consequently, such purchases as have been made were almost exclusively limited to those adjacent to lands already in possession to insure their better control.

Although operating with a substantially smaller staff, much attention has been given to the legal and technical prerequisites to the vesting of titles in the United States of previously optioned lands and to the preparation of material for Executive orders establishing the refuges.

The Migratory Bird Conservation Commission approved the acquisition of 13 tracts on 6 refuges, totaling 5,819.26 acres and the lease of 3 tracts on 3 refuges, totaling 3,528.53 acres in 7 States. Most of these lands were urgently needed for the effective completion and administration of existing refuges.

During the year, titles have been vested in the United States to 73 tracts containing 36,378.39 acres in 18 States, and cadastral surveys have been made of 60 miles of refuge boundary and necessary subsidiary lines.

More than 497,500 acres of lands and the crops and physical improvements thereon have been examined, appraised, and type mapped for the Navy Department, the values determined amounting to \$12,116,347.46. For the same Department, 54 miles of boundary and subsidiary lines were resurveyed, and topographic surveys were made of 2,552 acres of land.

Personnel have also been called by the Department of Justice to appear as expert witnesses in the prosecution of condemnation proceedings directed toward the acquisition of certain of these lands.

ECONOMIC INVESTIGATIONS OF WILDLIFE RESOURCES

To assist in the conservation of food and other resources, investigations to improve the methods and materials used in the control of destructive animals were carried on, as were also studies for the improvement of the management of waterfowl, upland game, and other wildlife.

Control methods.—Intensive search was made for substitute rodent and predator poisons to replace strychnine, red squill, and thallium. The war has resulted in a shortage of these materials which formerly were imported in large quantities from French Indo-China, North Africa, and Germany, respectively. A large number of organic and inorganic toxic chemicals was obtained or synthesized for bio-assaying and field testing. Extracts were procured or prepared from numerous native and South American poisonous plants. A few of these have proved to be very toxic and, therefore, worthy of further investigation. In locating new materials, cooperation was obtained from several industrial chemical concerns and drug manufacturers and from various research organizations engaged in the hunt for new toxic agents for other types of pest control.

Good progress was made in adapting one of the newer poisons, zinc phosphide, for control of rats and field rodents. This compound is now in use in various western areas as a substitute for thallium. Other promising new or substitute materials are being extensively tested under field conditions.

Constant effort is being directed toward making highly selective the methods used in control of injurious mammals, and gratifying progress has been made. It was found that birds can be deterred from feeding on poisoned rodent baits by treating the cereal ingredient with a brilliant dye. This treatment does not alter the acceptibility of the bait to rodents, but makes it unattractive to ground-feeding birds. A number of new deterrents were tested to determine their value in protecting packaged foods, ship calking, telephone cables, and insulating material from rats and other rodents.

The practicability of combining an emetic with poisoned baits for rats was successfully demonstrated. This finding is expected to have far-reaching effect in operational rat control as the exposing of rat poisons so treated will be much less dangerous to dogs, cats, and other pets.

Red squill supplies.—The application of the red squill fortification process developed in 1941 continues to widen. The city of New Orleans' fortification plant, built according to Service specifications, is operating successfully, making possible the conversion of large quan-

tities of low-grade squill into a usable control product. Without fortification, much of the squill imported has a low raticide value. The British and Chinese governments, at their requests, have been supplied with specifications for construction and operation of fortifying plants.

The propagation of red squill in this hemisphere received further impetus through consummation of an agreement with the Bureau of Plant Industry, Soils, and Agricultural Engineering, and through initiation of a propagation program in Mexico by the Board of Economic Warfare. In connection with these developments the Service is giving technical assistance pertaining to the toxicity of squill stocks, and to the use of squill in rat-controlled programs.

Marsh management.—Coastal dim-out regulations forced the abandonment of continuous 24-hour burning as a marsh-management technic in the Gulf Coast region. After demonstrating the need for controlled marsh burning to increase the growth of desirable vegetation as food for cattle, fur animals, and other wildlife, limited approval for such operations was obtained from defense authorities. Continued progress was made in demonstrating the utility of regulated grazing on Gulf Coast marsh areas dedicated to wildlife preservation. Assistance was given to interested groups in the development of new war-time markets for marsh products and byproducts.

Control of pest plants.—Giant cut-grass (*Zizaniopsis*), a troublesome pest in southern marshes, was found to be 90 percent controlled by one under-water cutting during the period of maximum runner growth, which, in the latitude of Reelfoot Lake, Tenn., is usually in late August. Spatterdock (*Nymphaea*) was 85 percent controlled by under-water cuttings in June, late July, and August. More than 90 percent control of lotus (*Nelumbo*) was accomplished by one under-water cutting in water 5 feet deep during the period of maximum flowering. The planting of desirable competitor species following control was the subject of experiment to determine its practicability as a measure for preventing or retarding return of pest species. Granular 48 percent muriate of potash gives promise of being valuable for control of a common rush (*Juncus acuminatus*), which is sometimes a weed pest in shallow ponds.

Propagation of waterfowl foods.—The effects of various commercial fertilizers on the growth of important duck foods were investigated under controlled conditions in experimental ponds. Light fall burning was found to stimulate germination of seeds of a variety of important moist-soil grasses and sedges.

Upland game-bird management.—Technical assistance was rendered to the game departments of 18 States in connection with their upland game development and research programs. Diets for the bobwhite

oil consisting of materials available under wartime conditions were formulated and tested.

Wildlife of forest and range.—Investigations of forest-game management practices in the Southeast with emphasis on the preservation of the wild turkey were concluded. In cooperation with the State of Texas, investigations were begun of land-management and grazing practices affecting economically important game resources in the Edwards Plateau, the center of the Nation's mohair industry.

A study of overpopulated deer range in Nevada yielded information which management recommendations were made to the Nevada Game Commission and to the Federal Forest Service. Sample areas showed an average of 4 and 16 deer per 100 acres on summer and winter ranges, respectively. On wide areas, livestock and deer ranges are seriously overutilized.

Pocket gopher investigations on the Grand Mesa, Colo., in cooperation with the Forest Service, determined average populations of 21½ per acre on meadows, 8½ on sagebrush types, and 30½ per acre on open parks. These rodents, on the basis of test plots, were taking as much forage as the allotted range cattle. The costs of control may prove uneconomic unless slow population recovery justifies spreading the operations over several years. Long-time projects in Mississippi, Oregon, Montana, California, and Arizona were placed on a maintenance basis for the duration of the war.

FUR ANIMAL PRODUCTION

Because of the war, basic research in reproduction, nutrition, and fur fibers has been greatly reduced. A special effort is being made, however, to keep the work alive so that continuity can be maintained. During the 1943 breeding season, experiments were conducted to determine whether delayed implantation is a controlling factor in the length of gestation in mink. Investigations were continued to determine the optimum time in the ovulation period to breed foxes. The unit at Swarthmore College cooperated with the U. S. Fur Animal Experiment Station at Saratoga Springs, N. Y., on this work.

Nutrition studies.—Work was continued at Cornell University, Ithaca, N. Y., to learn more about possible substitutes for raw meat in the rations of fur animals. Raw carcasses of foxes proved entirely satisfactory when comprising 25 percent of the ration.

Preliminary results obtained with the nitrogen balance method indicate that the amount of protein in the ration necessary to maintain equilibrium in foxes lies between 7 and 10 percent. The minimum requirement of thiamin chloride (B₁) necessary to prevent B₁ deficiency symptoms in the fox lies between 0.7 and 0.8 gm. per gram of

dry food. The U. S. Fur Animal Experiment Station, Saratoga Springs, N. Y., cooperated with the Cornell unit to make these determinations. The minimum requirements of calcium for growing pups were tentatively determined to be between 0.4 and 0.5 percent of the ration. The vitamin-A requirements of growing pups were studied with 70 animals after a depletion period of 29 to 41 days.

Fur fiber studies.—In cooperation with the Bureau of Animal Industry, studies were continued on the fur fiber characteristics associated with woolliness in domestic rabbits.

Karakul fur investigations in cooperation with the Bureau of Animal Industry have been continued on a very reduced scale. The final step of one phase of the breeding program was taken this year in the production of broadtail lambs by crossing the Karakul and Navajo sheep. The pelts produced were of good quality.

New York fur animal experiment station.—The scarcity of animal proteins seriously affects the production of fur animals as the food is largely composed of meat and meat products. Experiments were conducted at the station near Saratoga Springs during the past year to adapt rations of fur animals to the present emergency conditions. It was found that beef meal can be used to replace half the raw meat in the summer mink ration. Preliminary studies indicate that soybean meal, cotton seed meal, corn gluten meal, and peanut meal can be similarly recommended.

Maryland fur animal field station.—A 5-page leaflet on "Recipes for Cooking Muskrat Meat" proved useful in the Service's campaign for increasing the use of the meat of furred game. The 6,000 muskrat carcasses graded and sold from the 5,233-acre marsh area near Cambridge, Md. brought as much as 35 cents per carcass wholesale in the Baltimore market. Approximately 60 mature muskrats, 10 nutria, and 4 raccoons are maintained in pens at the station for controlled experiments. A total of 49 litters of muskrats was born in pens during the year, the number of litters per female running from one to four in a season. The period for gestation for muskrats is believed to be 28½ days.

California rabbit experiment station.—Results from experimental work and cooperative relationships already established furnished the basis on which was developed a program for increased rabbit production. Rations containing less protein and a smaller proportion of concentrates are being studied. Hutches and accessory equipment construction requiring less critical materials are being emphasized. Studies have been made of the food conversion ability of rabbits of various ages, the effect of the woolly carrier on pelt values, cause of sore hocks, and malocclusion of teeth.

The staff at the station has devoted considerable time to answering correspondence and supplying information to those interested in raising rabbits to supplement the dwindling family meat supply. Informative material was sent to every State in the Union and to 30 foreign countries.

WILDLIFE DISEASE INVESTIGATIONS

Fur animal diseases.—Tests of six species have been conducted to determine the susceptibility of wild animals to distemper virus and thus ascertain whether they may serve as carriers of the disease. Muroid enteritis kills many domestic rabbits, and every effort is being made to determine the cause of the disease and to prevent losses from it.

Game bird diseases.—Control of avian botulism, the most devastating of waterfowl diseases, is being attempted on an experimental basis at various Federal refuges through manipulation of water levels. The value of salvaging the affected waterfowl was demonstrated conclusively by comparison of mortality figures for sick birds that had been hospitalized, banded, and released and for those that had not been hospitalized before released. The former show a much higher rate of complete recovery.

Demonstration was made of botulism toxin in the blood stream of sick ducks picked up in the field. By the use of movable duck cages it was possible to demonstrate the presence of toxin in very shallow water which was rich in organic matter. Likewise maggots from birds that had died of botulism were found to be highly toxic and the soil under the carcasses was found to remain toxic for more than 40 days. Studies were also made on the relationship of other soil and aquatic organisms to the botulism bacteria.

Identification of the causative agent of quail rhinitis as a filterable virus verifies a theory of long standing as to the nature of this infection. Cultivation and serial transmission on chick embryos provides means for the development of prophylactic control measures.

COOPERATIVE WILDLIFE-MANAGEMENT RESEARCH

The 10 widely distributed Cooperative Wildlife Research Units were chiefly engaged during the year in surveying game populations, estimating surpluses that could be safely taken for meat and fur, studying game depredations upon farm and range crops, and investigating factors affecting game supplies. Of 87 projects, 23 were completed and 38 were suspended because the investigators entered the armed forces. Research, training, and extension programs were actively carried on in Alabama, Iowa, Maine, Missouri, Ohio, Oregon, Pennsylvania, Texas, Utah, and Virginia, at the land grant colleges,

cooperating with the State game commissions and the American Wildlife Institute. Unit leaders acted as advisors to State game departments on conservation matters. In cooperation with the Texas Agricultural Extension Service, a 5-year wildlife extension program was completed in 221 of the 254 Texas counties, with more than 36,000 owners participating on approximately 21 million acres of land.

MIGRATORY BIRD INVESTIGATIONS

The waterfowl situation.—Continued favorable climatic and environmental conditions, and adherence to a sound management policy, have resulted in further increases in the continental population of ducks and geese. In 1943 fall migration of these birds should be the largest in several decades. Shortage of ammunition and transportation, the departure of many hunters for the armed services or the war industries, together with other factors, are likely to reduce hunting pressure. In consequence, prospects are excellent for the building up of a stock of birds that will fully occupy the available habitat. Because of this there is a pressing need to provide adequate winter quarters where food supplies will be ample. This condition is particularly acute on the Atlantic and Mississippi Flyways.

Investigations in Canada.—Despite difficulties encountered in reaching (without the aid of automotive transportation) the out-of-the-way lakes, marshes, and river valleys that are frequented by waterfowl, the biologists of the Atlantic and Mississippi Flyways succeeded in covering important concentration areas in the Maritime and Prairie Provinces of Canada. Much of the success of the waterfowl operations in that country must be gratefully attributed to the wholehearted cooperation of Dominion and Provincial game officials, and to others interested in the welfare of the birds. In addition to the information obtained directly by the Service biologists, the Canadian National Parks Bureau has made available the reports of its officers stationed in the Prairie Provinces and in British Columbia.

In Manitoba, Saskatchewan, and Alberta there were some losses caused by nest flooding, late freezes, and predatory animals, but the total was far less than losses a few years ago from drought. The biologists conclude that the prairie region of Canada has a substantial increase in its population of ducks and geese. Similarly, high water in the Maritime Provinces did some damage to early nests of the important black duck, but renestings were sufficiently numerous to produce a normal crop. An increase of waterfowl also was recorded in British Columbia.

The leader of the Maine Cooperative Wildlife Research Unit, operating in Quebec and New Brunswick during the month of August

1942, submitted a report upon the comparative status of the waterfowl in these two Provinces. While Quebec is not known to have extensive breeding grounds, there are important nesting areas in New Brunswick. Unmistakable evidence was found of a continuing increase in the number of ducks, particularly of the blue-winged and green-winged teals.

Investigations in Newfoundland.—In collaboration with the Department of Natural Resources of Newfoundland, two biologists of the Service worked in this crown colony during the month of June 1942, obtaining series of specimens and useful information on the avifauna of the island. Important elements of the Canada goose population of the Atlantic Flyway appear to have their breeding grounds in this region.

Investigations in Alaska.—Through the cooperation of the Alaska Game Commission, the biologist formerly assigned to the Mississippi Flyway, but now attached to that agency, was transported by air to the delta of the Yukon River where headquarters were again established at the village of Chevak. Work on the great waterfowl breeding grounds was just under way when it became necessary to suspend operations and send the Service representative to Washington on an urgent mission. Subsequent information, gathered by agents of the Alaska Game Commission, indicated that the numerical status of the Alaskan population of breeding waterfowl was generally satisfactory although the supply of geese appeared to be somewhat below normal.

Investigations in Mexico.—For the purpose of filling a gap in our knowledge of waterfowl wintering grounds in Mexico, the biologist of the Pacific Flyway devoted 6 weeks to a survey in the State of Chihuahua. The number of ducks and geese wintering in that district does not appear to be large and its importance is much less than that of previously surveyed areas on both coasts and in the Valley of Mexico. It is, however, one of the chief wintering grounds of the sandhill crane, a migratory game bird that for many years has been accorded complete protection, and has distinctly increased in numbers.

The biologist of the Central Flyway, from his headquarters at Brownsville, Tex., made several short trips into the State of Tamaulipas to study the wintering waterfowl in the Mexican portion of the Laguna Madre. War conditions made it necessary to dispense with aerial surveys over coastal areas of this country.

Investigations in the United States.—Breeding grounds in the northern United States continued in excellent condition. Abundant water filled sloughs and pot holes that had been dry for years. These additional nesting areas resulted in a greater dispersal of the birds so that on some of the refuges there appeared to be a reduction in

numbers. This necessitated extending investigations to adjoining areas.

Seasonal comparisons of the constantly increasing numbers of ducks and geese have become increasingly difficult, probably because the average observer, while fully competent to estimate the size of flocks that may contain only a few hundred individuals, finds such estimates extremely difficult for flocks composed of many thousands. The fall migration of 1942 was reported on by 305 observers, and the spring flight of 1943 by 252. Analysis of these data aided materially in appraising the status of the different species.

During the winter months and the migration seasons the flyway biologists maintained continuous surveillance on the great flocks of ducks and geese that annually gather in the South Atlantic and Gulf coasts and in the interior valleys of California.

Despite war conditions, both the Navy and the Coast Guard were able to render splendid cooperation in the taking of the annual inventory in January, furnishing sufficient aviation to assure coverage of most coastal areas. As a result of this operation it was estimated that the continental population of ducks and geese has increased to between 115 and 120 millions. A few species, such as the redhead and the ruddy duck, while showing gratifying increases, are still below the desired levels.

Status of other migratory game birds.—Investigations of the woodcock were continued in Maine and Pennsylvania, and in the Canadian Provinces of New Brunswick, Nova Scotia, and Prince Edward Island. While numerical recovery of this bird from the low point of a few years ago, now seems assured, nevertheless it is also apparent that wise management demands very cautious utilization.

Such data as were obtained indicated a further decrease in the number of the Wilson's snipe. From only two States, Florida and Louisiana, was there any evidence of a possible increase.

The mourning dove, on the other hand, is making a most gratifying recovery, particularly in the East where its numbers have been at low ebb. They are, however, still much below the optimum desired.

Due to the necessity for detailing the biologist of the Central Flyway to part-time work with the Office of the Coordinator of Fisheries, the investigation of the white-winged dove in Texas has been extended throughout the breeding season of 1943. Work with the western race in Arizona has been rounded out by a special study made during the summer of 1942 in the Mexican State of Sonora. As a result of this research, better management of the species should be assured.

Banding game and other birds.—The banding work has been severely restricted as a wartime economy. Many volunteer cooperators have

entered the armed forces or by virtue of their occupation in war industries have been obliged to close their stations temporarily. New permits have been issued only in exceptional cases and practically all work with species that nest in colonies has been suspended in order to conserve bands urgently needed for work with game birds. Nevertheless, the 1,700 cooperators reported the banding of 177,898 birds, of which 30,783 were ducks and geese. The grand total of birds banded since the beginning of the work is 4,528,241. Returns and recoveries totaling 22,774 brought the total of these data to more than 315,000. This file is a veritable "treasure trove" of new information regarding North American birds and is being widely used for a variety of purposes.

Distribution and migration records.—Two hundred and eighty-six volunteer observers sent in 36,210 migration observations to be incorporated with the already vast and invaluable collection of this material. In addition, 630 locality, and 710 publication, references were added to the files.

BIOLOGICAL INVESTIGATIONS OF WILDLIFE

National park wildlife.—Study of beaver-elk relationships in Rocky Mountain National Park shows that the numbers and distribution of beavers are controlled, to some extent, by elk since the latter relish aspen on which beavers are dependent. Maintenance of natural areas in which beavers may work out their own destiny should prove valuable as a check on trapped areas and on domesticated fur animals. Since serious overpopulations of deer exist on certain areas in Kings Canyon and Sequoia National Parks, the need for trapping is indicated to prevent further damage to browse plants. Data were supplied to the National Park Service regarding wildlife of Jackson Hole National Monument, particularly in relation to the adjacent National Elk Refuge and the need for reduction of the southern elk herd.

Surveys were made of winter range for elk and other large mammals in Yellowstone National Park and elk reduction methods were studied at first hand in order to get information for use in future management plans for the northern elk herd. Range conditions in Rocky Mountain National Park are not as bad as in Yellowstone but show heavy use by deer and elk which are cut off from their former winter range outside the park. Reduction of the number of sedentary individuals by official means within the park appears necessary. A survey of pack and saddle stock grazing in a primitive section of Kings Canyon National Park showed that range conditions are, in general, good.

An inventory was made of rare fur-bearing and other mammals in border areas of Kings Canyon National Park, adjacent to the trap-

ping district. Possibilities for development and recreational use of wildlife at Denison Dam and Reservoir, Texas-Oklahoma, were studied. Information on wildlife resources of the Alaska Highway will be used in planning development of a protected strip along the road in Alaska. Investigation was made of moose and other wildlife of Isle Royale National Park.

Assistance was given in preparation of the National Park Service's report on present and potential contribution to the departmental food production program and in carrying on that for increased utilization of grazing and general agricultural resources. Study shows that sizable meat contributions have been and can be made through official slaughter of elk, deer, and buffalo to remove existing surpluses.

Investigation of aquatic resources in Lassen Volcanic National Park was made and studies of trout populations in Yellowstone and Kings Canyon National Parks were continued. It is the purpose of these studies to develop plans for management of park waters based on their physical, chemical, and biological characteristics. Special attention has been paid to lakes since they provide most of the fishing and offer the greatest opportunity for improvement of angling through proper management. However, with the decreased fishing intensity, there is less need for such studies at present and they will be discontinued until after the war. Fish for planting of park waters were supplied from Federal hatcheries. Hatcheries were operated in Glacier, Great Smoky Mountains, and Yellowstone National Parks. Eggs collected from Yellowstone waters and young fish were planted in national park and other public waters.

Federal refuge faunas.—An investigation of the Wichita Mountains Wildlife Refuge, Oklahoma, showed that the meager surplus forage which existed was not situated so that it could be used for grazing domestic livestock without seriously interfering with wildlife management. As a war economy, however, the better part of this surplus can be cut for hay without seriously disturbing conditions for wildlife. The herd of introduced pronghorn antelopes now numbers about 60. On the Sheldon National Antelope Refuge, Nevada, investigations were made of winter conditions in relation to game animals and of competition between wild game and domestic stock. A study was made of the 2,606 winter elk losses in the Jackson Hole region, Wyoming, of which 1,175 were on the National Elk Refuge. Many of these losses on the refuge were from necrotic stomatitis induced by the presence of squirrel-tail (*Hordeum jubatum*) in the hay, while those in the hills probably resulted from malnutrition on an overbrowsed range.

Other field and laboratory studies.—Because our scientists were engaged in war activities, little field progress was made on the biological survey of the State of Washington and none on those of other States. A report on a biological survey of the Aleutian Islands that has an important bearing on our war effort and reconstruction work neared completion. Continued studies of the marten were made in cooperation with the State of Montana, and a manuscript was in preparation on the habits, history, economics, classification, and distribution of American pumas. From surveys, an estimate of 6,748,414 big-game animals in the United States was made at the close of 1941, and a manuscript was completed for publication on "Our Big-game Resources, 1937-42," which discusses populations of big-game animals, their trends, and their relations on different classes of land. Consideration was given to the land-use aspect of the Alaska wildlife problem and to an inventory for major vegetative types of South-eastern Alaska and administrative reports thereon were made.

The Biological Survey's laboratories were used by more than 150 cooperative investigators, including many from the War and Navy Departments, the Office of Strategic Services, and the War Production Board. These investigators made use of our original maps and reports and were supplied with bibliographies and other material; and our scientists gave them information which was not procurable elsewhere.

A LOOK AHEAD

True conservation demands that consumption shall not exceed production. Even wartime pressures should not result in exceptions to this rule and if the policies of the Fish and Wildlife Service prevail, there will be no deviations in its field from this basic principle of sound animal husbandry. Previous wasteful handling of natural resources has again been made apparent by the great needs developed in the present war. Continuation of such waste would be suicidal. Hence conservation, in all of its phases, undoubtedly will be a major national objective after the war.

Doing post-war planning now is of great importance and it has been given attention not only by the Fish and Wildlife Service but, at our request or instigation, by State conservation departments and by sportsmen's organizations and other interested groups. Within the Service, planning has embraced improvement of ordinary activities and also a program of development for lands now in administration or to be acquired, which will provide widespread employment and advance wildlife conservation to new and greater levels.

Unnecessarily as well as necessarily, we have expended a great deal of wealth that we shall be unable to replace. On the other hand, wildlife fortunately is a renewable resource which, with proper management, cannot only be maintained but increased. Preserving it and at the same time profiting by conservative use of it is a great economic achievement—in fact it is one that should gratify the most practical-minded. Beyond that, successful conservation of some of our wildlife heritage for its own sake is an out-standing aesthetic accomplishment in which every citizen can take satisfaction.

Office of The Coordinator of Fisheries

IRA N. GABRIELSON, Deputy Coordinator

AMERICA'S fisheries have been called upon to produce their high-protein foods and their essential byproducts on an unprecedented scale during the war. So great is the need for canned and fresh fish, fish meal, and vitamin oil and industrial oils, that the industry has been asked to produce 6 billion pounds in 1943—more than a billion pounds in excess of its largest peacetime yield.

The fishing industry has felt the impact of war more than any other enterprise of comparable importance. Because its working tools and its manpower are peculiarly useful in actual military operations, its materials as well as its men were called into service early in the war. In some branches as many as half the vessels were requisitioned for coastal patrol, and for transporting munitions and food to defense outposts and theaters of combat. The hard fiber ropes and twines with which fishermen operate their boats and gear went to war on troop ships, warships, and cargo vessels. Fishermen's nets found a new and invaluable use in camouflage-operations. Putting to work their knowledge of the sea and their skill in handling boats, many fishermen entered the Navy, the Coast Guard, and the Merchant Marine.

The procuring of food and the essential byproducts of the fisheries, are also important wartime functions of fishermen and their boats and gear.

The Office of the Coordinator of Fisheries was established by Executive Order 9204, July 21, 1942, to give the fishing industry needed aid in solving its war-created problems. The Secretary of the Interior was designated Fishery Coordinator, and the Director and Assistant Director of the Fish and Wildlife Service later appointed by him as Deputy and Assistant Deputy Coordinator respectively. Authorized under the original order to assure the sustained production of aquatic food supplies and to coordinate fishery policies, plans,

and programs, the Coordinator of Fisheries received further authority over the production and processing of fishery products under Food Directive No. 2, issued by the Secretary of Agriculture on February 8, 1943.

To carry out these functions effectively the Coordinator's Office is organized on an area basis with a representative in each of 10 major commercial fishing areas in the United States and 1 in Alaska, and consultants have been appointed from the fishing industry. The central office personnel and field staff are members of the fishery divisions of the Fish and Wildlife Service, detached temporarily from their ordinary duties for this wartime service.

GAINS MADE IN TWO FIELDS

During its first year the Coordinator's Office has accomplished substantial gains in two principal fields: (1) providing or retaining the men and materials to carry on the work of fishing, and (2) assisting the industry in using its facilities at maximum efficiency in order to bring in every possible pound of fish.

The return of fishing boats no longer urgently needed by the Army or Navy is essential if the fishery yield is to be increased. Early in 1943 the return of floating equipment to the Alaska salmon industry was arranged. This permitted the canning of a large pack of salmon which, on June 30, totaled 662,800 cases as compared with 288,786 cases to the same date last year. A number of seiners have been returned to the important sardine and menhaden fisheries, and a few trawlers to the New England banks—a distinct gain to fishery production, since most of these boats are capable of catching 5 to 6 million pounds a year. There is still a critical shortage of boats, and efforts are being put forth to secure the return of additional vessels to active fishing.

The program of fishing vessel construction is progressing satisfactorily. Besides those authorized earlier in a straight preference rating, the Coordinator's Office has secured controlled material allotments for the construction of some 250 vessels. At the present rate, construction will amount to about 20 million dollars per year and will probably increase.

By expediting applications for priority ratings for fishing gear, shore equipment, plant construction, and repair, the Coordinator's Office has helped to clear the bottleneck which has retarded normal repairs and replacements. It has formally recommended for approval priority cases involving material and equipment for repair, replacement, and expansion of fishing gear, fishing boats, and shore

processing plants amounting to approximately one and a quarter million dollars. Authorization has also been granted for the establishment of stockpiles of marine engines in the amount of approximately 800 engines by dealers located in 40 cities. These engines are released on recommendations of the Coordinator's field representatives.

MANPOWER SHORTAGE AMELIORATED

By gaining recognition by the War Manpower Commission of fishermen and skilled labor in processing plants as workers performing a necessary war job, the Coordinator's Office has reduced the loss of manpower which was seriously hampering fishery production. Arrangements have also been made to restore certain classes of aliens to fishing.

Through arrangements with Coast Guard authorities, security regulations in coastal waters have been modified to minimize interference with fishing. Certain bombing ranges, located on highly productive fishing grounds, have been moved to less productive waters. In many instances, port restrictions on the movement of vessels, hours of fishing, and on the use of radio at sea have been modified or removed.

The decentralization of service functions of the Coordinator's Office among the 11 area coordinators has proved very successful. The services rendered by these field offices have been instrumental in adding many vessels to the fishing fleet through new construction and by return from the military services, by securing engines for fishing boats, obtaining priorities on repair materials, fishing gear, and equipment, and arranging for rationed allotments of food and fuel for fishing vessels. The area coordinators have also succeeded in having certain restrictions on fishing activities adjusted with benefit to production and have aided in bringing about the deferment, release from military service, or direct recruitment of a large number of fishermen or shore workers. In many areas they have been successful in promoting the production of new fishery products and in conducting promotional campaigns to increase production.

The Coordinator's Office has developed wartime programs of operation for the salmon and pilchard fisheries, which together account for more than a quarter of our total production of fish. The Alaska salmon industry is operating under a concentration plan, with the canning of salmon confined to 75 of the most modern and efficient plants, assuring effective use of labor and equipment and maximum production. On June 30 the coordinator announced a coordinated production plan for the Pacific pilchard industry, which annually

yields about 1 billion pounds of fish for canned sardines, fish meal, and oil. The pilchard production plan, worked out in consultation with representative fishermen, plant operators, and State conservation officials, is designed to provide an even flow of fish to the canneries and reduction plants. Under the ordinary distribution system, some plants stand virtually idle at intervals for lack of raw material, while others receive more fish than they can process. This year deliveries will be directed by dispatchers assigned by the coordinator to the principal ports.

At the mid-point of 1943, reports from most sections of the industry showed that production was running ahead of last year's figures by a satisfactory margin, justifying the assistance that has been given the fisheries and offering promise of more substantial future gains.

Office of Indian Affairs

JOHN COLLIER, Commissioner

[N REVIEWING the past 12 months, I think first of the Indian men and women in the uniforms of their country's armed forces. Eighteen thousand Indians are in the military services. Thousands fight overseas. Hundreds have already died in this war, and more will fall in the great offensive actions now beginning.

Deep in the jungles of New Guinea, Indian sharpshooters readily see through Japanese camouflage and fight with a ruggedness that has won them acclaim in the press. Indians served well with the armored divisions in the African desert campaign and contributed materially to the final Allied victory. Indian pilots, gunners, bombardiers, and radio operators man Flying Fortresses and other heavy bombers which raid important German industry. In the Mediterranean, in the Atlantic, in the Pacific, in Asiatic waters, Indians have convoyed precious cargo, on sea and in the air, and a few Indians are in the submarine service.

In the great offensive now beginning on European soil, Indians will continue to serve with distinction in almost every military job. These comrades in arms are the sons and grandsons of the toughest enemy we white Americans ever fought.

Their commanders speak highly of their prowess, and they are especially effective when several or more Indians are permitted to serve in the same company or unit. A Cherokee Indian, Lt. Joseph Woody Cochran, of Skedee, Okla., has received four medals: the Distinguished Flying Cross, the Air Medal, the Purple Heart and the Silver Star. Before entering military service, Lieutenant Cochran had obtained an Indian Service educational loan to attend Oklahoma A. & M. College. This year his wife repaid \$300 owing on the loan. Staff Sgt. Frankie Spindler, of Assiniboine Indian blood, who, I regret to report, was killed in action in Africa, received three medals: the Distinguished Flying Cross, the Air Medal, and the Purple Heart. Scores of Indians have received awards for distinguished service.

Some Indian jurisdictions report that 30 percent of the able-bodied men between the ages of 18 and 38 have gone to war; others report 40 percent and some 60 and 70 percent. By far the largest number of those inducted or enlisted are found in the Army. According to the War Department, 16,054 Indians entered the Army between June 1940 and May 1943. Several thousand more are found in the other military branches. More than 100 Indian women have joined the auxiliary military services.

These Army figures do not include Indians commissioned as officers. A few Indians have been wounded and have honorable discharges. A small percentage of Indians who were inducted have been returned to their homes because they did not speak and write English. These boys are more anxious than ever to learn English and they are now receiving special assistance from Indian Service teachers. In the largest non-English-speaking area, the Navajo country, the Wingate Vocational High School offers preinduction training to Navajos who desire to learn basic military English quickly. Army officers from a nearby ordnance depot have introduced military drill and calisthenics at the Wingate school.

INDIANS BACK THE ATTACK

Whenever the Indians hear that their country needs money, they give spontaneously. A Navajo, who had asked his superintendent whether it was true that the Government desired funds to fight the war, stated that he did not want the paper (a war bond certificate) if the Government would buy guns with his money. Eskimos of the little village of Kipnuk, distressed that some of their boys had been sent home because they did not speak and write English well enough for military service, held a meeting and decided they must help win the war. They collected and sent to the Juneau headquarters eight mink skins, one weasel skin, and \$16.50 in cash, left over from the season's trapping. The skins sold for \$118.30, and \$134.80 in war stamps was returned to the village of Kipnuk. Indian employees of the Service buy war bonds through the pay-roll allotment plan, and war stamps are the price of admittance to many tribal social gatherings.

I am unable to report how many millions of dollars the Indians have invested in war bonds and stamps. Only those Treasury bonds purchased with monies under the jurisdiction of the Federal Government are recorded in this office, and purchases in this category by individual Indians and by tribes total 5 million dollars.

Thousands of Indians have left their homes for war work. In the last 2 years, Indian Service vocational schools have trained and placed approximately 2,000 men and women in war industry. Certain war plants in the Oklahoma-Kansas area and on the West Coast have placed standing orders with Indian schools for all Indians who can be trained. Classes are also open to white persons, and age restrictions have been lifted. Many hundreds of Indians to whom Indian Service vocational schools are inaccessible have acquired skills for war employment through local NYA centers.

FOOD PRODUCTION INCREASED

Despite labor shortages and upheavals occasioned by the war, the Indians actually increased their food production in the calendar year 1942. They produced and sold more food during the past year than ever before. Indians in the continental United States raised 21 million dollars worth of food, including beef, fish, poultry, cereals and vegetables. Two-thirds of this was sold on the 1942 market. The rest was consumed at home. Their sales of livestock and livestock products alone totaled \$12,808,244. This compares with top livestock sales of 4 million dollars in the last war when meat prices rose higher and the quality of livestock was generally poorer than obtains today.

On the basis of Army rations, the Indians in 1942 sold enough beef, mutton, poultry and fish to feed 220,250 soldiers for 1 year; enough cereals to feed 367,103; enough potatoes and vegetables to feed 52,057; enough eggs to feed 47,769; enough fruits and tomatoes to feed 38,346; enough beet sugar to feed 42,076 and enough butter and other fats to feed 51,269; finally on the basis of 199 pounds of wool per year, the Indians marketed enough wool in 1942 to supply all the clothing requirements, including replacements, for 19,000 soldiers.

These production figures represent a marked increase in Indian farming operations. In 3 years ending January 1, 1942, Indians planted 150,000 additional acres in grain and cereal crops and enlarged their gardens by 3,265 acres. They also planted new fruit trees, nuts, edible soybeans, and other produce. At the end of 1932, the Indians owned 170,794 beef cattle. Ten years later, cattle holdings had increased to 320,727. During the same period their dairy herds had increased more than fourfold—from 11,314 to 49,468.

Several factors are responsible for this increase in farming activity and the resultant increased production. Prominent among these is the careful planning by Indian Service employees and Indians working together. An example is the contract furnished by the United Pueblos Agency staff to an Indian who is going to war and desires

to assign his farming equipment, land, and livestock to another operator to use in his absence. Under the direction of the Governor and the village council, the new operator agrees to maintain the enterprise, to contribute his share to village relief, and to give to the original owner on his return the same amount of equipment and livestock he owned before leaving.

In 1936, Indian Service employees of the Pine Ridge Reservation sat down with the adult members of the 35 families of the Red Shirt Table community to plan with them a livestock and farming program for the community. At that time the Red Shirt Table community was one of the most impoverished and demoralized communities on the reservation. Long periods of drought and depression had completely liquidated their livestock holdings, and practically the entire community was dependent upon public assistance. Beginning from scratch, this community has developed a livestock industry the net worth of which, at the end of the fiscal year, was approximately \$60,000. This past season they planted and harvested 130 acres of irrigated land, conducted a poultry enterprise which brought them for the year a net income of approximately \$5,000, and have built a community root cellar and a community canning kitchen. The constant planning together of Indian Service employees and members of the community has resulted in the establishment of better community government, more adequate education and health facilities, and has made the entire community aware of its problems and its possibilities for the improvement of their welfare.

TRIBES PLAN FOR FUTURE

On many other reservations similar planning has been going on between Indian tribal councils and Indian communities and representatives of the Indian Service. On the Fort Belknap Reservation these plans have resulted in considerable enlargement of the livestock industry of the reservation, and more effective use of the irrigated lands. On the Flathead Reservation, a program is being developed which will involve the use of tribal funds for land purchases and for the enlargement of credit facilities. On the Warm Springs Reservation, the tribal council has, for a period of 2 years, worked with representatives of the Indian Service in developing a reservation-wide program which includes land acquisition, restocking of certain of the ranges, and more effective control over their fishing industry. These are just a few typical examples of enterprises planned by Indians and Service employees working together.

Another factor responsible in no small degree for increased agricultural production by Indians has been the extension of credit facil-

ities. Up to July 1, 1942, the Federal Government, in cooperation with tribal corporations and credit unions, made 5,019 loans to Indians totaling \$3,186,727 from the IRA revolving credit fund. Repayments were less than 5 percent delinquent at the end of the year. Records of repayments for 1943 have not been compiled yet, but all indications are that fewer Indians will be delinquent in repaying their loans this year than ever before. A number of individuals have paid the interest on their tribal loans 2 years in advance, and some have paid 3 years in advance.

Another factor has of course been the increase in actual acreage of Indian lands through purchases and through the restoration to the tribes of lands once ceded to the Government to be opened to entry. Only a small amount of gratuity funds were appropriated for land purchases for the fiscal year 1943, but a number of tribes have continued to invest their tribal funds in sorely needed land.

While Indians are not ordinarily thought of as dirt farmers, the chief contribution the American Indian has made to American civilization is probably his agricultural plants, methods, and processes. Indians discovered methods of bringing wild plants under control and breeding them by seed selection long before the advent of the white man. Paramount among the food plants domesticated and developed by Indians and given directly or indirectly to the white man is corn, or maize. Others include the white potato, originally grown by the Indians in the Andes; tobacco; the many varieties of kidney and lima beans; cocoa; peanuts; pumpkins; squash; sweetpotatoes and tomatoes. It has been estimated that four-sevenths of the total agricultural production in the United States, measured in farm values, consist of economic plants domesticated by the Indians and taken over by the white man.

MRS. DANIELS, 89, DOES HER BIT

This contribution of Indians to agriculture is not entirely a matter of past history. Within the past 5 years horticulturists have developed the only variety of lima bean yet known to grow satisfactorily in high, dry country. The original seed for this new lima bean was contributed by an 89-year-old Navajo woman, Mrs. Rose Daniels.

Five years ago a representative of the Horticultural Field Station, Cheyenne, Wyo., visited Mrs. Daniels at her home on the Uintah-Ouray Reservation, Utah. In her odd little seed house, Mrs. Daniels showed the scientist bottles and cans filled with seeds that she had saved during most of her life. As a child, Mrs. Daniels had been stolen from the Navajo by the Whiteriver Apaches and sold to the Uintah Indians and finally to a Mormon pioneer, a Mr. Daniels of

Fort Bridger, Wyo., who later settled with her on the Uintah Reservation. Mrs. Daniels has gardened successfully during her long life, growing a variety of vegetables in a homemade irrigated plot. She had only three lima beans remaining in her seed can, but the scientist wrapped them carefully and took them to the experiment station. From this small beginning was developed a new variety of lima bean placed on the market for the first time this year. The bean is especially adapted to the short growing season of the high dry country of such areas as eastern Utah, Wyoming, and South Dakota.

The first rabbit brush to leave the State of Nevada last year for rubber experimentation was collected by Indian agricultural students at the Carson Indian School. The boys used homemade balers and baled a sufficient quantity of rabbit brush to enable the United States Tire Co. to make extensive tests for rubber content.

During the past year irrigation supplied water to some 540,000 acres of farm land on Indian reservations west of the Mississippi River. These lands, used by Indians and non-Indian farmers, have been devoted to the production of critical food crops urged by the War Food Administrator for the western area. The combined value of food produced on Indian-irrigated land amounted to 20 million dollars in 1942. In addition, power systems operated by the Indian Service in connection with these irrigation projects furnished 35,000 kilowatts, either directly or by interconnection, to copper and molybdenum mines, numerous manufacturing plants, city utilities, and other commercial and industrial consumers in the rural West. The San Carlos and Colorado River projects furnish power to relocation centers settled by 30,000 Japanese-Americans who had been removed from the West Coast, and also to an army camp in Florence, Ariz., where prisoners of war are interned.

In a recent report of the Department of the Interior to the War Food Administrator, the Indian Service submitted plans for irrigating an additional 156,500 acres of Indian land over a 5-year period at a total cost of 16 million dollars. If adopted, the program would provide for increased food production valued at \$7,601,000 the first 2 years of operation and would also create post-war employment and farm areas for ready occupancy by Indians returning from the war and from industrial centers.

LAND YIELDS WAR MINERALS

A number of essential war minerals are obtained from Indian lands. Lead, zinc, oil, and gas are produced in large volume. Copper, vanadium, asbestos, gypsum, and coal are produced in small quantities.

The Indian Service has responsibility for general oversight of mineral production on Indian lands. Some of the technical phases are handled by the Geological Survey. Certain aspects are subject to final approval by the Secretary. The scope of this work is indicated by the volume of business handled during the fiscal year, which included: Approval of 900 mining leases, the issuance of prospecting permits covering many thousands of acres, the development and approval of plans for the commingling of ores in order to increase production, the sale of certain tribally owned deposits of coal to the Defense Plant Corporation, and the assignment to the United States of an oil lease for Indian land on which a deep-test well revealed the presence of helium gas. Revenues to the Indian owners of these minerals thru royalties, rentals, and bonuses are estimated to exceed 5½ million dollars yearly.

The Indian Service, in cooperation with other Government agencies and with the Indian landowners, is encouraging the discovery of new deposits of strategic minerals, increased production from known reserves of low-grade ores, and the introduction of simplified procedures to make mineral deposits immediately available.

WOMEN IN LUMBER MILLS

From Indian-owned forests this year came timber for war construction totaling almost a half billion feet valued at 2 million dollars. Included are the Sitka spruce used in the construction of training planes, elm and oak, from which the ribs of ships are hewed, and Douglas fir and Western hemlock, which go into plywood for airplane construction.

A significant source of lumber in the Great Lakes area is the Menominee Indian Mills, Inc., at Neopit, Wis. As 200 Menominee men serve in the armed forces and others are away from the reservation in war jobs, production of lumber had to be curtailed until Menominee Indian women were called to replace the men.

May 3, 1943, marked the first time women ever worked directly in Menominee mill operations. Thirty Indian women made possible the return of the second shift which was discontinued for 3 months because of the manpower shortage. The women have learned to pick and sort stock, work on the chipper, and bundle lath. They also do general clean-up work in the mills and cooking in the lumber camps. About 50 additional women will be available for mill jobs this fall if plans for a nursery school can be carried out.

More than 50 Menominee women have been regularly employed to work in the forests, carrying out the blister rust eradication program

which was formerly manned by Indian CCC employees. They are driven to the work by Indian women truck drivers.

BOMBING RANGES PROVIDED

Over many thousands of acres owned by Indians, few white men have trod. The War Department has found much of this land suitable for bombing ranges, airports, and other military uses because of the poor quality of the land and its remoteness from centers of population.

More than 400,000 acres on the Pine Ridge Reservation, South Dakota, were sold to the War Department for bombing ranges, necessitating the evacuation of 128 Sioux Indian families. These families were safely moved to new homes on recently purchased land and credit has been extended to them for the purchase of cattle and farming equipment. Smaller tracts of land have been sold or leased to the War Department on the Kiowa Reservation, Oklahoma; on land belonging to the Five Civilized Tribes, also in Oklahoma; on the Tulalip Reservation, Washington; on the Pima and Papago Reservations, Arizona; on Pueblo lands, New Mexico; on the Blackfeet Reservation, Montana, and on the Fort Hall Reservation, Idaho.

The road-building program of the Indian Service during the past year was restricted to the construction of roads leading to vital war materials. The completion of a road to a vanadium mine on the Navajo Reservation made possible the doubling of the mine's output of this essential mineral. Likewise it has been possible to obtain additional logs from Indian-owned forests and saw mills by completing several roads. The development of asbestos mining has necessitated plans for a road covering a section of an Apache Reservation which only Indians have heretofore traversed.

With 50 vacancies among Indian Service physicians and 150 vacancies among the nurses, the Indian Health Service is hard put to keep its organization together, and only by working overtime and with assistance from other employees can the excellent record of our physicians and nurses in caring for the Indians' health be maintained. Despite these handicaps the record of achievement of the Indian Health Service continued to be impressive.

The death rate among the Indians has dropped 53.3 percent in the past 12 years, and they are continuing to gain in numbers slightly faster than the general population. Of some 430,000 Indians in the United States and Alaska, 401,384 are under Federal jurisdiction.

Additional hospitals, trained medical personnel, modern schools, and an improved economic status for the Indians have all contributed

to lowering the death rate among them. The Indian birth rate has fallen about 25 percent in the past 12 years, but this is more than compensated by the sharp reduction in Indian deaths.

"SULFA" TREATMENT FOR TRACHOMA

One of the most common and ancient diseases of mankind is trachoma, an eye affliction. The disease is contagious, intensely painful, blurs the vision, and often results in partial blindness and occasionally, total blindness. According to Indian Service physicians who have been treating Indians for this disease during the past half century, trachoma is caused by a virus. The Indian Service introduced sulfanilamide treatment in 1939, and the trachoma incidence among Indians dropped from 30 to 7 percent in the fiscal year 1942 and to 5 percent during the past year. The "sulfa" treatment is more economical from the point of view of time and effort and pain than any other treatment yet developed, and does not injure the eye tissues as have some of the harsh external treatments. Indian Service physicians have made a comprehensive survey of trachoma and of their experiences in administering the "sulfa" treatment. Their findings will be made available to the medical world in a paper to be published soon.

Several years ago an Indian Service physician was assigned to study the food habits of certain Southwest Indian communities. He had previously found serious nutrition deficiencies in the diet of western Shoshone children who, after being given the needed vitamins in their school lunches, immediately began to progress in school. This specialist has found the foods of Southwest Indian communities markedly deficient in certain nutritive values. The only products natural to the area containing the desired food values and easily accessible to the Indians are pine needles and, among the Papago, a certain cactus. To supply this need, employees are experimenting with bean sprouts, drawing on the Orientals' long experience in this field. In the Pueblos area, fish ponds were planted this past year to supply a source of food whose nutritive values are not represented in any other foods in the present diets of the Indians.

During the past year four Indian hospitals were closed, and the Tomah, Wis., Indian school and hospital were turned over to the War Department. Indians who would otherwise go to the hospitals at Leupp and Toadlena on the Navajo Reservation and to Towaoc on the Consolidated Ute jurisdiction will be cared for in other Indian Service hospitals. Local contracts have been made with private

physicians to care for Indians of the Sac and Fox jurisdiction in Iowa and in the Tomah area in Wisconsin.

The State sanatorium of North Dakota has set aside 50 beds for the use of the Indian Service in treating Indians who have tuberculosis. Thirty-one of the thirty-two Turtle Mountain Indians known to have active tuberculosis are now under treatment at the State sanatorium, a record which any community in the United States might well envy.

Adequate health and school facilities are still lacking in some remote Alaska communities, but Alaska natives generally have had better service the past year because of the presence of our military forces in the Territory. Army, Navy, Coast Guard, and Marine officials have cooperated in epidemics and emergencies, either by supplying medical treatment or by furnishing rapid transportation for the natives to medical centers.

LARGEST HOSPITAL COMPLETED

Because of war demands for building materials, few new buildings were constructed, but the Indian Service was fortunate in completing within the past year the largest hospital that it has ever built. The Tacoma hospital was started July 1941. Total cost of the principal building and the dozen buildings attached to it, including quarters for physicians and nurses, a laundry and commissary, was approximately \$1,300,000.

Commanding a view of Tacoma, Wash., and Mount Rainier on the east and the Olympic Mountains on the west, the hospital building is six stories from the basement to the auditorium, contains 350 beds and a fully-equipped out-patient department. It serves the Indians of the Northwest and Alaska. With the shortage of medical personnel, only 250 beds are now in use, but excellent doctors may be called in an emergency or for consultations from Tacoma.

The modern fireproof buildings finished in light buff brick with a limestone trim replace 56 obsolete frame buildings formerly used as an Indian school, and following the last World War as a veterans' facility.

In June 1942, the Japanese Army occupied certain islands in the Aleutians, bringing the war to the very doorsteps of the Alaska Indian Service. On Attu live 45 Aleuts and two Indian Service employees, Mr. and Mrs. Charles Foster Jones. According to a boat operator who visited the island of Attu several months prior to the Japanese invasion, Mr. Jones had planned with the natives the total destruction of their oil and gas stores, radio, and other equipment

which might be of value to the Japanese. Jones had also trained the natives as a small army and said they expected to resist if the Japanese landed.

The 63-year-old Jones couple were offered the Attu post in 1941 because of their long successful experience in Alaska and because they were versed in many skills and were extremely adaptable. Mrs. Jones was a qualified teacher, social worker, and trained nurse. Mr. Jones, who had spent his earlier years prospecting for gold in the Far North, was an experienced radio operator and could repair and maintain many types of machinery. The Weather Bureau needed a radio operator to report the weather on Attu, which has been described as the weather factory of the world. Until a few hours before the Japanese invasion, Jones reported weather schedules hourly to the Alaska Defense Command in addition to performing his duties as an Indian Service special assistant.

THE JONESES VS. TOJO

Early in the spring of 1941, the Joneses carefully considered the possible dangers on Attu and then accepted the new post with enthusiasm. Transferring from Old Harbor, Alaska, they arrived on Attu in August 1941. Mrs. Jones' letters to the Juneau headquarters praised the native village as clean, progressive, and intelligent. Mr. Jones wrote discussing plans for introducing reindeer on the island to supplement the natives' income from fishing and trapping. After Pearl Harbor Mr. and Mrs. Jones were asked to discuss with the natives the possibility of evacuation to the mainland until after the war. Their answer in the face of daily threats radioed from Tokyo was that they preferred to take their chances and defend their island home. By the time the authorities had decided that evacuation was a military necessity and shipping arrangements were completed, it was too late to reach Attu. The fate of the Aleuts and of the Joneses is still unknown to the Service.

The Aleut people living on the islands of Atka, Akutan, Kashega, Makushin, the Pribilofs, and Unalaska were safely removed to villages in southeastern Alaska before any persons were injured or captured by the Japanese. The 477 Pribilof Islanders who were moved to Funter Bay, the site of an abandoned fish cannery, are under the jurisdiction of the Fish and Wildlife Service. The remainder of the Aleuts received Indian Service assistance.

The hundred other native families were furnished the lumber and tools with which to build cottages for themselves at their "duration" homes on the Alaskan mainland. For people who come from a land

where no trees grow, the Aleuts performed well with hammers and nails. According to an Indian Service official who supervised their resettlement at Ward Lake, the Aleuts built many houses from foundation to roof in a single day—complete with electrical wiring, hardware, windows, doors, and three or four rooms. The total cost of each house was less than \$150.

The Aleut evacuees have had no difficulty in obtaining employment or in earning a livelihood from fishing and trapping since settling in their new homes.

According to newspaper reports, Alaska's Indians and Eskimos make fine civilian soldiers in the Territorial Guard under the direction of the Governor. On familiar terrain, the natives can be of great assistance to the military authorities as guides and scouts. In many native villages, Indian Service teachers and nurses are responsible for organizing the natives in civilian defense units, and, under their guidance, native women have prepared many bandages and other materials for first-aid use.

Although the Indians were better off financially this past year than they have been in years, nevertheless a number of families continue to need assistance. The Welfare Division through its social workers and other Indian Service employees has assisted the Indians in filing applications for the family allotments, insurance, maternity and infant care which they are entitled to while members of their families are serving in the armed forces.

The food stamp plan administered by the Surplus Marketing Administration was abolished January 1, 1943. This method of administering relief to needy Indians proved greatly superior to methods employed by the Indian Service since its early history. A recent ruling of the Comptroller General permits the Government to make cash payments to needy Indians. This method, for many Indians, is preferable to the issuing of rations or purchase orders, the system which had been in effect for many years prior to the food stamp plan.

TRIBAL COURTS AND POLICE

Maintaining law and order on Indian reservations is primarily the responsibility of the tribes themselves, who have their own tribal courts and tribal police. The Indian Service assists by encouraging tribes to adopt law and order codes and by providing a corps of 30 special officers who give guidance to Indian judges and Indian police and who in addition handle violations of certain criminal statutes, especially the Federal Indian liquor law.

Indian courts and Indian justice continue to operate satisfactorily, especially in close-knit Indian communities and in those areas where Indians and non-Indians are not living side by side. By far the large majority of the Indians are law abiding. Indian police and Indian judges need additional training and advice, but the Indian Service's Law Enforcement Staff, regrettably, is not large enough to contribute more in the field of training.

One thousand four hundred and forty-eight Federal and State criminal convictions were handled in 1942 by the special officers of the Indian Service. Nine hundred and sixty-two were non-Indians. Violations of the Federal law prohibiting the sale of liquor to Indians continues to be the most common offense and represents 75 percent of the crimes prosecuted by this Office. In 1942 the fines paid by non-Indians for violating this law totaled \$15,800.22, while fines paid by Indian offenders were less than one-tenth as much, or \$1,185.06.

The Menominee Advisory Council approved the appointment during the past year of their first woman judge, Mrs. Rhoda House. Judge House has an excellent approach to problems of family relationships, according to reports, and her desire to determine the causes and alleviate the conditions resulting in crime has contributed to a reduction in juvenile delinquency on the Menominee Reservation, Wisconsin.

The Indian Service, during the past year, has had to give increased attention to problems arising in centers where Indians have been employed in war industries. Many hundreds of Indians are away from their homes and engaged in war work. Unfortunately, the general misconception persists that an Indian, no matter where he may be, is the special problem of the Federal Government rather than a citizen entitled to recognition by the courts, by private charity and public welfare organizations. Consequently, many problems of law and order, housing and other aspects of social welfare are often referred to the Indian Service instead of being handled by local agencies.

Some Indians have their own solution. Families from Laguna Pueblo, New Mexico, now employed on the railroads, have reestablished in the towns of Gallup, Winslow, and Richmond, their traditional hierarchy of a lieutenant governor and council. These leaders are responsible for solving all the human problems which arise in the temporary work colonies. They administer justice and relief and direct community activities.

TRIBAL CODES ENFORCED

Likewise, the Florida Seminoles, several hundred of whom are employed in agricultural work away from the reservation, cling to their

where no trees grow, the Aleuts performed well with hammers and nails. According to an Indian Service official who supervised their resettlement at Ward Lake, the Aleuts built many houses from foundation to roof in a single day—complete with electrical wiring, hardware, windows, doors, and three or four rooms. The total cost of each house was less than \$150.

The Aleut evacuees have had no difficulty in obtaining employment or in earning a livelihood from fishing and trapping since settling in their new homes.

According to newspaper reports, Alaska's Indians and Eskimos make fine civilian soldiers in the Territorial Guard under the direction of the Governor. On familiar terrain, the natives can be of great assistance to the military authorities as guides and scouts. In many native villages, Indian Service teachers and nurses are responsible for organizing the natives in civilian defense units, and, under their guidance, native women have prepared many bandages and other materials for first-aid use.

Although the Indians were better off financially this past year than they have been in years, nevertheless a number of families continue to need assistance. The Welfare Division through its social workers and other Indian Service employees has assisted the Indians in filing applications for the family allotments, insurance, maternity and infant care which they are entitled to while members of their families are serving in the armed forces.

Consequently, many problems of law and order, housing and other aspects of social welfare are often referred to the Indian Service instead of being handled by local agencies.

Some Indians have their own solution. Families from Laguna Pueblo, New Mexico, now employed on the railroads, have reestablished in the towns of Gallup, Winslow, and Richmond, their traditional hierarchy of a lieutenant governor and council. These leaders are responsible for solving all the human problems which arise in the temporary work colonies. They administer justice and relief and direct community activities.

TRIBAL CODES ENFORCED

Likewise, the Florida Seminoles, several hundred of whom are employed in agricultural work away from the reservation, cling to their

family or clan relationships with a head man to enforce tribal moral codes. In their migrations from one seasonal job to another, the Seminoles create no housing problem, preferring their open thatched palmetto chikis to any kind of house that white men have yet devised. A large sugar beet corporation which has been nationally praised because of the clean, attractive town provided for its workers was forced to provide, in a recent contract signed with Seminole workers, for the use of a truck for gathering palmettos. The Seminoles chose to build their traditional shelter rather than live in the company houses.

Large numbers of Indians have been employed in jobs and in areas where they had never been employed prior to the war. Some 300 Sioux Indians were employed during the growing and harvesting season in the Platte Valley in Colorado. Four to six hundred Navajos were located along the Arkansas River between the town of Pueblo, Colo., and the Kansas border. Three to four hundred Navajos work in mines at Morenci, Ariz. More than 300 Pimas and Papagos work in mines at Ajo, Ariz. Some 800 Navajos load shells at the Fort Win-gate Ordnance Depot in New Mexico. Several hundred Navajos are employed in the Sacramento Valley, Calif. Additional hundreds from dozens of different tribes are scattered through the West.

Representative Karl Mundt, of South Dakota, has placed before the House Committee on Indian Affairs a resolution to investigate the administration of Indian Affairs and to determine whether or not the Indians have received benefits under the Indian Reorganization Act. I record here some of the remarks I made at committee hearings on the Mundt resolution:

The Indian Reorganization Act fits the need of any Indian group whose members live and work in the same neighborhood or reservation. It fits those who have kept their ancient ways and those who have changed to modern ways. Its basic principle is that men need to organize, and that democratic organization protects and strengthens, and does not endanger or weaken, individual responsibility and rights.

However, the Indian Reorganization Act does not require Indians to organize. It is solely permissive. A tribe which has brought itself under the act is free to postpone organization indefinitely. Or it may organize politically (under a constitution) and never organize industrially (under a charter). The actual record to date is as follows:

192 tribes (130,704 Indians) accepted the act.

88 tribes (100,000 Indians) have adopted constitutions.

68 tribes (69,753 Indians) have received charters of incorporation.

In addition, the Indians of Oklahoma and the natives of Alaska were blanketed in by Congress.

POLITICAL AND ECONOMIC ORGANIZATION

It goes without saying that Indian political and industrial management under the Indian Reorganization Act has not been perfect. Human affairs are not ever perfect. Majorities sometimes are unwise, sometimes are tyrannical. Legislative and executive representatives and officers sometimes are incompetent, or partisan, or corrupt. This is human life and it is Indian life. We believe that an examination of Indian organized life under the Indian Reorganization Act (and also, outside the Indian Reorganization Act) will show that it compares very well indeed with white organized life. Indian organization has produced a very impressive release of energy, and increase of purposeful effort and of economic production, among the tribes. It has, too, furnished a greatly needed outlet for exiled and suppressed emotion among the tribes; and if in some places it has brought into being debate, political excitement and even political uproar among some Indians, that, it would seem is to the good. Certainly it is our traditional and valued American way. To give body and form to this summary concerning the Indian Reorganization Act, I supply briefly a single example. It is taken from an article which I wrote for the *Atlantic Monthly*, September 1942.

"The several Apache bands were crushed in war and were then held for two generations in idleness. They were governed by authority immovable though not unkind. The Mescalero Apaches in southern New Mexico live amid 400,000 upland and high mountain acres. Nine years ago their land was used by white lessees. Six out of seven in the tribe inhabited a camp slum clustered about the Indian agency. The Government in preceding years from time to time had endeavored to lure or force the Mescaleros out from their noisome camp and back onto the land. In vain; authority failed, and inducement, and argument to the individual failed. Death doomed, robbed of their war-way, the Mescaleros had regressed, and they silently immured themselves in their despondency.

"To Santo Domingo Pueblo in 1934 the Mescaleros' delegates came. The draft of the Indian reorganization bill was being presented, and the Pueblos said 'Indeed and of course, for this is our own old-time day.' Incredulous, the Mescaleros went home.

"Congress passed the Reorganization Act. The Mescaleros were informed: It is the law. The law says that you must yourselves decide, for yourselves, whether you want to be free. You are required to make this choice, and it may be forever.

"They chose freedom, and then they realized that it was they themselves who must plan their future life. Tribes under the Reorganization Act may formulate political constitutions which thereafter only they or Congress can change, and they may adopt corporate charters empowering them for the whole range of business enterprise. The Mescaleros framed a constitution and charter, and earth and life began to emerge under a clear light, a light new and yet known from long ago. A miasma of collective regression started to fade away.

"Utilizing a government loan—there have been no delinquencies in repayment—the Mescaleros abandoned their slum camp and resettled themselves out where farming and cattle-running could supplement each other. Their net income from cattle jumped from \$18,000 to \$101,000 in 3 years. They closed out all leases to whites and they now use their entire range and built up its herbage and soil while using it. Their farm crops multiplied eightfold in value in 3 years. These figures are indices merely. Long-range economic planning has become a matter of course with the Mescaleros. Their energies surge. They have their war-way once more, their chance for combat, for leadership, the endless universal war-way wherein nature is antagonist and collaborator in one. Among the Mescaleros

as among all the other tribes that have organized under the new policy, women and men have equal duties and privileges."

ADJUSTMENT TO WAR CONDITIONS SOUGHT

The in-service summer school was not held in 1942, but the replacement of many former employees with persons unfamiliar with Indian Service necessitated a session this year. Two hundred and eighty employees attended the summer school which was held during the month of June 1943 at Haskell Institute, Lawrence, Kans. The courses were designed to help teachers adjust to wartime conditions. One of the most popular classes attended by 75 women offered actual experience in repairing and maintaining mechanical equipment, refrigerators, locks, stoves, plumbing and laundry facilities, such as are attached to Indian Service schools in areas in which there is no mechanical assistance for many teachers.

The Indian Service supervisor in the management and marketing of Indian-owned livestock instructed employees in stock-raising, animal feeding, sanitation, and the construction of shelter for livestock and poultry. In order to increase local meat supplies, some employees received instruction in the care of rabbits and the building of rabbit hutches from second-hand materials which are easily available. Teachers and school principals from the Southwest were especially interested in classes in chemical gardening and in the sprouting of beans, and grew crops while they were at Haskell.

In a 25- by 50-foot greenhouse at the United Pueblos Agency, Albuquerque, N. Mex., one Indian Service employee is already growing vegetables with chemicals in his spare time for consumption in the schools and hospitals under that jurisdiction. Lettuce is ready for the table 29 days after planting the seed. A small section of the greenhouse yields 65 pounds of green vegetables each week.

Indians have dried meats, vegetables, and berries by simple methods for ages, but only within the last few years has the Indian Service begun experimentation in modern dehydration. A number of Indian Service schools have installed dehydration plants. The Indian Service boarding school at Phoenix, Ariz., has pioneered in this field with the cooperation of the Department of Agriculture. During the past year, Phoenix Indian School furnished a year's supply of dehydrated fruits and vegetables to the Eklutna, White Mountain, and Wrangell Boarding Schools and six Indian Service hospitals, all located in Alaska, and in addition preserved many types of food for its own use. The commandeering of transportation facilities to meet military needs greatly increases the desirability of dehydrated foods both for civilian

and military consumption because of the smaller shipping space required for foods that have been dried. Also, dried foods do not spoil. Oranges, grapefruit, onions, beets, potatoes, carrots, corn, beans, cabbage, and spinach are among the foods that are being dehydrated successfully. All but 4 percent of the moisture is usually extracted in the process.

"EARTH BRICK CONSTRUCTION" PUBLISHED

Indian Service educators issued a revised book list of recommended reading for schools and also compiled an extensive bibliography of materials for schools in wartime. The long-awaited publication entitled "Earth Brick Construction" by Elbert Hubbell, specialist in building with native materials, appeared this year. The booklet contains instructions, plans, and illustrations for building with adobe and asphalt stabilized earth bricks, an economical type of construction which is growing in popularity in many parts of the West.

The fourth booklet in the Indian handicraft series, *Crafts of the Ojibwa*, by Carrie A. Lyford, appeared this year. Also published were additional school readers written by Ann Nolan Clark and illustrated by Indian artists, including four in the Sioux-English bilingual series, *The Pine Ridge Porcupine*, *The Slim Butte Raccoon*, *The Grass Mountain Mouse*, and *There Still Are Buffalo*, and Mrs. Clark's first reader in the Spanish-English series, *Young Hunter of Picuris*. These booklets are printed by Indian student printers in Indian school print shops, and as many of the youths have gone to war, Indian girls are assisting in the shops at Haskell and at Sherman Institute, Riverside, Calif. The pamphlets may be purchased at 50 cents each from Haskell Institute, Lawrence, Kans.

Publications emanating from the University of Chicago's study to determine the extent to which Indian native autonomy in the United States has been affected by the many years of Federal rule will begin to appear in the fall of 1943. Indian Service physicians and teachers worked many extra hours during the past year to assemble the necessary information, administer scientific tests and make physical examinations of 1,000 selected children between 6 and 18 years of age. These children live in 11 communities on the Hopi, Navajo, Pueblo, Papago, and Pine Ridge jurisdictions.

Few governmental agencies have undertaken so exhaustive an analysis and criticism of their work and its results. Already for those Federal employees engaged in the fact-finding, the research has provided valuable in-serving training. The study is under the direc-

tion of Dr. W. Lloyd Warner, professor of anthropology and sociology, and Dr. Laura Thompson, coordinator of research.

Designed to provide the basis for sounder education and adjustment of aboriginal peoples whose cultures now in transition are overshadowed by industrial civilization, the study of factors molding Indian personality may indirectly benefit the 30,000,000 Indians in the Americas. It has international sponsorship by the Inter-American Indian Institute, and a similar study is being undertaken in Mexico.

LATIN-AMERICANS VISIT U. S. RESERVATIONS

The National Indian Institute, having sent representatives to Latin-American countries during the past 2 years to acquire some understanding of their vast Indian problems, was able this year to offer practical training to a group of 11 distinguished Latin-American technicians and rural educators who visited U. S. Indian Reservations. The Research Fellows came from the countries of Bolivia, Ecuador, Peru, Guatemala, Mexico, Panama, Haiti, and El Salvador. Sharing their time with other Federal agencies, the Latin-Americans spent from 3 weeks to 4 months studying U. S. Indian administration. Several representatives visited the Sioux country in the Dakotas, but they concentrated their studies on southwest reservations because climate, soil, and other factors there more closely approximate those which are found among their own rural Indians. Also our largest Spanish-American population lives in the Southwest.

The Research Fellows also learned something of the administrative mechanics of the Indian Service in its headquarters. They interviewed officials in Chicago and Washington and visited the summer school for Indian Service employees at Haskell Institute.

This preliminary Latin-American in-service training furnished such rich experiences to the Research Fellows and to the Indian Service that we hope an exchange of experiences between the United States and those countries having aboriginal peoples may continue. The Indian Service is in a position to offer more intensive training over a longer period, actually encouraging representatives of other countries to understudy those Indian Service positions here which correspond with theirs at home and to meet and solve problems as they arise.

PERSONNEL CHANGES, LOSSES, NUMEROUS

Like many other agencies, the Indian Service has experienced the most rapid changes and losses among its own personnel in its history.

Eight hundred and thirty-eight regular employees have left for military service; others have transferred to agencies more directly responsible for the war program.

There are probably few employees throughout the Indian Service who are not performing more duties than their job-sheets describe in order to meet the war emergency. Teachers have been asked to guard the forests in lieu of fire look-outs. They have been asked to perform clerical work in the agency and hospital offices. In many instances, one employee is performing the work that two employees performed prior to the war, and in some instances, one employee has replaced three.

This has been made possible by the introduction of improved systems of statistical reporting and in-service training. A new machine tabulation system now being introduced in Indian Service hospitals is expected to reduce clerical work performed by the nurses and physicians 20 to 25 percent.

The recent law requiring payment of time and a half for official time worked beyond 40 hours a week has raised employee-morale considerably. I am aware that employees often work many hours beyond 48 hours a week because of seasonal and other exigencies. School and agency headquarters are often the only places from which an Indian can telephone, obtain a doctor's services, or whatever else may be needed in an emergency. Indian Service employees in the field cannot adhere to a daily or weekly time schedule, nor would a rigid schedule be desirable in administering to human needs in rural areas.

The wartime shortage of personnel and the fact that the bulk of the headquarters staff is now located 800 miles from Washington are bringing about a few long-needed changes in procedures. Additional authority has been delegated to Bureau heads, and the consequent simplifying of procedures is resulting in the saving of time and the elimination of needless correspondence. For example, certain legal problems of the Indians may now be referred directly to the field offices of United States attorneys. Thus, in April and May 1942 the legal staff received 589 communications from the Department of Justice as compared with only 195 such communications in the same months of this year, a decline considerably in excess of 50 percent.

Other changes are taking place throughout the headquarters and the field staffs. The small library and information staffs have been consolidated in order to effect economies in the answering of inquiries. The news magazine, *Indians at Work*, in which many inquiries of a general nature are answered, was formerly published monthly but now appears every other month. Among the magazine's readers are Indian

soldiers in New Guinea, Africa, England, and Alaska. They have written letters to thank the Bureau for the magazine.

The war has not curtailed the number of Indian estates to be probated, but the probate staff is reduced from four attorneys and two clerk-stenographers prior to August 1942 to the present chief probate attorney, one attorney, and one clerk-stenographer. There remain eight examiners of inheritance in the field offices. During the fiscal year, 1,403 cases were received by the probate staff, and despite the greatly reduced personnel, the work is as current as usual, only 50 cases awaiting attention. Probate matters involving the Five Civilized Tribes and the Osage Nation are handled separately. Through the efforts of the Indian Service, Indians of the Five Civilized Tribes were saved \$163,876.70 in the disposition of 995 cases in the county courts, and 143 cases in Federal, State supreme, and district courts. For the Osage Nation, 141 cases were disposed of in the Federal, State supreme, and district courts while 216 Osage cases are pending. Many Osage estates are very valuable and cases often remain in the courts for years.

MISSION TO ARABIA

At the request of King Ibn Saud, who is attempting to acquire modern equipment and methods to improve the economic lot of his people, the chief engineer of the Indian Service, A. L. Wathen, J. G. Hamilton, of the Department of Agriculture, who formerly worked on soil conservation on the Navajo Reservation, and K. S. Twitchell, who has spent many years in Arabia, comprised the first U. S. Agricultural Mission to Saudi, Arabia. Mr. Twitchell had recommended to the State department, which sponsored the mission, that persons having technical experience in enhancing the economic opportunities of the Indians of this country be members of the mission. The mission traveled more than 11,000 miles in Arabia by automobile, donkey and camel, and visited places not previously seen by white persons. Every courtesy was extended to the Americans during their 10 months' stay by the King and the friendly Arabs. In the Hedjas mountains along the Red Sea, they found terraces that had been constructed probably thousands of years ago and are still maintained in good condition by the Arabs. They also found that, contrary to popular opinion, drainage is a principal requirement for the increase of crop production, particularly along the Persian Gulf, because of numerous springs that flow uncontrolled. Their findings and recommendations were published by the State department this year in English and in Arabic for the use of King Ibn Saud and his advisers.

SERVICE ADMINISTERS RELOCATION PROJECT

We continued through the year to administer the War Relocation project on the Colorado River Indian Reservation in Arizona. As reported last year, this center was built by the War Department to house 20,000 Japanese and persons of Japanese descent who had been evacuated from the West Coast. The project is composed of three separate camps which are located south of Parker, Ariz., and below that portion of the reservation occupied by the Colorado River tribe. Altogether, 10 of these centers were developed for the War Relocation Authority and while only the center on the Colorado River reservation is operated by the Indian Service, two others, the Gila River center and the Leupp Detention Camp, occupy Indian lands.

Throughout the year our attention was mainly occupied with the construction phases of this project. The digging of irrigation canals and laterals and drains, the subjugation of land, the building of a trunk highway into the town of Parker, with secondary roads and streets within the three camps, and the building of schools and quarters for administrative personnel consumed the greater part of the funds and manpower which were available to the project. The housing provided by the Army engineers consists of simple barracks of the theater of operations type, covered with tar paper, which afford little protection from the extreme summer heat or from dust, which hangs in clouds over the camp much of the time. Little could be done to modify the basic housing, but in the construction of schools adobe brick has been used. This has the advantage of being economical and of providing insulation against extremes of temperature.

As the construction period draws to a close, and it is anticipated that most of the public works will have been put in operation by this fall, emphasis will shift to food raising. For the time being it is planned to cultivate about 5,000 acres, most of which will be planted to vegetables, with some feed for livestock. Already, hogs and poultry are being raised in sufficient quantity to meet the needs of the evacuees. The center is now almost self-sustaining in certain basic foods, requiring only the purchase on the outside of dairy products and beef. During the quarter ending June 30, 1943, a total of 540,000 pounds of vegetables was produced. No industrial activity is contemplated except for minor production of processed foods and clothing, with some woodcraft and carving, artificial flowers and minor art work.

COUNCILS FUNCTION IN EACH CAMP

Particular effort has been devoted to organizing the evacuees as a community. A temporary governing council was first elected in each

of the three camps and while the camp population gained familiarity with its problems and opportunities, discussion went forward in the formulation of a municipal charter. Such a charter was recently adopted by popular vote and permanent councils now function in each camp. There is also a general council composed of representatives of the camps.

While the center provides food, shelter, health care, and education, all basic needs, it cannot provide for the many personal requirements of the evacuees. Laundry and dry-cleaning, shoe repairs, barbering and manicuring, and miscellaneous household goods and staples must be paid for out of cash wages (wage scales of \$12, \$16, and \$19 per month are in force) or out of savings which the evacuees brought with them. Canteens were established as soon as the center was opened and in time these canteens were handling a volume of business amounting to several thousand dollars daily. This enterprise is now organized on a cooperative basis. As in the case of the development of community government, this step was taken after months of educational work and after it had been submitted to popular vote.

The project has maintained from the beginning a social analysis section, the purpose of which was to keep a day-to-day objective record of community events, administrative decisions, and evacuee sentiments. The materials of such a record then furnish points of reference for the analysis of community opinion at any time or for prediction as to what this opinion may be at some future time, in given circumstances. It is an attempt to develop a technique by which an administrative agency dealing with people can gauge its effectiveness in directing the efforts or meeting the needs of such people.

A POST-WAR PROBLEM

The great exodus of Indians from their homes confronts the Indian Service with a number of post-war problems.

Should economic conditions after the war continue to offer employment opportunities in industry, many Indians will undoubtedly choose to continue to work away from the reservations. Never before have they been so well prepared to take their places among the general citizenry and to become assimilated into the white population. Between 1934 and 1942, an extensive program of adult education was carried on throughout the reservations. Many, as CCC enrollees, learned to operate jackhammers, to weld, to drive bulldozers, and to maintain and repair all kinds of equipment. Under the Public Works program, large numbers of Indians were employed in the construction of schools and hospitals on reservations. In the road-building program of the

past ten years hundreds of Indians became proficient in the operation of heavy machinery, in surveying, and other skills involved in road construction and maintenance.

In addition, the vocational schools were much more proficient and each year several hundred young people were graduated directly from schools into skilled jobs. Since 1930 the Indian Service has devoted much effort to rehabilitation of the reservation resources, but this very program was the best possible training Indians could have received for off-reservation living. It will be no surprise, therefore, if a sizable proportion of those Indians now away from home continue in urban industrial employment during the post-war period.

PLANNING POST-WAR PROJECTS

If, on the other hand, the war is followed by a period of depression and unemployment, the majority of those who are now away from their homes will return to the reservations. To enable these thousands of returning soldiers and workers to find work opportunities, I have asked Indian Service technicians to assist the Tribal Councils to intensify their plans for the fullest use of reservation resources, and to supplement these by plans of a public works character. According to a preliminary estimate several million dollars worth of improvements in the rehabilitation of the soil and forests, the adjustment of a complicated land ownership problem, the construction and improvement of many miles of roads, and the building or reconditioning of scores of schools and hospitals are urgently needed on Indian reservations. Indian Service architects and engineers are now preparing plans and making estimates of probable costs, and of the number of Indians who can be absorbed by such work.

The Federal Works Agency and the U. S. Army Engineers requested the Indian Service to make plans for a town site located at the terminus of the Alaska Highway. The plans were furnished to these agencies during the past year, but because of the shortage of shipping facilities, construction of the town will not get under way for some time.

Many Indians returning home will want to take up where they left off in livestock farming, lumbering, fishing, and other reservation enterprises.

Whether Indians of the post-war era remain at home or find their way into the outside world they are going to be much more critical of conditions both local and national. The old ties of home and tribe, the ancient ways of dealing with problems of sickness, of marriage, of relations of youth to elders, these and many others will undergo change

as the youth receive new ideas from the far corners of the world. Promises made over many years: rights as citizens, self-government, political equality, economic rehabilitation, will take on increased meaning. Young people coming back from service in the armed forces are going to demand that the American people make good on these promises. They will no longer tolerate the discrimination of special liquor laws which make it a Federal offense to sell liquor to an Indian. Many Indians in uniform have been turned away from bars where other soldiers, white, Negro, Japanese, Philippine, were being served.

On behalf of the Navajo boys at an Army camp, a Navajo soldier recently wrote his superintendent, "We do not understand the kind of citizenship that says we can fight but not vote." In 1924 the Congress declared all Indians to be citizens, but several States with large Indian populations still disfranchise the Indians.

HOW THE SERVICE SERVES

In this report I have sought to describe the work of the Indian Service very largely by reporting the accomplishments, the needs, and the desires of the Indians themselves. It is the function of the Service to give guidance and assistance to the Indians where they need it. In many Indian communities, Indian Service employees serve on Selective Service boards. They implement OPA rationing machinery in Indian country. They advise the Indians on the filing of income tax returns, on the purchase of War Bonds and on their many other responsibilities to a nation at war which demands the united participation of all its people, including its non-English speaking Indian and Eskimo citizens living thousands of miles from our great population centers. Service employees have suggested to the Indians that they brush up on English before enlisting or that they find someone to carry on their farming enterprises before leaving home. Our task is to try to answer their questions, to interpret for them new forms and regulations which apply to many of them for the first time.

These new conditions facing the Indians have demanded a continual recasting of the functions of the Indian Service. With acute shortages of manpower, it has been necessary to simplify procedures, to assign new and different tasks to personnel, and to eliminate all activities except those directly connected with the war or essential to the welfare of the Indians. This recasting of functions will continue so long as the Nation demands increased production of minerals, timber, and food to achieve a victorious peace.

Board on Geographical Names

MEREDITH F. BURRILL, Director

THIS Board, established in 1890, is the official authority on the use of geographic names by the Federal Government and is the agency charged with bringing about uniform usage of geographic nomenclature and orthography. The Board decides all disputed questions concerning geographic names; determines, changes and fixes place names within the United States and its Territories and possessions; maintains central files of information on geographic names; prepares gazetteers and standardizes procedures for preparation of gazetteers by other agencies and establishes rules for guidance and standard procedures for naming hitherto unnamed places and for transliterating geographic names from languages that do not use the Latin alphabet. The Board also serves as an informal authority in non-Government use of place names and gives information on these names, their pronunciation and their locations from its extensive files. Pronunciation of place names has assumed an importance which it has never had before, by reason of the combination of radio broadcasting and the interest in war names all over the world. Governmental agencies, the press, and radio are being assisted in their use of geographical names as an important step in bringing about uniform usage. The Board also maintains contact with comparable agencies in foreign countries looking toward the development of uniform geographic nomenclatures and orthographies.

During the latter part of the fiscal year, the Board has been enlarged and reorganized primarily to perform functions required in connection with the operations of the armed forces. The enormous increase in map production by the armed forces not only calls for a correspondingly large number of name decisions, but requires that they be made promptly. Use of varying names for a place or feature on military maps not only complicates the geographical name prob-

lems by wide circulation of improper names, but also creates confusion in field operations, the accurate transmission of messages and the transportation of materials and men.

Many geographical names in foreign countries have quite different forms when transliterated or translated and may have more than a single form in the language of the country. These foreign name problems are being dealt with in a wholesale manner by the promulgation of standard rules and procedures for treating names in specific foreign countries or regions and by the preparation of gazetteers, place name indexes and special lists of alternate names and geographical positions. Simultaneously, decisions are being rendered on the most pressing questions involving individual geographic names. These actions have made possible the uniform usage of names on a large number of maps and charts made by several agencies for use by the armed forces.

Procedures have been improved by division of labor and specialization of personnel to make decisions at the rate of hundreds per week; to answer a constant flow of inquiries concerning these and other geographical names, and to assemble and maintain the necessary files and records. Staffing of the reorganized Board, which will have a total personnel of 135, including approximately 45 professional geographers—most of whom will be regional specialists devoting themselves to a particular part of the world—was still in progress at the end of the fiscal year. Since there was no precedent for many of the specialized positions, intensive training programs have been devised to train the nonprofessional personnel for this work. A remarkable increase in production has been achieved in a brief period. The Board's library now includes more than 2,500 bound volumes, 1,000 pamphlets, 55,000 separate maps and a large number of atlases.

During the fiscal year prior to the reorganization of the Board, 284 decisions were rendered by the executive committee at 11 meetings. A cumulative report is being prepared which will include these and all previous name decisions, totaling some 24,000.

Division of Personnel Supervision and Management

MRS. J. ATWOOD MAULDING, Director

MANPOWER and its utilization has been the major problem of the Division during this fiscal year as it has been in the whole Nation, and our efforts have been largely directed toward its solution with relation to the Department's needs. In the early fall of 1942 the Secretary of the Interior called upon the bureaus and offices of the department to canvass their personnel situations and to determine whether (1) any activities not essential to the war program could be discontinued or postponed; (2) any time-consuming procedures and record keeping could be eliminated during the war program; (3) any rearrangements of work might be made which would release employees or make the filling of existing vacancies unnecessary; (4) any employees not being used at their highest skills or to their fullest capacities could be assigned more effectively within the bureau; and (5) whether training programs could be inaugurated to meet specialized needs. The bureaus diligently went about putting their houses in order.

The Division has given more than usual attention to the fullest utilization of the Department's own personnel to avoid drawing on the outside manpower pool, and its inventory of employee qualifications has aided not only in recruitment but has provided better individual placement. Some idea of the success of the Division's efforts is indicated by the fact that during the calendar year 1942, 71 percent of the vacancies above the entrance grades in the District of Columbia were filled from within the Department. This process, of course, was far from sufficient to meet the greater needs of our war program which demanded specialized experience. A particularly difficult situation has been the recruitment of engineering aids for the Geological Survey's strategic mapping program. All known sources of recruitment have been tapped; at the request of the Department and the Civil Service Commission, qualifying courses have been introduced

in a number of universities and colleges, and the Department has even appealed to the families of its own employees to provide trainees.

In the recruitment process the policy has been to secure as many women, older men and physically handicapped persons as might be found qualified. It is significant that at the end of this fiscal year the Department has 1,500 more women on its rolls than it had when Pearl Harbor was attacked. Many older physicians in the Indian Service communities have been employed to meet the shortage, and many other older men and physically handicapped persons have demonstrated their ability to carry on for our men who have entered the military service, of whom there were approximately 5,000 at the close of the fiscal year.

On March 12, 1943, the Secretary designated a Committee on Deferral of Government Employees for the Department to carry out the provisions of Executive Order No. 9309 of March 6, 1943. The committee is composed of the Assistant Secretary as chairman, the Director of the Bureau of Mines and the Director of Personnel. Because of the specialized war work which is being done in the Department, and which requires professional and technical employees, and because of the scarcity of replacements in these fields, a considerable number of draft deferment requests have come before the committee.

The unusual scarcity of qualified stenographers compelled the Division to carry on throughout the year a training session for the orientation of new appointees and for bringing those of substandard qualifications to a productive level. Other training projects were carried on, an outstanding one being a course in departmental administration involving the general subjects of administration, fiscal accounting, personnel, office and property management and public relations.

During the year classification procedures were studied, simplified, and accelerated. The classification office acted upon 21,530 cases. Effective February 1, 1943, regulations were issued providing for the application of a 25-percent differential to salary classification rates outside of continental United States.

During the year over 60,000 personnel actions were processed. This number is higher than in previous years, partly due to a higher rate of turn-over which averaged 31.9 percent in Washington and 55.4 percent in the field.

Certain acts of Congress which became effective during the fiscal year had an important bearing on the work of this Division. Public Law 821, approved December 22, 1942, and Public Law 49, approved May 7, 1943, provided for overtime pay and compensation. Public Law 806, approved December 17, 1942, provided for an accumulation

of annual leave up to 90 days. The Revenue Act of 1942 provided for a Victory Tax deduction; and later in the fiscal year the Current Tax Payment Act of 1943 required a withholding tax from the salaries of employees.

The transfer of the Indian Office, National Park Service and Fish and Wildlife Service to Chicago early in the fiscal year required some adjustment in processing procedures. Pay roll and leave work formerly handled in the Division was also decentralized to the bureaus. During the fiscal year there were 27 retirements for age, 77 optional retirements and 38 for disability. Fifteen employees were reemployed after reaching retirement age.

The number of grievance cases and disciplinary actions in the Department during the year was small and my observation is that the morale of employees throughout is high. The staff of the Division while working under trying conditions has cooperated to the fullest extent in carrying out the responsibilities placed on them.

Office of the Solicitor

WARNER W. GARDNER, Solicitor¹

THE chief task of the Solicitor's Office during the past year has been the development of streamlined processes designated to channel the resources of the Nation into use in the war program. Impediments to the mobilization of war resources, created by a national coal strike, shortages of oil, power, and transportation, and a variety of obsolete laws and cumbersome administrative practices, were dealt with, and very largely overcome. To make possible swift action on matters of first importance the legal machinery of the entire Department had to be streamlined and the accumulations of old cases that impeded prompt legal action had to be liquidated. That efforts in this direction were reasonably successful is indicated by the fact that the work of the Solicitor's Office was substantially on a current basis at the close of the fiscal year.

While the chief efforts of the Department's lawyers were directed toward clearing the channels of national war production, constant vigilance was maintained against inroads upon the permanent interests of the Nation in the conservation of its natural resources and in the preservation of the civil rights of its citizenry. A difficult coal strike situation was so handled that the Department has cast no discernible shadow upon any of the rights of the 3,000 coal operators and half-million miners involved. The civil rights of the citizens of Hawaii and Puerto Rico were vigorously protected and amplified, despite the close impact of the war upon these island territories. In Hawaii the Department was successful in securing a substantial restoration of civil authority, which had been temporarily surrendered to the military on the day of Pearl Harbor. In the case of Puerto Rico the Solicitor's Office devoted much energy to the mapping of

¹ Nathan R. Margold resigned office on July 9, 1942, and Felix S. Cohen served as Acting Solicitor until August 26, when Mr. Gardner took office.

appropriate legislative measures for the strengthening of Puerto Rican self-government. The natives of Alaska found respect accorded to land rights which had long been violated or ignored; exclusive possession of six areas was assured to Indian and Eskimo groups in the first application of the act of May 1, 1936 (49 Stat. 1250); the War Department officially agreed to recognize the aboriginal rights of Alaskan natives in the large areas taken over for military purposes and the Department reaffirmed its recognition of aboriginal fishing rights in Alaskan coastal waters.

Seeking to combine efficient utilization of natural resources with a scrupulous regard for human rights and long-range national interests, the lawyers of the Department have had to meet new problems and new demands with prompt and resourceful counsel. If at the end of the year the Department can look back and see the accomplishments of the operating bureaus which fill the preceding pages of this volume, rather than a series of unsurmounted legal problems, then the attorneys of the Department can feel that they have done their job.

In the effort to streamline the legal work of the Department an extensive reorganization plan was mapped out and initial steps were taken toward its effectuation. The purpose was to centralize the professional supervision of legal service, while providing for more nearly complete legal service within the several bureaus, and for greater decentralization in administrative and fiscal matters on the Bureau level. The legal personnel work of the Department was coordinated under the direction of the Solicitor, and steps were taken to centralize in the Office of the Solicitor all legal work involving litigation, property acquisition, patent law, fiscal matters and personnel law. At the same time, the assignment of attorneys formerly carried on the Solicitor's pay roll to the pay rolls of the various Bureaus and Divisions of the Department made possible a substantial reduction in the budget of the Solicitor's Office.

LEGISLATION

Adjustment of the machinery of government to war needs was a primary objective in the departmental legislative program of the past year. Although substantially limiting its drafting efforts to legislation of importance to the prosecution of the war, the Legislative Division participated in drafting some 61 statutes which were enacted by the seventy-seventh and seventy-eighth Congresses during the past fiscal year. Another 40 or so statutes affecting the Department were enacted after the submission of reports prepared or reviewed by

this Division. Perhaps the most important of the statutes affecting the work of the Interior Department enacted during the past year is the Columbia Basin Project Act of March 10, 1943 (Pub. Law 8, 78th Cong.), providing for nonspeculative settlement of a vast agricultural area in family-size farming units, as a part of the Columbia Basin project.

MINES

The expansion of Bureau of Mines activities, under the impact of pressing war needs, carried with it a growing burden of legal work for the Mines Division of the Solicitor's Office. Urgent military requirements for helium required the making of contracts for the enlargement and construction of processing plants, as well as a series of additional contracts with owners of oil and gas wells, manufacturers of equipment, and other interested parties. Other contracts for the erection of pilot plants and related facilities for metallurgical investigation, special contracts covering exploratory drilling for strategic minerals, and cooperative agreements between the Government and various schools, universities, and other research institutions, added to the drafting work of the Mines Division.

The work of the Division under the Federal Explosives Act of December 26, 1941 (55 Stat. 863), shifted in emphasis during the past year from the initial development of a system of control to the actual enforcement of the act and the regulations. During the year more than 80 violations were reported to the Department of Justice and a number of convictions were secured. Forty proceedings were instituted for the revocation of licenses, and of those concluded, 20 terminated in license revocation. In no case has the holder of the revoked license appealed from the decision. Considerable effort has been directed toward securing the cooperation of State officials in the enforcement program. This has involved analysis of State laws, extensive correspondence and negotiation with State officials, and the preparation of model State legislation, adopted by the Council of State Governments as part of its program of State war legislation proposed to the State legislatures convening during the year.

Among other principal activities, the work of the Mines Division in connection with the general revision of bituminous coal prices culminating in the Secretary's minimum price order of September 30, 1942, and the preparation of Secretarial Order No. 1763, defining the rights of the Government in inventions by employees, together with the subsequent administration of that order, deserve particular mention.

PROPERTY ACQUISITION

The work of the Property Acquisition Division has in large measure been turned into wartime channels. It has handled the legal work involved in the acquisition of three helium plant sites, together with pipe line rights-of-way and gas reserves for the future, and plant sites for sponge iron development work. It has stationed two attorneys in the field to conduct the title work in connection with the war mineral exploration program. The title work formerly done in the General Land Office has been transferred to this Division, with apparent savings in manpower and time. Including also the land acquisitions of the National Park Service and of Indians and Indian tribes, there have been about 2,200 matters disposed of during the fiscal year. At the years' end, no piece of work had been in the Division for as long as a month.

PUBLIC LANDS

The Public Lands Division has continued to implement the conservation policy of Congress and of the Department with respect to the public lands and natural resources. It prepared a number of departmental decisions upholding the interest of the public in mineral deposits. One of these revoked an order which had the effect of limiting potash permits to a very few persons; another held that sodium borate lands are disposable by lease without loss of title to the Government, and a third held that certain extensive railroad grants are limited to rights-of-way for railroad purposes without impairing the right of the United States to the underlying minerals. The Division has handled three cases in the District Court of the District of Columbia; it was successful in all of them. The Division has prepared new Department-wide regulations on practitioners which, after issuance by the Secretary, replaced the archaic rules which have been in force for many years. It has contributed to the speedier conduct of Department affairs by establishing the legality of extensive delegation of powers by the Secretary to six of the Department's bureaus. While the flow of work has continued at substantially the same volume, about 6,100 items a year, the number of pending matters at the close of the fiscal year, 160, is at a record low.

The General Land Office continued its large-scale cooperation with the War and Navy Departments and by the end of the fiscal year had made available a total of more than 15 million acres of land for military purposes; in addition, lands and mineral deposits were withdrawn for the use of the war subsidiaries of the Reconstruction Finance Corporation. Included within the total of more than 35,000 items

relating to the administration of the public lands, the legal staff participated in drafting legislation and orders which would stimulate development of needed mineral resources.

The legal work in the Geological Survey has related in the large to the oil and gas leases on the public domain, including the approval of plans for the unitized development and operation of oil and gas areas. In the latter connection a procedure was developed through which the proposed general regulations for unit plans were published with an invitation to interested persons to file criticisms and suggestions, as a result of which hearings will be held to insure the fairest possible regulations.

The legal staff of the National Park Service has been reduced by about one-half, consistent with the diminished operations of the Park Service, with the result that a somewhat heavier individual burden has been handled by the remaining part of the staff. Slightly less than 200,000 acres of land were added to the Park Service areas during the fiscal year. Perhaps the major part of the legal issues has related to the problems raised by the contracted staff and program of the Park Service and the ways in which the areas may be administered and protected pending their full post-war use. The work of the legal staff, as of the Service in general, has been carried on under the additional handicap of the transfer of headquarters from Washington to Chicago.

CONSERVATION

The Conservation Division, in addition to its customary duties, has taken on new work in the course of the year. It has assumed the review of the work relating to the Office of the Coordinator of Fisheries, and the questions of personnel and fiscal law have been centralized in this Division. With the establishment of a formalized responsibility for these questions, they have grown considerably in number and it is to be supposed that the Department has received corresponding advantage from expert counsel on these questions.

The legal work of the Division of Territories has been shaped by the extraordinary impact of the war upon our Territories and island possessions. An example is the organization of central control of imports into Puerto Rico and the suspension of the coastwise shipping laws for Puerto Rico in order to help meet the threat of mass starvation which submarine sinkings and shipping shortages brought to Puerto Rico in the summer of 1942.

The legal work of the Fish and Wildlife Service has adapted itself, although handicapped because of removal of the headquarters of that Service to Chicago, to the war needs, requiring a diminution in the

wildlife refuge program and a corresponding increase in the functions relating to commercial fisheries. Executive Order No. 9204 of July 21, 1942, established the Office of Fishery Coordination, and Food Directive No. 2 of the Secretary of Agriculture delegated to the Secretary of the Interior the food production powers conferred upon the Secretary of Agriculture by Executive Order No. 9280 of December 5, 1942, so far as these powers related to the production of fish. Under the authority of this order, regulations were prepared which served to concentrate and to utilize more effectively the equipment of the Alaskan salmon industry and the pilchard industry on the west coast.

The services of the Legal Division of the Bureau of Reclamation were largely directed during the past year to the preparation of contracts for the construction of dams and reservoirs and for the disposition of power and irrigation water developed thereby. Although War Production Board orders late in 1942 suspended construction on a number of Bureau projects, incidentally giving rise to many novel legal contract problems, the negotiation of long-range programs of water control proceeded at an accelerated pace. Interstate compacts relating to the Republican, Belle Fourche, Yellowstone, and Missouri Rivers, the Columbia Basin project, and the Central Valley project demanded a considerable part of the energies of the legal division of the Bureau, together with many other smaller projects. In the field of litigation the Bureau conducted or participated in a number of cases, including cases dealing with: (a) the scope of the Secretary's authority to contract with individual water users (*Fox v. Ickes*, 137 F. (2d) 30 (U. S. C. A. pp. D. C., 1943)); (b) the valuation of reservoir and power sites (*United States v. Washington Water Power Co.*, 135 F. (2d) 341 (C. C. A. 9, 1943)); and (c) the limits of State and Federal authority in interstate streams (*Nebraska v. Wyoming and Colorado* (pending before U. S. Supreme Court)). Except for an adverse decision in the intermediate appellate court in the case of *Fox v. Ickes*, the cases which reached decision were won.

The legal work of the Grazing Service has been accomplished under unusual difficulties due to the fact that three chief counsel have been on duty during the course of the fiscal year, one having entered the military service and the second having retired because of ill health. However, the legal work was current at the close of the year.

INDIANS

The task of keeping Indian property in the hands of the Indians demanded legal action by the Indian Division on a wide front against

a variety of adversaries—defaulting lessees, adverse claimants under old railroad grants, State tax collectors, and ordinary trespassers. The policy of congressional protection of Indian homesteads was put to the test in argument before the Supreme Court in the case of *Board of Commissioners v. Seber* (No. 556, Oct. term, 1942, decided April 19, 1943), in which tax officials of Oklahoma sought to deny the Constitutional power of Congress to exempt Indian homesteads from State taxation. The argument of the Solicitor in support of congressional power was upheld by a unanimous court. He registered a less complete success in the case of *Oklahoma Tax Commission v. United States* (Nos. 623, 624, 625, Oct. term, 1942, decided June 14, 1943), where the court upheld the exemption of restricted lands in Oklahoma from State inheritance taxation but, by a five to four vote, declared restricted funds to be subject to such taxation in the absence of clear congressional enactment to the contrary. Other important Indian litigation included *United States v. Garaventa Land and Livestock Co.*, 129 F. (2d) 416, upholding the right of the Pyramid Lake Indians in reservation lands occupied for many decades by squatters; *Arenas v. United States*, — F. (2d) —, upholding the tribal status of Palm Springs Reservation lands; and *United States v. Santa Fe Pacific Railroad Co.*, 314 U. S. 339, in which, following a favorable decision in the Supreme Court (1941) further proceedings were initiated in the trial court looking to the recovery of land and damages under the formula established by the Supreme Court. While the protection of Indian rights of property and personality represented the most important part of the work of the Indian Division, the exigencies of war placed upon the Division a number of special responsibilities involving the maximum utilization of Indian resources in the program of war production. During the current year the backlog of old cases which once acted as a drag upon the application of legal energies to current problems was substantially eliminated and the work of the Indian Division is now on a current basis.

The Legal Division of the Office of Indian Affairs, in addition to its usual load of routine legal business, had to handle a number of peculiarly complex problems arising out of the war. The acquisition of extensive Indian lands for military purposes created not only difficult problems of land acquisition but equally difficult problems relating to the resettlement of the Indians concerned. A task of peculiar complexity handled by the Legal Division of the Indian Office was the negotiation of many-sided agreements with Indian water users and others to make possible diversion of water required for production of badly needed copper in Arizona. The Probate Division of the Indian

Office, despite severe setbacks through loss of personnel to the armed services, and by reason of the moving of its offices and records to Chicago, managed to keep its work close to a current basis and to take on a considerable increase of jurisdiction conferred by the act of December 24, 1942 (Public Law 833, 77th Cong.) which transfers probate jurisdiction over small restricted estates of Five Civilized Tribes Indians from the State courts to the Secretary of the Interior.

Division of Information

ROBERT W. HORTON, Director

DURING the past fiscal year the Division of Information has maintained in skeletal form the editorial, photographic, radio and publication sections authorized by Congress in 1938.

Dissemination of official information through the daily press, the radio, pictures and in printed publications generally has been limited to the preparation and distribution of such pertinent facts and regulations as those dealing with the Federal administration of the Nation's coal mines, and to information concerning the Department's programs for the development and conservation for war purposes of metals, power, oil, fuel, helium, food, land, water, and timber.

Important economies in the use of postal facilities and paper supplies were effected during the year, and the distribution of all publications of the Department was restricted to conserve manpower and materials. The educational work of the motion-picture unit, drastically curtailed during the fiscal year ending June 30, 1942, was suspended this year for the duration of the war.

RADIO SECTION

With the increasing use of radio in those United Nations' war activities which originate in this country, the Radio Section with its modern broadcasting and recording studios, proved of great value to many agencies of the Government.
